CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

22 Gold and Silver Medals now awarded.

REGISTERED TRADE MARK
THE FOUR OAKS.

When ordering your seeds, don't forget the "Four Oaks" Gold Medal Specialities.

SUPPORT BRITISH INDUSTRY.

All Gardeners are now discarding the old-fashioned foreign-made Knapsacks and buying THE LATEST AND BEST IN SPRAYING MACHINES.

The "FOUR OAKS" KNAPSACK SPRAYER.

(Protected by Royal Letters Patent.)

Weight, 14 lbs.
Capacity, about 3½ gallons.

Acknowledged by all who have seen same to be

THE SIMPLEST and yet the BEST KNAPSACK SPRAYER ever produced.

A CHILD CAN WORK IT.

THE ONLY MACHINE WITH FORCE BEHIND THE SPRAY.

This one point alone places the "FOUR OAKS" KNAPSACK right in front of all other Knapsack Machines, yet this is only one improvement out of many.

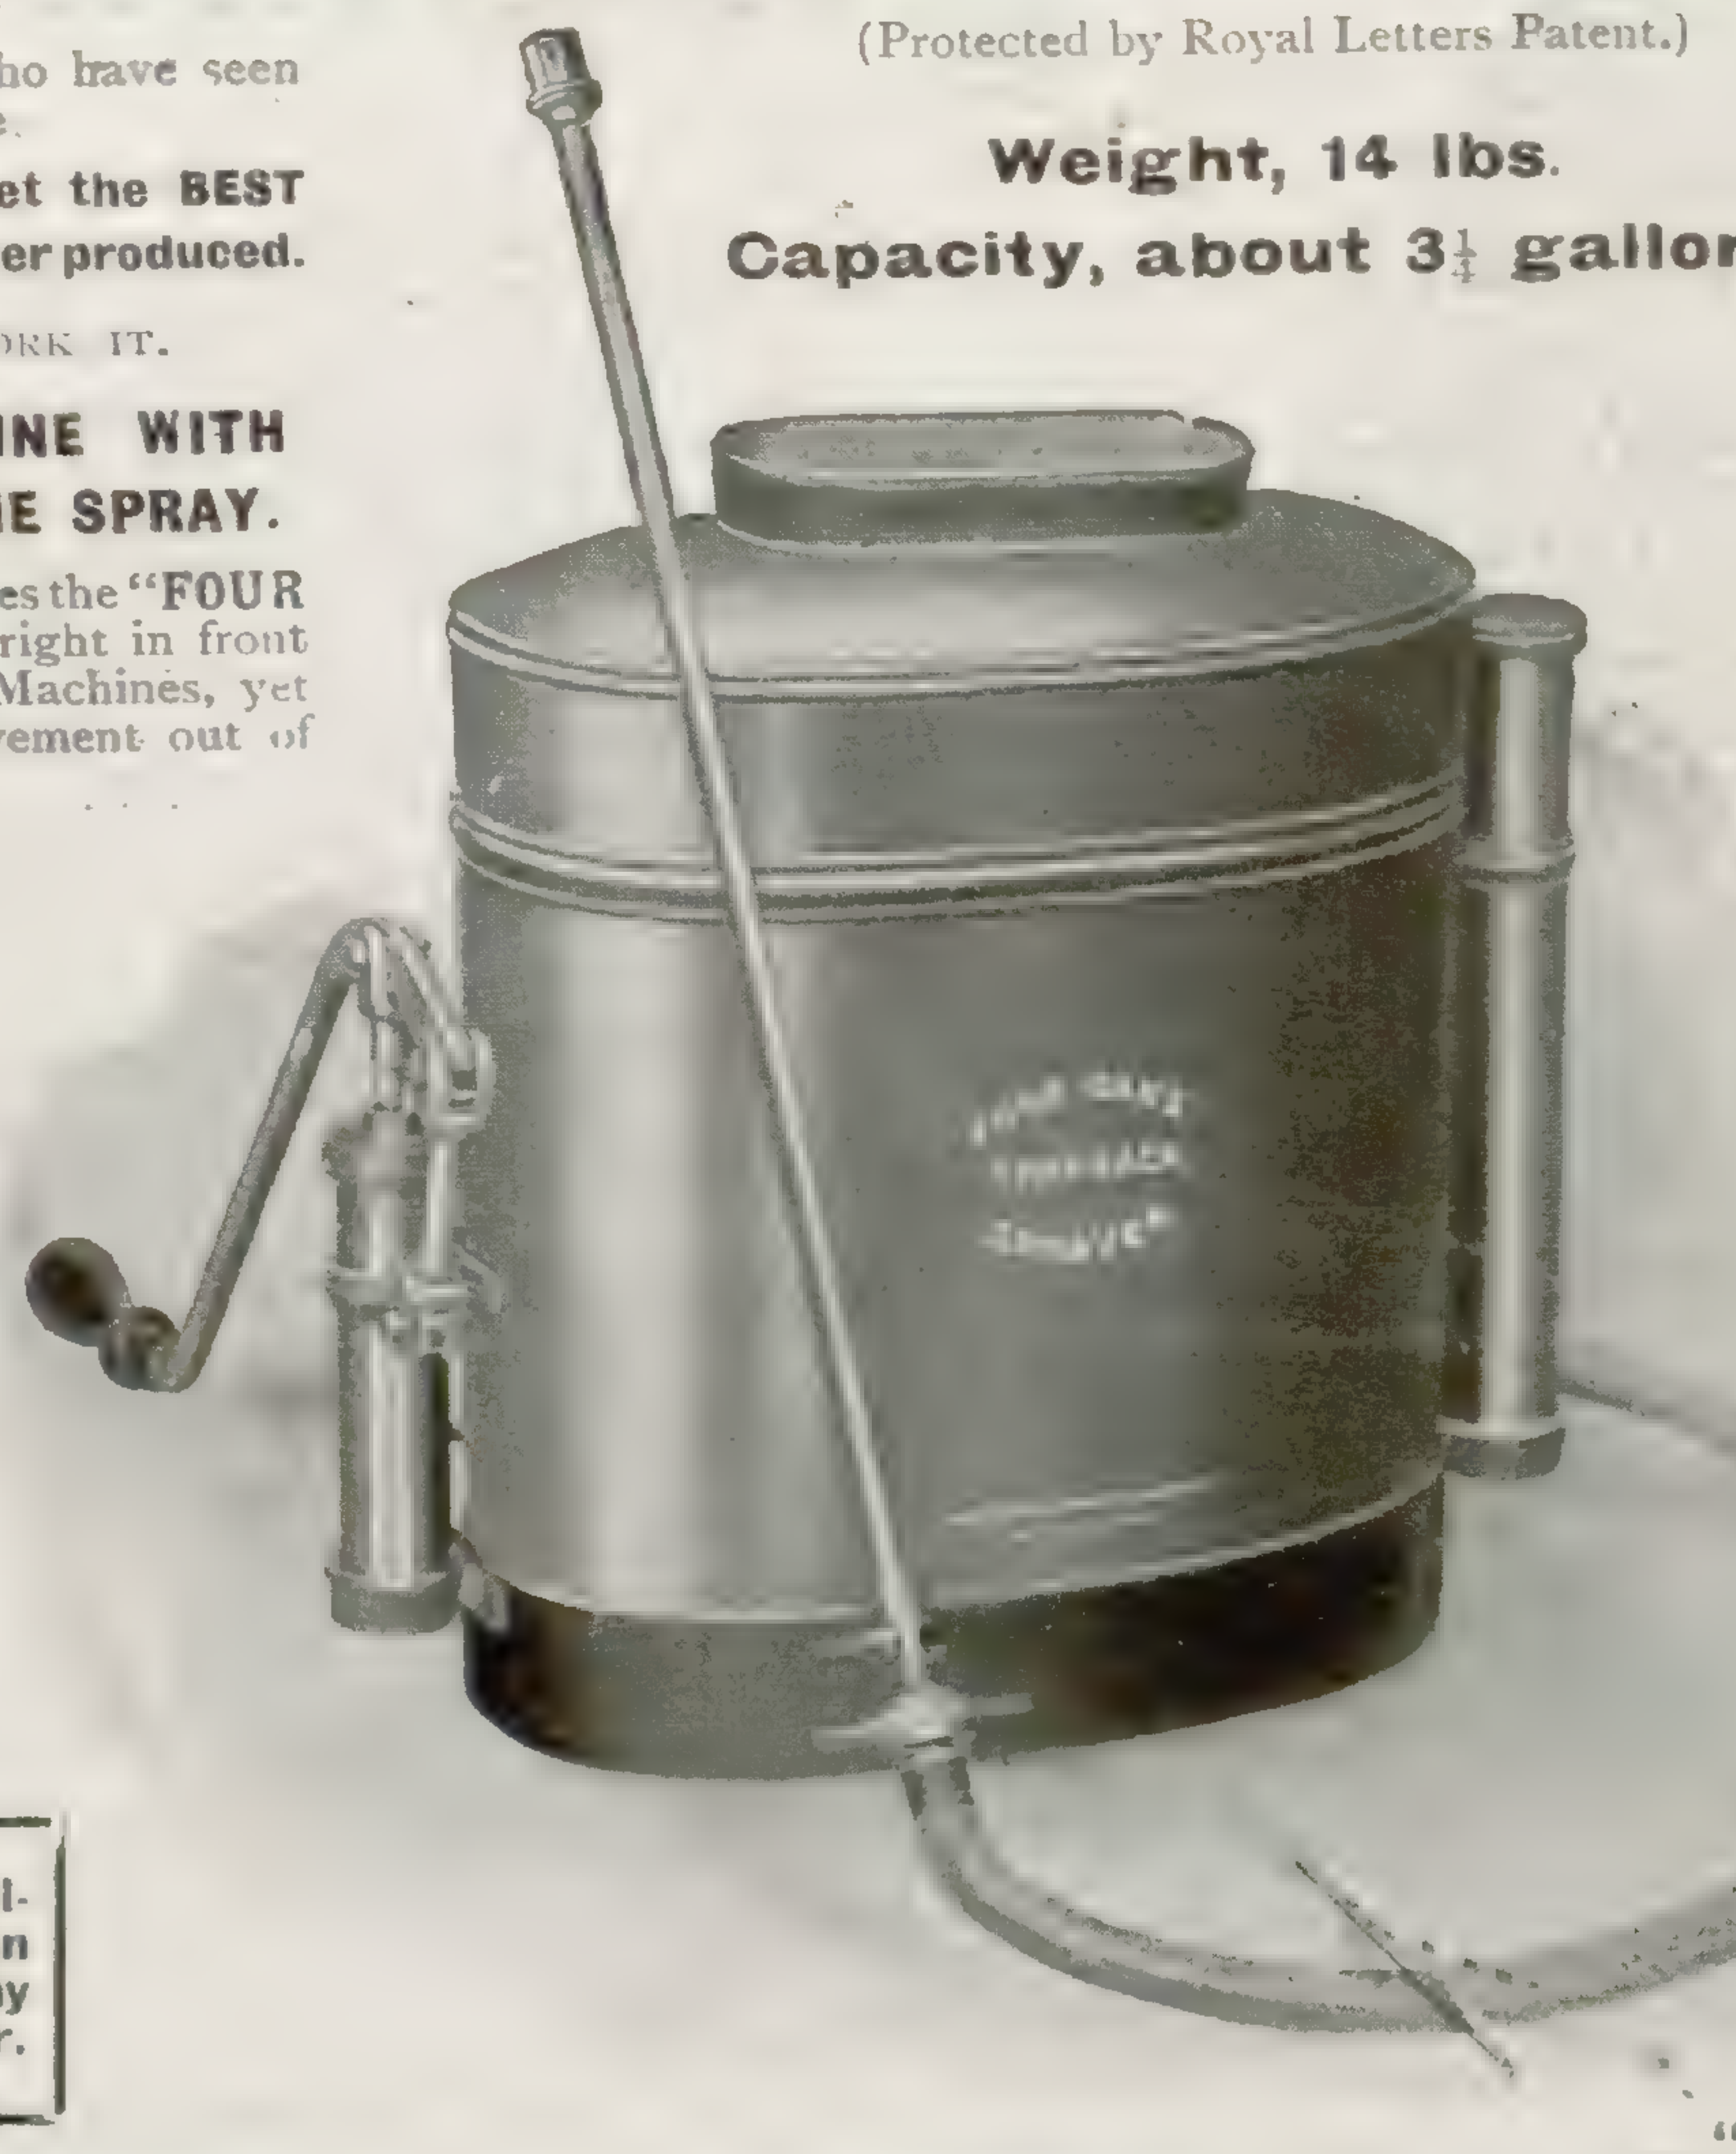
DURABILITY & SIMPLICITY THE GREAT FEATURE.

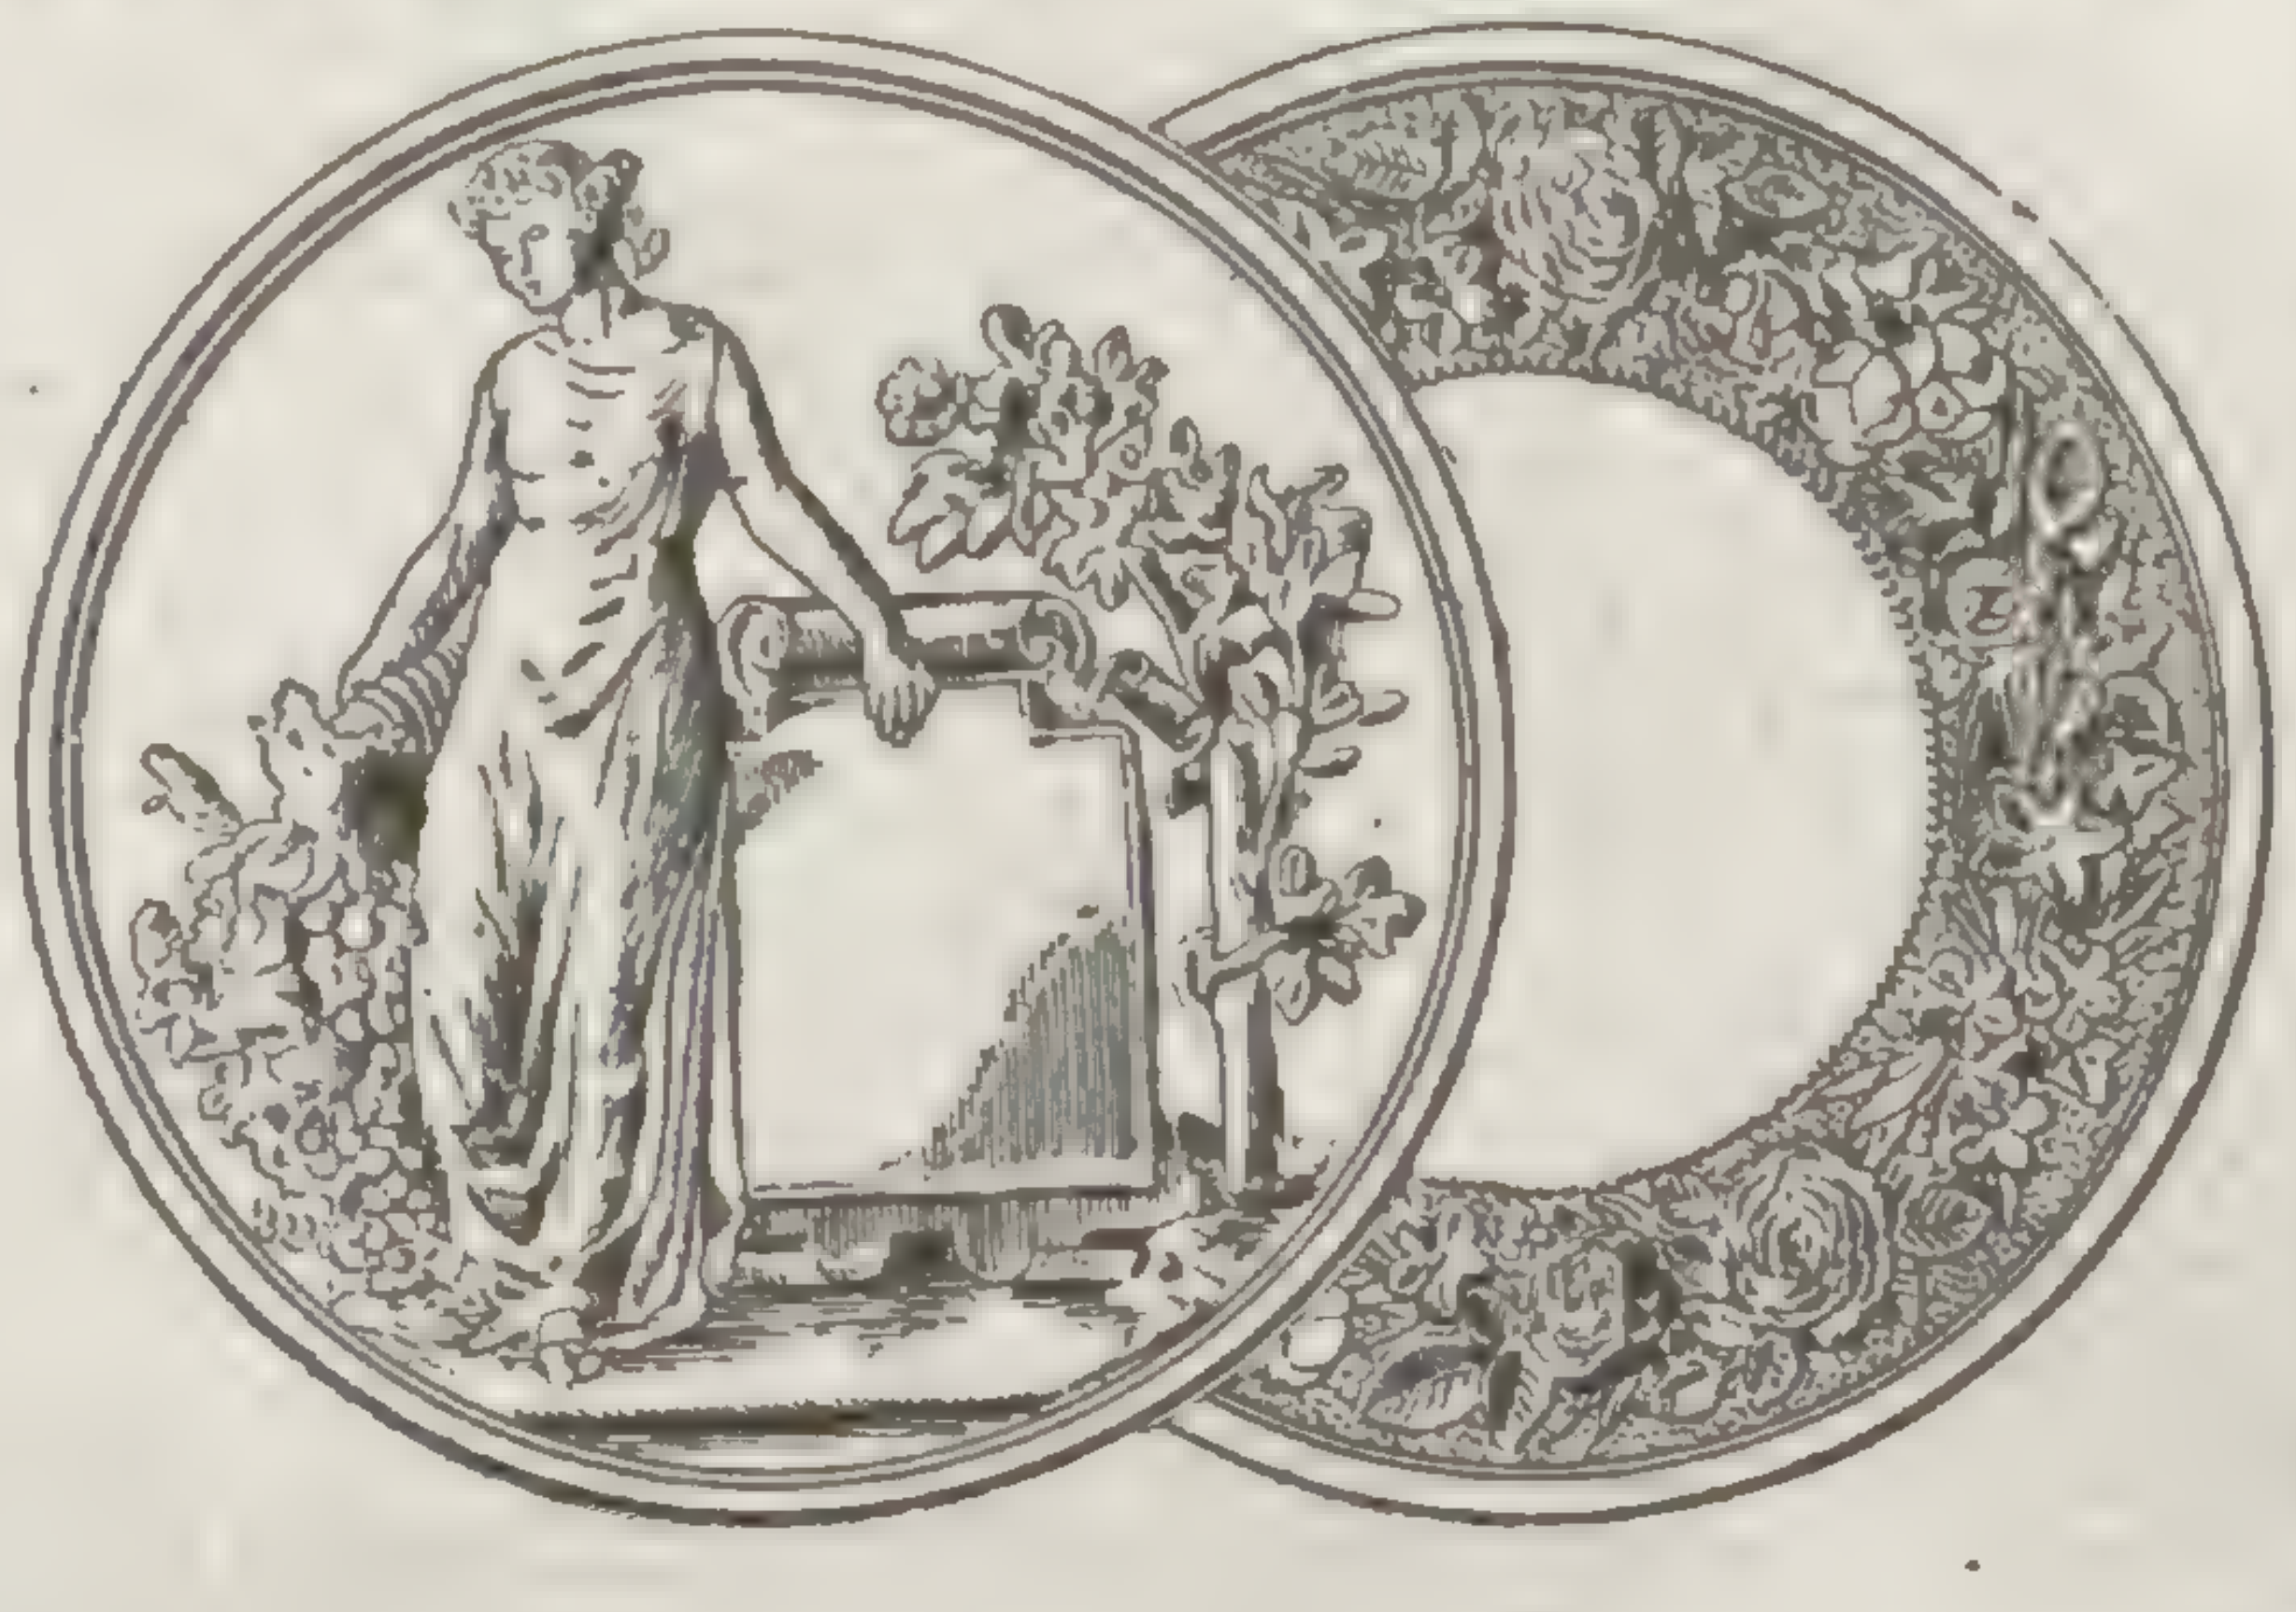
No Rubber Valves.

All Working Parts Outside.

Powerful Brass Pump giving great force behind Spray.

☞ **A Machine willingly sent on approval to any head Gardener.**





The "Four Oaks" Knapsack won **First Prize** (Silver Gilt Medal) at Wisbech Spraying Demonstration **AFTER EXHAUSTIVE TESTS** in competition with the world.

This Victory repeated at Bath and West Show, Rochester, 1910.

Also awarded **First Prize,** Silver Medal, by the Welsh National Agricultural Society, at Aberystwyth, 1909, for being Best New Implement in Show; **Silver Flora Medal,** Royal Horticultural Society, Holland Park Show, 1910; **Diploma** at Hayes Spraying Demonstration; **Certificate of Merit.** Altrincham; and dozens of others.

"THE KING OF KNAPSACKS."

PRICE, complete with Single "Four Oaks" Patent Spraying Nozzle, also Single Swivel Spraying Nozzle and Short Brass Tube, with Stopcock, together with 3 feet length of India-rubber Tube, as illustrated above ... ... **45/-** Net Cash. Carriage Forward

Double Swivel Nozzle can be supplied in lieu of Single Swivel at **2/-** extra.

The Swivel Nozzles are for Spraying in any direction, either in front, or to the right hand or left hand, or up or down as desired by user, who can change direction instantaneously.

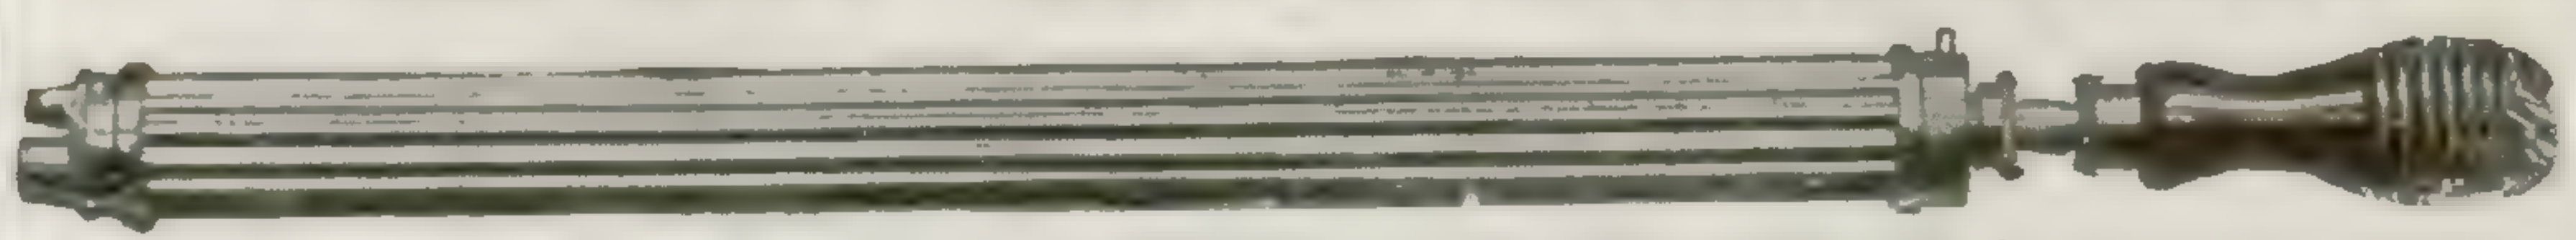
☞ **The "Four Oaks" Marvellous Nozzles give a finer Spray than any other ever made.** Price **3/6** extra.

Long Tubes for Spraying Tall Trees:

Patent "Four Oaks" Bamboo Lance, 10 ft. 6 in. long in one piece, with Interior Brass Tube, complete with Stopcock and all necessary Brass Fittings for spraying tall trees ... ... **17/6** extra.
6 ft. 6 in. ditto in 1 piece ... ... **12/6** ,,

The ordinary length of **India-Rubber Tubing,** as supplied with the machine, being too short for the management of the long lance by two men, ought to be replaced with an India-Rubber Tubing of 8 ft. in. length. Price, with union, **7/-** extra.

The "FOUR OAKS" Syringes ARE THE ONLY SYRINGES EVER AWARDED A GOLD MEDAL.



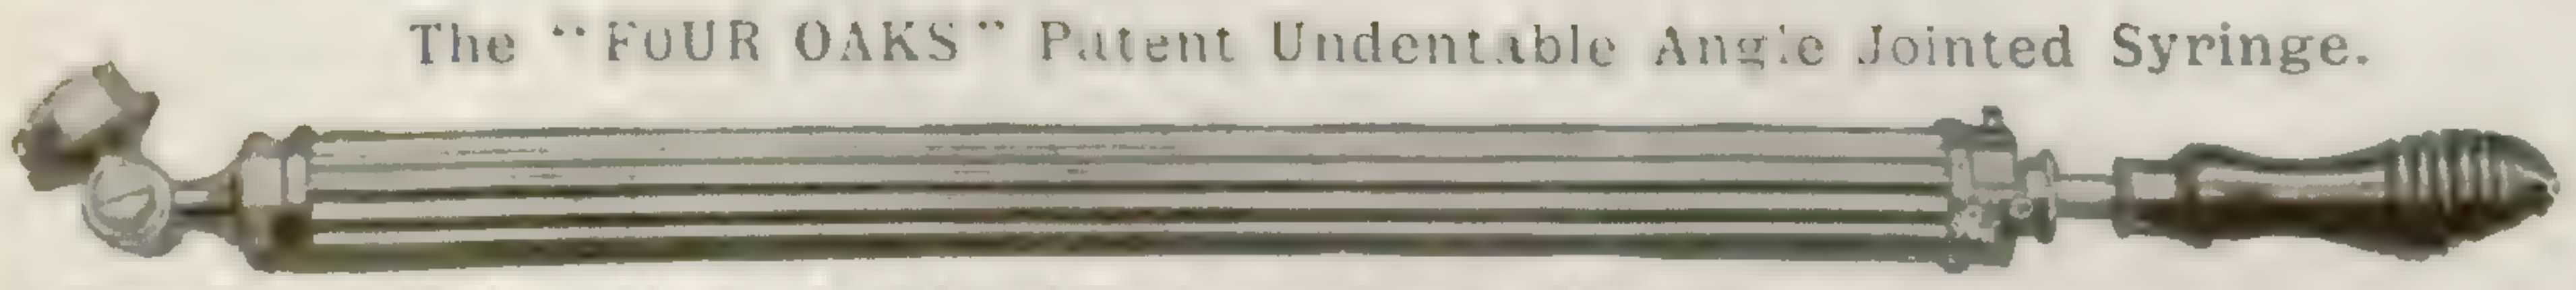
THE "FOUR OAKS" Patent Undentable Syringe.

"Four Oaks" Undentable Syringe, the Gardener's Ideal Syringe, complete with Jet as illustrated, also fine and coarse roses,

		Standard size.
No. 1.	Best quality, with teak handle Large size, 1¾ by 20 in., **25/-**	1½ by 20 in., **21/-**
No. 2.	Good quality, rosewood handle Large size, 1¾ by 18 in., **21/-**	1½ by 18 in., **17/6**

Standard sizes strongly recommended.

The "FOUR OAKS" Patent Undentable Angle Jointed Syringe.



"Four Oaks" Undentable Angle Jointed Syringe. Invaluable for syringing the undersides of leaves and branches which cannot be reached by the ordinary syringe. Is the Undentable Syringe illustrated above, with the addition of an Angle Joint.

		Standard size.	Large size.
No. 5.	Best quality, teak handle ...	1½ by 20 in., **27/-**	1¾ by 20 in., **32/-**
No. 6.	Good quality, rosewood handle	1½ by 18 in., **23/6**	1¾ by 18 in., **28/-**

Standard sizes strongly recommended.

The "FOUR OAKS" Patent Undentable Spraying Syringe.

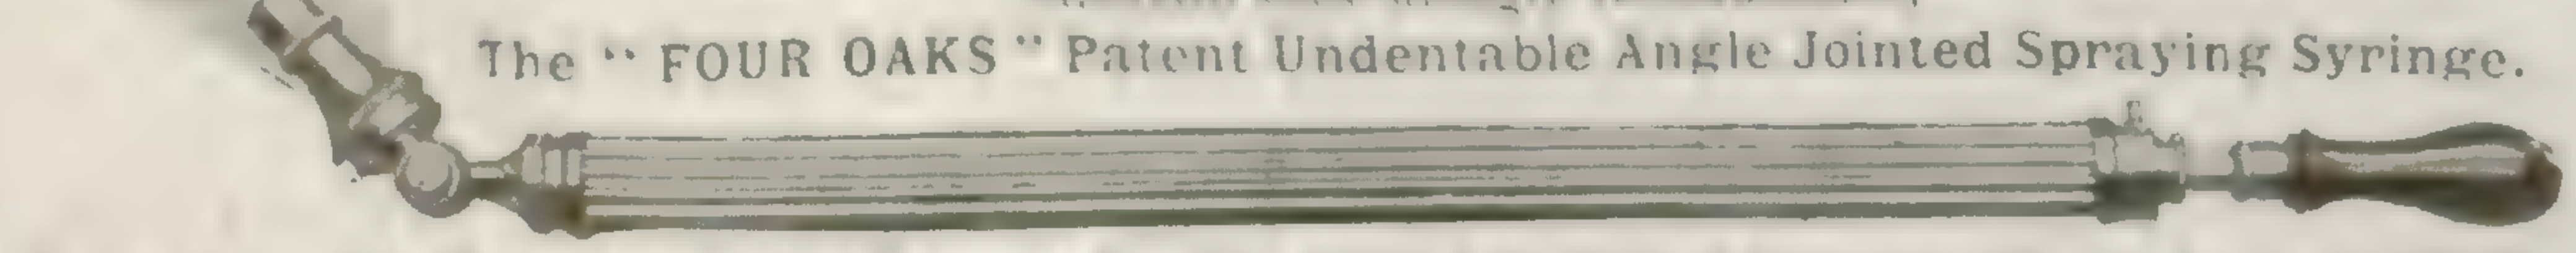
The "Four Oaks" Undentable Spraying Syringe. The most useful Syringe it is possible to have in a garden. Gives a fine vapour or mist like spray. Invaluable for ordinary spraying or for distributing Insecticides.

No. 9. 1⅛ in. by 20 in., **12/6** 1½ in. by 20 in., **16/6**

Is fitted with quick filling ball valve.

The 1½ in. by 20 in. size strongly recommended.

The "FOUR OAKS" Patent Undentable Angle Jointed Spraying Syringe.



The "Four Oaks" Gold Medal Undentable Angle Jointed Spraying Syringe. This is the same Syringe as No. 9 illustrated above, but with the addition of an Angle Joint for spraying the undersides of leaves and branches. An invaluable syringe.

No. 9 AJ. 1⅛ in. by 20 in., **18/-** 1½ in. by 20 in., **22/6** The 1½ in. by 20 in. size strongly recommended.

Sole Patentees and Manufacturers—

The "Four Oaks" Undentable Syringe and Spraying Machine Co.,

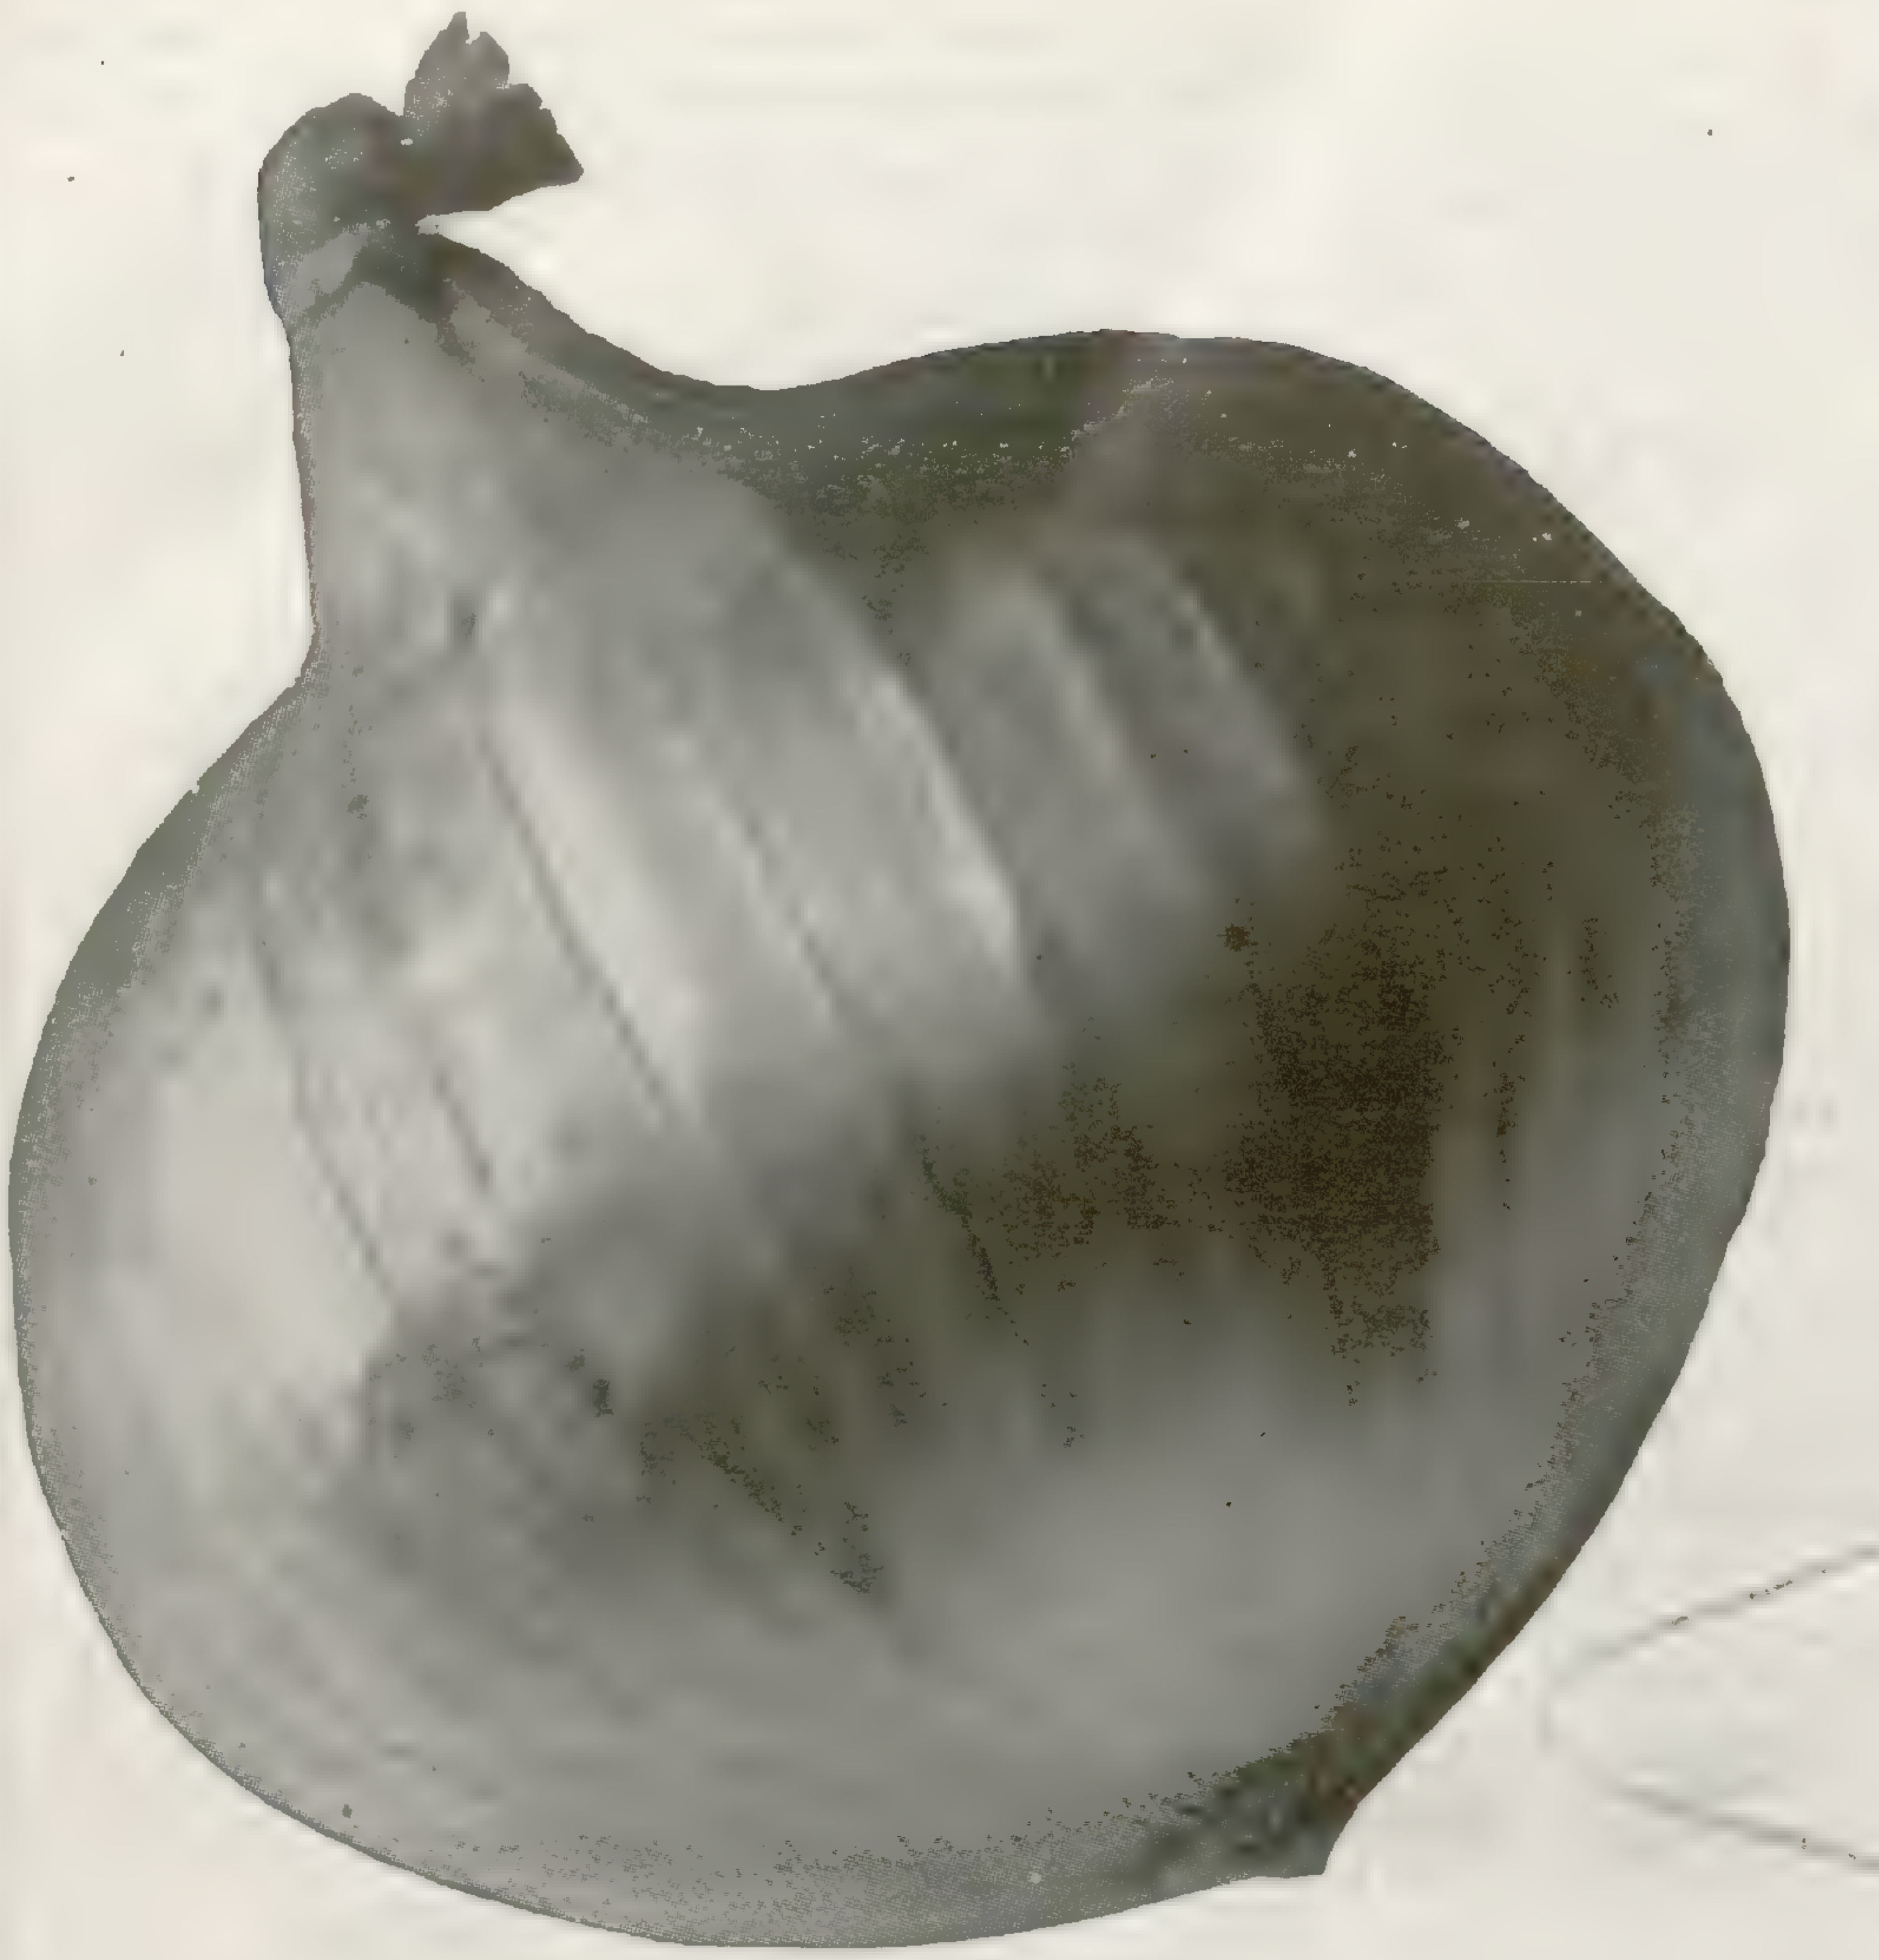
No. 5, SUTTON COLDFIELD, BIRMINGHAM, ENGLAND.

Special Spraying Nozzles for all purposes. **Send for Complete Catalogues—free on application.**

We Manufacture Spraying Machines and Pumps, Large and Small, of every type.

Can be ordered through your Seedsman, Nurseryman or Ironmonger, or will be sent direct if desired.

☞ **Latest Awards: Two Gold and Two Silver Medals, Hexham Fruit Congress, 1910.**



Premier

¶ "PREMIER" IS UNDOUBTEDLY a very fine type of onion. ¶ Your "Premier" Onion is by far the best I have grown for the past three years, both in shape and weight. ¶ Your "Premier" Onion is an excellent one. It attains a large size and keeps sound longer than any other variety grown here. ¶ I have been an onion grower for 20 years, and I must say "Premier" is the best I have come on yet. ¶ The bulbs are large and of fine globular shape, so much prized by exhibitors, which ensures its keeping qualities. These are a few of the unsolicited opinions of our customers. It is an excellent maincrop and exhibiting variety. Its general good qualities have made it exceptionally popular.

THE SEEDS TO GROW FOR OUR 1911 PRIZES. WE are giving £44 in Manchester (Sept. 13th); £22 in London (Aug. 30th); £24 at Shrewsbury (Aug. 23rd and 24th); and at many other Shows. See our new Seed Catalogue. It is free.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out, Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head Working, where two or more are kept); experienced in all branches; 12 years' excellent reference as Head, left own request; age 45; two in family, youngest 15. HUNT, 9a, Bridewell Street, Devizes, Wilts.

GARDENER (Head Working), requires SITUATION; experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants; Flower and Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 73, Allen Street, Maidstone, Kent.

GARDENER. (Head Working, where one or more are kept); life practical experience, Inside and Out; good references. J. BOLTON, Hadlow Down, near Uckfield, Sussex.

GARDENER (Head Working) requires SITUATION; experienced Vines, Peaches, Melons, Fruit, Flowers, Vegetables; 5 years' good character; married. C. N., Clarence Cottage, Broadbridge Heath, Horsham.

GARDENER (Head Working, where one or more are kept, or good Single-handed); experienced Inside and Out; good references; abstainer; married; age 29. W.S., Office of this Paper.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Single-handed or otherwise); good all round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful, active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

WORKING MANAGER or FOREMAN.—Advertiser seeks engagement in Market Nursery or otherwise for either of the above; Bulbs and Root Forcing, Ferns and Chrysanthemums a speciality, also Cut Flowers in quantities (both Inside and Out), and Bedding Stuff; good Wreath, Cross, etc., Hand; over 20 years' practical experience in the general routine; highest references; age 36 years. T. J. COOK, 97, Llanover Road, Wembley, N.W.

C. W. CATT, Esq., will be pleased to recommend his SECOND GARDENER to any lady or gentleman; a thoroughly trustworthy and energetic Man, as Head Working Gardener, where 3 or 4 are kept; his credentials are of the highest order. Full particulars on application. Outwoods Gardens, Duffield, Derby.

JOURNEYMAN (Inside and Out); 2½ years last place, in flower garden and pleasure ground; leaving through death; age 24. Apply Mr. J. ALDER, Starston, nr. Harleston, Norfolk.

MR. J. R. TOOLEY would be pleased to recommend B. COLEMAN, as JOURNEYMAN, Inside, Fruits, or Plants; age 22. Apply B. COLEMAN, c/o Mr. Spencer, Chapel Street, Wellesbourne, nr. Warwick.

UNDER GARDENER, YOUNG MAN, seeks SITUATION as above; age 26; good references; 11 years' experience; disengaged; married when suited. W. SAVAGE, Paulerspury, Towcester, Northants.

GARDENER (Under) seeks SITUATION, Inside and Out; 2 years' good character, and 3 previous; leaving through place changing hands; disengaged; age 22. A. WORSFOLD, Benenden, Cranbrook.

MAN (43) seeks SITUATION in Nursery (Outside or In); experience in chrysanthemums, tomatoes, roses, ornamental trees, shrubs; clerical work if required; 3 years' experience; good references. B. S., The Laurels, Rock Terrace, Durrington, Worthing.

HON. F. G. WOLSELEY (Principal of the School for Gardening, Glynde, Sussex) highly recommends Lady Under-gardener who has completed her two years' training. Apply to H. WEARING, Castle House, Cirencester.

GENTLEMAN recommends YOUNG MAN, age 22, as Second of four or five; Inside and Out; 7 years' experience; good reference. Apply T. ROGERS, Michelmersh, Romsey, Hants.

IMPROVER (Inside or Inside and Out). Young Man seeks employment in garden; age 19; 6 years good reference. L. TYLER, Great Dalby, Melton Mowbray.

NEW CHRYSANTHEMUMS.

It gives us much pleasure to announce that we have secured several of the finest seedling Chrysanthemums of the year. Each raiser considers these the best of their productions, and when we remember that Master David, Master James, Sir Frank Crisp, George Hemming, Mrs. F. C. Stoop, Mrs. R. Brown, Miss Lillian Hall, etc., were raised by these gentlemen, no further comment is necessary.

Raised by Mr. T. STEVENSON.—Ernest G. Mocatta, yellow sport from Edith Jamieson.

varieties raised by Mr. H. PERKINS.—Harry Wood, 1911, J. H. Cocken, Lady Francis Ryder, Margaret Smith, Mrs. G. W. Ridgewell.

Varieties raised by Mr. G. MILEHAM.—A. G. Rodwell, G. F. Richardson, John B. Meakins, Miss Nellie Brockman, H. W. Meadows, Thos. Figg, R. C. Pulling, 1911.

Varieties raised by Mr G. CARPENTER.—Miss Elspeth King Clarke, Miss Nellie Hoar.

Varieties raised by Mr. A. H. HALL.—Incurved varieties: Master Albert Hall, Master Chas. Hall.

In addition good Novelties in Decorative Japanese varieties, Early Garden Japanse varieties, and Early Garden Single varieties.

Full descriptive Catalogue will be ready shortly, free on application.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The New Year.

MR. T. WILKINSON.

In referring to the possibilities of the year on which we have entered in its relations to horticultural activities, we would first express our high appreciation of the generous support we received during the past year from business friends, readers, and contributors, and assure them that we hope the present year may be both pleasant and prosperous. While we do not venture to indulge in prophecy as to what the year has in store for those who are engaged in gardening or in the various activities associated therewith, we are impressed with the conviction that there is full justification for anticipating the future with a spirit of hopefulness. There can be no doubt that the Coronation of the King and Queen in June next will have a highly beneficial influence upon horticultural enterprise, and especially upon that section of commercial horticulture devoted to the production of supplies of plants, flowers, and fruit for market purposes. This great function, and the festivities associated therewith will, it may be safely assumed, give rise to a largely-increased demand for the choicer products of the garden, and the endeavour to meet increased requirements will not only necessitate greater activity on the part of the market growers and nursery firms generally, but in large numbers of private gardens. This increased effort will, let us hope, have the effect of bringing somewhat larger returns to those engaged in commercial horticulture, and prove advantageous to those who are in charge of private gardens by the greater interest that will be aroused in the garden and its productive capacities. In some cases the resources of the garden may be heavily taxed, but with our knowledge of the gardeners of this country we feel that there need be no apprehension as to their being otherwise than fully equal to the most exacting demands that may be made upon them. The stimulus that will be given to the affairs of the garden by the Coronation and its festivities will be supplemented by activities in other directions. The Council of the Royal Horticultural Society have, as usual, arranged a comprehensive and otherwise excellent programme for the year, and in one direction a distinct new departure will be made. This year the summer exhibition will be held at Olympia, instead of in the grounds of Holland House, which are no longer available for the purpose, and it will be a matter of considerable interest to see whether it will prove financially successful. Many Fellows and others who fully appreciate the charm of flower shows held under canvas in beautiful grounds, will probably regret the change. But it must be remembered that the great building at Addison Road is conveniently situated near a railway station in connection with all parts of London and its suburbs, and has so large an area as to afford ample space for an immense display of the products of the gardens and for many thousands of visitors. Moreover, the building is so well lighted as to admit of the exhibition remaining open during the evening, and, taking advantage of this, the Council have arranged to keep it open until ten o'clock on the evening of the first and second days at a low fee, and thus afford an opportunity to those who are unable to leave their ordinary avocation during the day to participate in the pleasure an exhibition of the first class is so well able to give. The Temple Show will have additional interest from the fact that, in view of the great International Horticultural Exhibition at Chelsea in May, 1912, the Royal Horticultural Society will not hold an exhibition in the gardens of the Inner Temple next year. The mention of the International Horticultural Exhibition of 1912 reminds us of the necessity of urging upon all who are jealous of the prestige of British horticulture and have the means, the importance of their showing their practical sympathy with the arduous labours of the Executive Committee by at once contributing liberally to the funds that will be necessary to carry out the exhibition and the various functions associated therewith. It is not less necessary that the local committees which have been formed or are in process of formation should bestir themselves, because on their efforts will the financial support materially depend. A large sum will be required to provide the prizes in the four or five hundred classes that have a place in the provisional schedule, the exhibition houses, the bands, to entertain the foreign guests in a manner befitting so important an occasion, and to meet the multitudinous other expenses, and every penny of this should be in the hands of the treasurer by the end of this year. The sum required, although large, is well within the compass of the great flower-loving community of this country, and if there is united effort an amount fully equal to the requirements, if not in excess of them, will be readily forthcoming. It is well known from the announcements we have made that the National Rose Society will hold three exhibitions during the year, but it may be that the activities of the society will not be limited to these, for the members of the Council possess abundant fertility of resource, and are quick to make such variations in its work as are likely to quicken the interest in the society and increase its usefulness. The trials carried out by the National Chrysanthemum Society during last year were so successful as to justify the anticipation that other trials will be included in this year's programme, and, assuming this will be done, we would suggest as worthy of the consideration of the committee the question of organising visits to nurseries and gardens in which the trials are being conducted, and also to trade and private establishments wherein chrysanthemums form an important feature. Such visits should be not less pleasurable, and certainly more useful than the excursion annually made. Possibly the National Rose Society might with advantage arrange for one or two visits to famous rose gardens and rose nurseries in the course of the season of roses. Another event of considerable importance in what promises to be an eventful year is the commencement of the work of the National Hardy Plant Society, which was formed last year. There is abundant scope for such society, and there are cultivators innumerable of hardy plants, and if the latter will give the support to the society it should receive from them it will at once be placed in a position to exercise an important influence for good upon hardy plants and their cultivation.

Mr. T. Wilkinson, who has had charge of the Tyntesfield gardens, Flax Bourton, during the past nine years, illustrates in a marked manner the great advantage of a varied and thorough training early in life, and especially in the case of those who are fortunate in possession of natural abilities of a high order. The gardens of Tyntesfield are properly regarded as of exceptional interest for their high keeping, and Mr. Wilkinson occupies a foremost position among the practical horticulturists in the district of which Bristol is the centre. A native of Midlothian, Mr. Wilkinson commenced his gardening career at Pennycuick House, the seat of the late Sir George Clerk, Bart., under a Scotch gardener of the old-fashioned type, but a man of ability. After a stay of four years he went to Mavisbank, where heaths and hard-wooded plants formed a great feature: thence he moved to Blythswood, and subsequently to Castlemilk, Lanarkshire, where great improvements were being effected. Here Mr. Wilkinson was made indoor foreman, and after two years' service he came to London for a similar period, and obtained a good insight into gardening in the Metropolis. Mr. Wilkinson's first position as head gardener was at Weymouth with the Rev. Talbot Greaves. Here he remained until twelve years later, when the place was sold. Thence he went to Cedars Wells, Somerset, the residence of C. C. Tudway, Esq., and, encouraged by his employer, he commenced the exhibition of fruits and chrysanthemums, and achieved much success. Resuming the position of head gardener to Mr. Greaves, Mr. Wilkinson spent some years with him at Torquay and Bristol, and achieved much success at the former as an exhibitor of chrysanthemums, and at the latter in showing fruit, and especially grapes. Subsequently he was appointed head gardener to Anthony Gibbs, Esq., father of the present owner of Tyntesfield, who was keenly interested in his gardens, and ever ready to effect whatever improvements were desirable. During the five years that elapsed previous to his death the gardening staff was kept busily engaged with rearranging and planting, and Mr. Wilkinson acknowledges with gratitude the valuable assistance he received from the Hon. Vicary Gibbs. The grape vines at Tyntesfield were not in accordance with Mr. Wilkinson's ideas when he assumed charge, and his first endeavour was to lift them all, and as the vineries are one hundred and eight feet long, lofty, and of a proportionate width, this was a big undertaking. The results have fully justified the endeavour, for the crops are such as to give Mr. Wilkinson a high position as a grape grower.

"Gardeners' Magazine" Almanack.—With this issue we have the pleasure of presenting our readers with a double-page almanack for the current year, which is equally remarkable for its attractiveness and utility. In the calendar for the twelve months will be found entries of all the important exhibitions and meetings that will be held in London and the provinces during the year, and the almanack has much value for purposes of reference. The beautiful rose Juliet, the subject of the illustration in colours, is one of the most noteworthy introductions of recent years, and has the promise of attaining to a high degree of popularity. This fine hybrid briar, as our readers have been already informed, was raised by Messrs. William Paul & Son, Waltham Cross, Lim., in their nurseries, and has received the exceptional distinction of a First Class Certificate from the Royal Horticultural Society. When the firm first exhibited blooms at the Horticultural Hall, in the summer of 1909, the R.H.S. Floral Committee unanimously conferred an Award of Merit upon the variety, and last year, when exhibited at the Holland House Show, the same committee was so impressed with its distinctness and beauty that the award of a First Class Certificate was made. Juliet has the merit of blooming during the summer and autumn, and the flowers are delightfully fragrant.

List of Orchids Used in Hybridisation.—With a generosity and thoughtfulness that was very highly appreciated by the R.H.S. Orchid Committee, Mr. J. Gurney Fowler, the chairman, presented each member on January 3, with a "List of Orchids Used in the Fertilisation of Hybrids which have received either First Class Certificates or Awards of Merit from the Royal Horticultural Society." The list is brought down to December 31, 1909, and is a work of fifty-one pages, interleaved with ruled paper to receive additions. Mr. Gurney Fowler has produced this extremely useful publication at his own cost, and it is for private circulation only. The arrangement is very simple, three columns to a page; for instance, under Cattleya, the first entry reads: "Acklandiæ—C. Forbesi C. quinquecolor," which means that Cattleya Acklandiæ crossed with Cattleya Forbesi has produced a hybrid named C. quinquecolor. This system is followed all through, and where one parent is itself a hybrid, the parentage is given in brackets just below its name. Needless to say the members accorded their chairman a very hearty vote of thanks. Mr. Fowler also proposes to bring the list right up to date immediately in a supplement that can be cut up and pasted into the list proper.

North of England Horticultural Society.—On Friday afternoon of this week the inaugural meeting of the North of England Horticultural Society is being held at the Town Hall, Leeds, with J. Hastings Duncan, Esq., M.P., in the chair. For some time past it has been felt by Northern horticulturists that the excellent work that is being done by the Royal Horticultural Society could not be participated in by horticulturists in the North to the extent that could be desired, owing to the great distance from London, and the consequent difficulty of attending the fortnightly meetings. It was therefore decided in October last to form a horticultural society, in affiliation with the Royal Horticultural Society, with headquarters at Leeds. A provisional committee was formed to prepare the necessary rules and regulations. The society will be under the management of a council, and there will be a Floral Committee, a Fruit and Vegetable Committee, and a Scientific Committee. The idea is to promote and encourage every branch of horticulture in the North of England by means of periodical meetings and exhibitions. It is intended that the work should be of a distinctly educational character, and that it shall not devote its efforts exclusively to the holding of exhibitions. The object of the meeting that is being held on Friday is to confirm what has been done by the Provisional Committee. The society has been fortunate in securing as secretary the Rev. J. Bernard Hall, of Dalston, Cumberland, who, as hon. secretary of the Northern Counties Fruit Congress, held at Hexham in October last, gave practical proof of his remarkable ability in the organisation of horticultural bodies.

Black Currant Mite.—With reference to an article which recently appeared in these pages, on the difficulties with which fruit growers have to contend, Messrs. J. R. Pearson and Sons, Lowdham, Notts, write: "Surely Mr. Hammond's pessimistic observations on the black currant mite are rather out of date. We have conclusively proved that the mite is as easily dealt with as aphis, if only taken in hand at the proper time. The bushes should be sprayed with the old-fashioned quassia and soft soap mixture at the end of March, twice in April, and again early in May. We have heard good reports from growers who have tried Professor Collinge's recommendation of dusting with unslaked lime and sulphur, but, the spraying having been found absolutely efficacious, and more cleanly and easily applied, we have recommended its general adoption. This information is not new, having been published several times, and in our catalogue for the last six years, but Mr. Hammond's remarks seems to show a need for its repetition."

"The Botanical Magazine."—The plants figured and described in the current issue of this publication are: Dendrobium Dartoisianum, a handsome species, discovered in Indo-China five years since, and introduced to cultivation by Mr. G. Brouckart; the flowers are yellow, with purple tips to the petals and sepals. Cladothamnus pyrolæflorus, a neat-growing shrub producing small red and yellow flowers; it is a native of Alaska, and thrives under the same conditions as Rhododendron hirsutum. Aquilegia flabellata nivea, a white-flowered form of this Japanese species, possessing much beauty. Aster Falconeri, a handsome species, which has its home on the mountains that surround the Valley of Kashmir. This species was introduced to cultivation by Messrs. Barr and Sons, and the illustration in the "Botanical Magazine" has been prepared from material supplied by Mr. William Marshall, V.M.H. Phædranassa Carmioli, an interesting species, with bright red and yellow flowers, and thriving in an intermediate house.

A Small Holding in the United States.—Mr. Martin Arnold, a Swiss, farms 20 acres in Nebraska, and has been so successful in cultivating land that was almost barren to begin with, that the Department of Agriculture has published a bulletin giving his methods and achievements. It is said that Mr. Martin makes 2,000 dollars, or about £400 a year from his holding, and yet, so poor was the land that he only paid £250 for it a few years ago.

WICHURAIANA ROSES AS STANDARDS.

Until the advent of Rosa Wichuraiana and its many hybrids roses in standard form had fallen out of favour in many gardens, but at present we have few more charming features than well-grown specimens of this comparatively new class, or section. Being so hardy, and free in growth, they are just right for standards, a form of culture that needs vigour and hardiness in the varieties used, for without these characteristics they fail to draw sufficient sap through the briar stem to keep the whole head in a healthy and thriving condition. At present the Wichuraiana hybrids are much grown upon stems of extra height, and their naturally drooping habit thus shows off to great advantage, producing perfect cascades of blossom. Nor are there any roses more certain of blooming than these, and now that we are securing a perpetual-flowering strain they promise to be increasingly useful

[Photo: F. Mason Good.

STANDARD SPECIMENS OF DOROTHY PERKINS

In the gardens of Hartley Grange, Winchester, the residence of F. Walkinshaw, Esq.

As standards in pots they have, during the last few years, been in general use at the exhibitions, while few subjects are more suitable for the conservatory, the erect stems carrying the head high enough to show it off to advantage. Upon the lawn or by carriage drives they make a noble feature early in the season, and if not so perpetual as some other roses, they produce an immense crop of flowers on their long stems. Another advantage is the extreme cleanness of foliage and the absence of mildew and red rust. Frequently, too, there is a fairly good display of bloom in the autumn. Then, again, we have such a grand range of colours, and with the numbers of hybrids coming upon the market the hues are certain to be increased.

Dorothy Perkins, illustrated herewith, is one of the very best, and most reliable, and so, too, is the white sport from this. Dorothy Perkins has also sported in blush and other forms, such as Lady Godiva, Christian Curle, and, I believe, Dorothy Dennison. I find, however, that these sports have a decided tendency to revert, even the same truss sometimes showing more than one distinct form. A new hybrid, Aviateur Bleriot, promises to be one of our finest yellow climbers, with a more constant yellow shading than is found in William Allen Richardson. It is an excellent grower, and freer in blooming than many. Shower of Gold is another new yellow, but this does not bloom in such large trusses as most. One of the sweetest scented roses is Gardenia, another golden-yellow, when quite young, but lighter as it expands. The foliage of this variety is very handsome. Minnehaha I prefer to Dorothy Perkins in some respects. It lasts longer, and has fine pyramidal-shaped trusses of large size.

One of the brightest of all is Excelsa: almost a deep scarlet, double, lasting well, and with very thick, glossy foliage. Réné André is a great favourite with me, as it continues in bloom a long time, has beautiful blendings of copper, orange, peach, and rosy-pink, while its delicate perfume rivals that of L'Ideal, which was one of its parents. It is also one of the earliest to flower. Ernest Grandpierre is another of extra fragrance, but a late bloomer, with clear yellow buds and almost white flowers. A yellow that opens early, and is also one of the best autumn bloomers is Francois Foucard. Coquina is a single, pale pink tipped with rose, and very pleasant. Perhaps one of the most popular is Hiawatha, a deep crimson, with an almost white centre, and very showy golden anthers. This variety, and Delight, which favour one another, except that the latter is a clear carmine, are both rather late flowering, and continue bright much longer than the rest. Elisa Robichon is a small, perfectly shaped flower of salmon-buff, with a yellow base; this, and Evergreen Gem, have very slender, graceful growth, that droops rather more than most. The last is an early bloomer.

Jersey Beauty is also an early pale yellow, fairly large, but single, and with very showy stamens. Being so hardy, it might well be used in place of the Macartney rose in exposed positions. Another good single is Joseph Billiard, a bright crimson, tinted with yellow, beautiful with its long buds, and very effective when fully open. Leontaine Gervais is peculiar, with its deep nasturtium-red flowers, intermingled with carmine and salmon. I find a new variety in Madame Alice Garnier, quite perpetual. This is pervaded with the orange-copper found in Ophrie. It is small, very double, and has good-sized trusses. After White Dorothy Perkins, Schneeball is a good snow white, the blooms neat, and borne in trusses. My favourite white, however, is the old type or species, from which this valuable section originated. It blooms about the middle of July, and continues until after the first frosts. The flowers are single, with yellow stamens that go quite black with age; it flowers in trusses, and has long trailing growths of handsome shining green foliage, and is as nearly evergreen as any rose we have. But this list does not contain half of the excellent varieties available, though my space will allow of no more being mentioned.

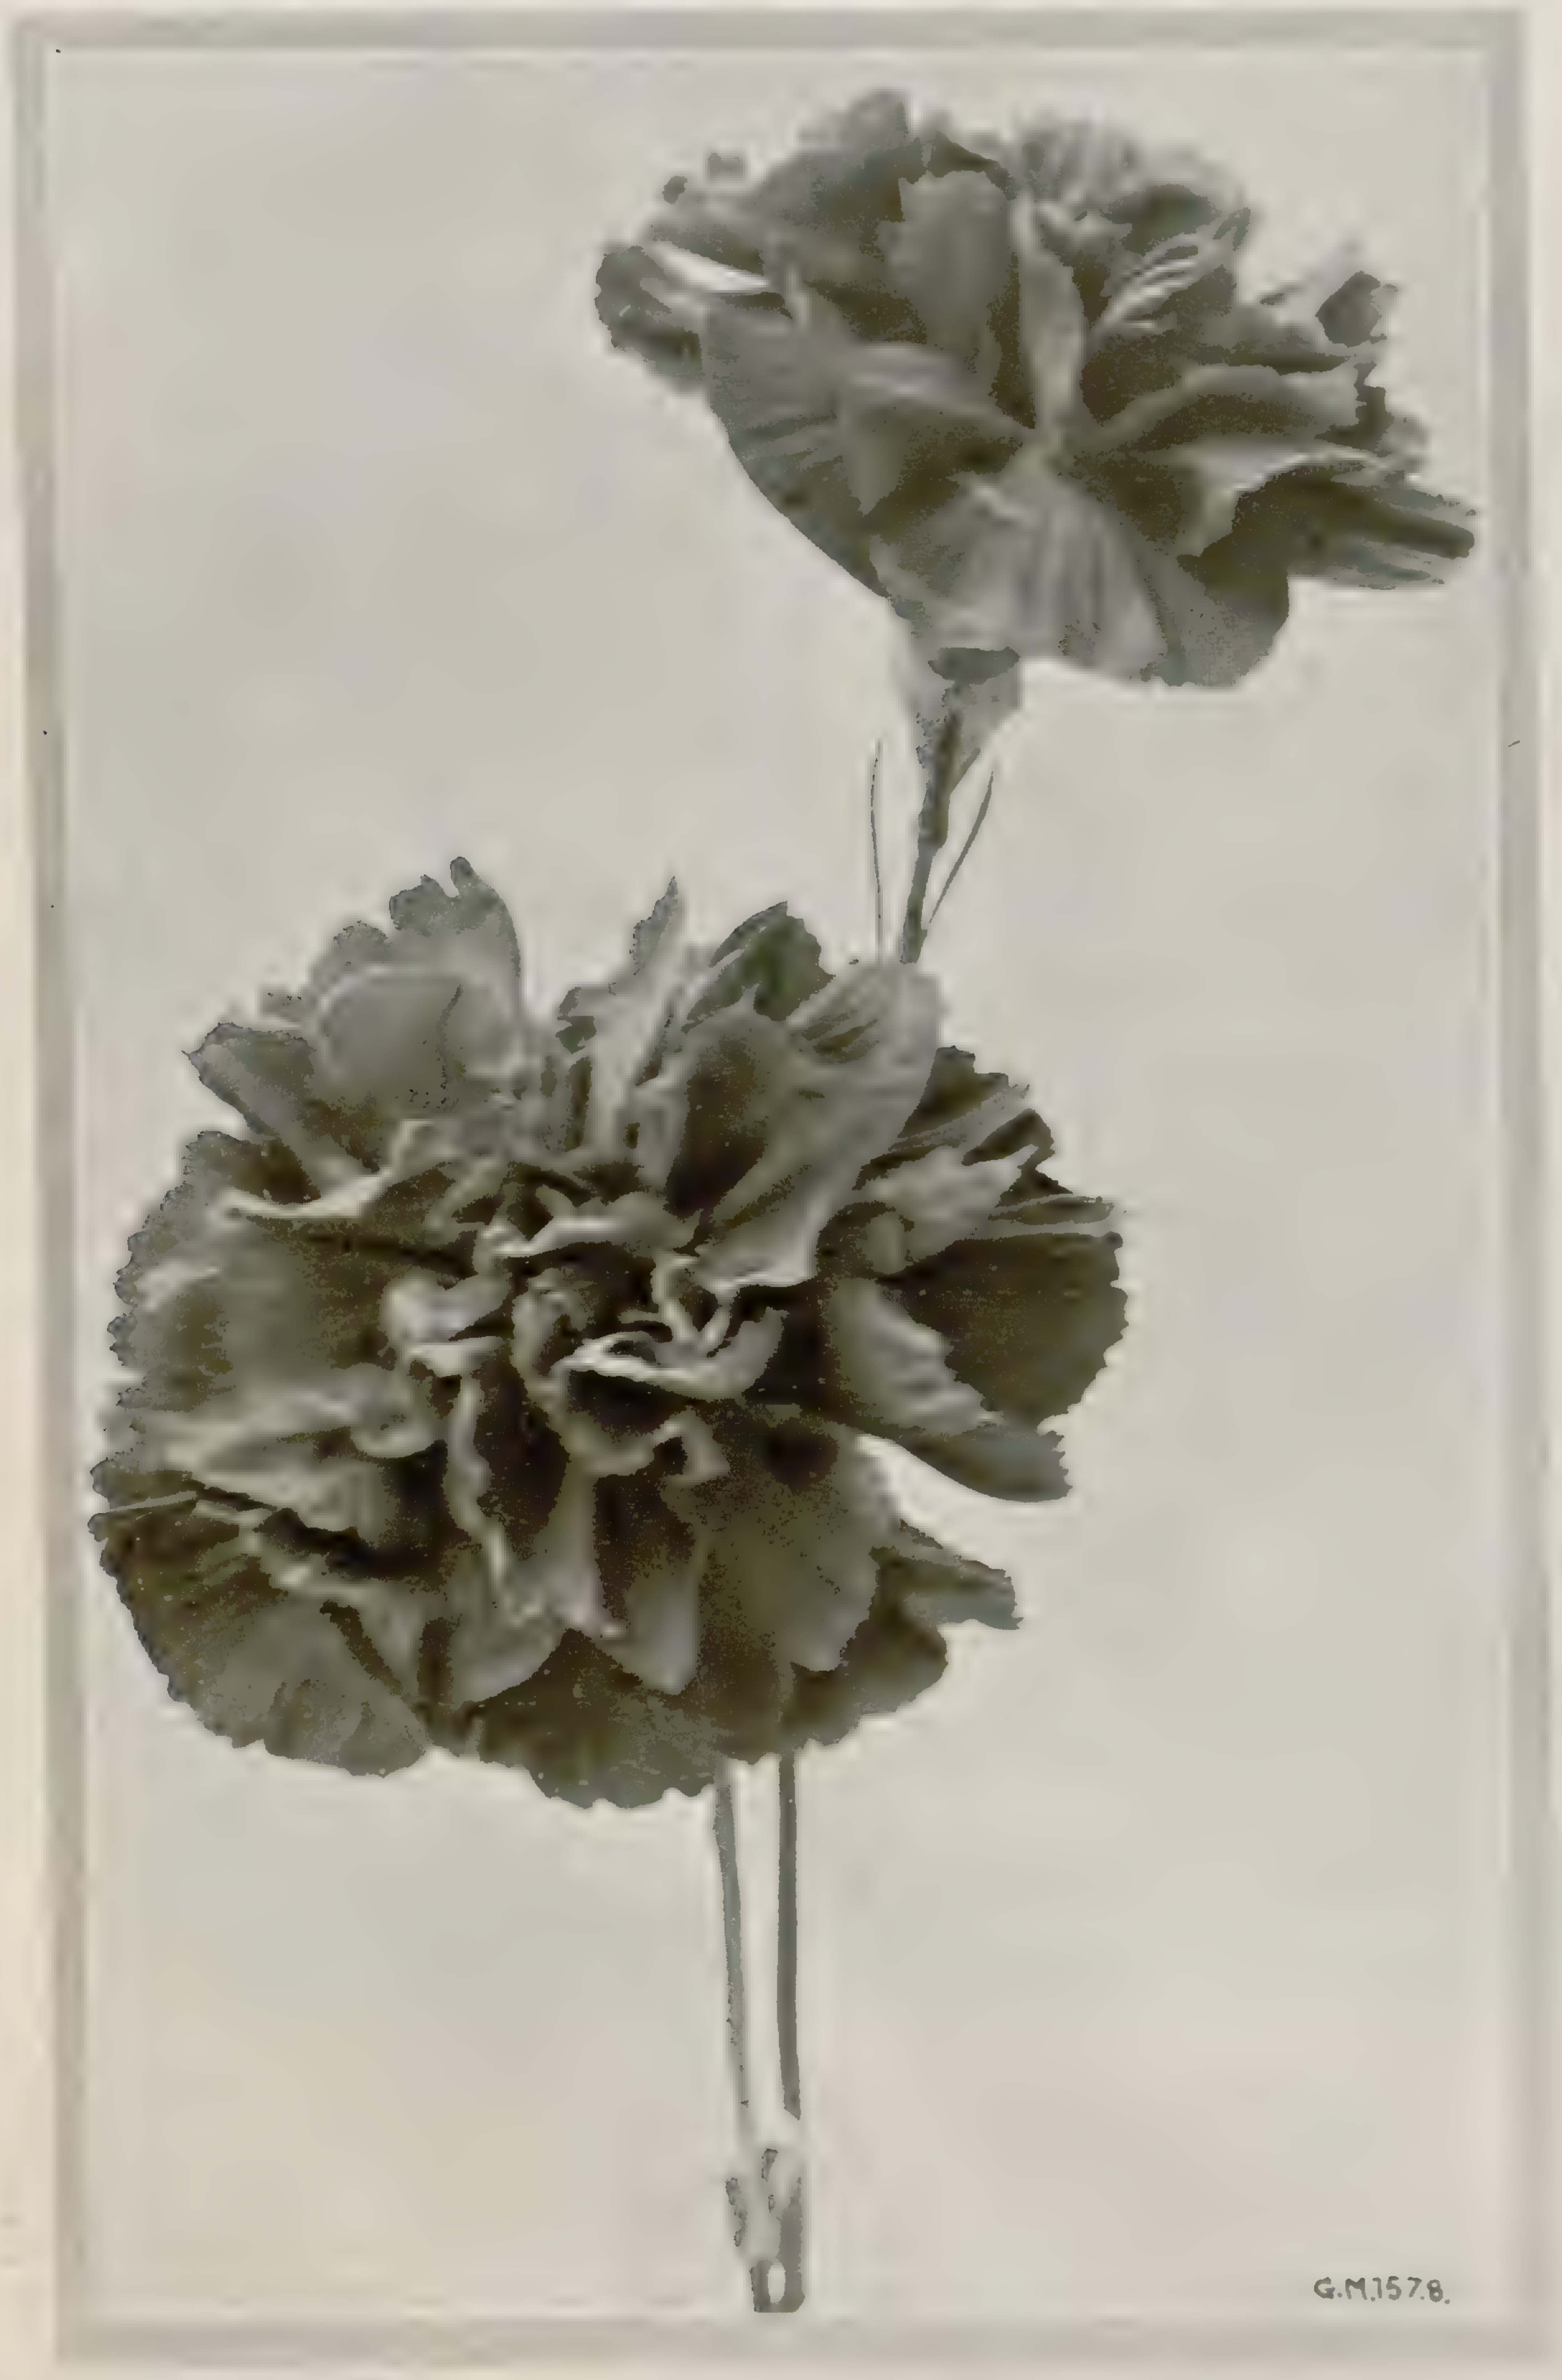
When growing these roses as standards it is advisable to prune hard the first year after planting in order to have matured and sound growth upon established roots. Afterwards they simply need to have the flowering shoots trimmed out and younger wood encouraged.

I have seen these roses upon eight feet to nine feet stems (and even higher), when they drooped over and spread so widely as to form a little arbour, after the fashion of the weeping ash and willows. There is more than one contrivance on the market now to keep the growths in umbrella-like form, and spread them out effectively, even so much as to allow of a small seat beneath.

A. Piper.

THE BEST SCARLET PERPETUAL CARNATION.

In every flower certain colours are much harder to obtain in perfectly clear shade and tone than others; hereditary traits make it so. In perpetual carnations the rule is, after yellow, red. All of us have had red and scarlet seedling carnations, and watched them reveal some short-comings. Four years ago I sowed some three thousand perpetual carnation seeds, all from what we termed "red blood," that is, red being the predominating colour of their ancestors. From this large number I selected some twenty scarlet seedlings for further test, some of them most glorious in form and colour, but to-day we have not a single member of that scarlet army left. All have been discarded, owing to some defect or the other. Old Flamingo was the parent of many, and certainly it did produce some very fine offspring; Adonis was another, and also Elizabeth, a seedling from Winter Cheer.



NEW PERPETUAL CARNATION SCARLET GLOW.
A valuable addition to its class; the colour of the flowers is rich scarlet.

It is difficult to get a bright clear colour in scarlet seedlings, often they become dull and slaty in mid-winter, but, worst of all, as a rule, all red varieties are very prone to fungoid diseases, and it is this which checkmates the grower, often destroying years of hard work.

Looking at some of the old varieties which have gone before, in England, Winter Cheer is the only parent which has produced worthy children. William Robinson, Christmas Cheer, and Elizabeth are a few, and Mr. A. Smith obtained for us that grand variety Britannia by crossing Mrs. T. W. Lawson on to Winter Cheer. But beyond these we have none of note. One of the best reds which ever came from the United States was the old variety America, that grand old pathfinder of years ago, which was a great red in its day, and deserved to be popular; we all liked that dull coral shade in England. Old Portia was very bright, but very small. Vesper never quite received the attention it deserved. G. H. Crane certainly was good, and it is from this variety that some of the best seedlings have come. Flamingo will always live in my memory. It was, and always will be, my model flower for form.

Adonis reached the high-water mark for a rich bright pure colour, but the disease! oh! what a trouble it was in those days. Crusader, with its poor colour and soft growth could not survive, but Cardinal made a great stride, giving us a glorious rich deep scarlet, a real winter shade, but disease killed the Cardinal. Then came that battle royal between Robert Craig and Victory. They fought for supremacy at nearly every show in America, and their triumphs were narrated in the horticultural press. But where are those varieties to-day? Robert Craig was not free enough commercially, and the colour failed in mid-winter, while Victory, undoubtedly the better of the two, was, as a rule, defeated at the shows by its contemporary, which has only just died. None of us grow Victory now on account of it being so subject to rust disease. We have also freer flowering varieties. Defiance was an utter failure over here, and the more modern variety, O. P. Bassett, is not adapted to our climate, though it is still considered good in America.

So we have only three scarlet varieties left from which to select the winner—Britannia, Beacon, and the new aspirant to fame, Scarlet Glow. Britannia you all know, and undoubtedly have pleasure in its acquaintance. Beacon is certainly more productive than Britannia, and pays a commercial grower better. It is not subject to any disease, but, of course, does not make quite so noble-looking a plant, and the flowers are of orange-scarlet shade, and, according to the British idea, not so well formed, but Beacon grows much freer than Britannia in mid-winter. To my idea, however, the new variety, Scarlet Glow, of which a characteristic illustration is given herewith, is head and shoulders the best scarlet perpetual carnation to-day. The colour is the whole thing, and is a glorious shade. The flowers have a refined appearance and are of average size. The habit of growth is clean and healthy, and its productive power is up to any other variety, if, indeed, it could not lead on Beacon, certainly its closest rival.

Montagu C. Allwood.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

THE NEWER JAPANESE CHRYSANTHEMUMS.

It is, I believe, generally agreed that competition in the Japanese classes at the late shows was keener and the awards more closely contested than has been the case for several seasons past. Numerous instances have come under my notice where valuable prizes, first and second, have been won by the narrow majority of one point, and in one case but half a point separated first and second exhibits. This close competition goes to prove conclusively that any new and improved variety is a distinct gain. As an illustration I would mention the introduction of that charming variety the Hon. Mrs. Lopes two years ago. Compare this with General Hutton, Mrs. W. Knox, or even Bessie Godfrey, and it will be found that an exhibitor who has Mrs. Lopes instead of either of this trio would add at least two points to his aggregate. I do not, of course, say this because the variety is new, but because it is an improvement on existing varieties of a similar character. With a view of assisting exhibitors who have not an opportunity of seeing the new varieties I give below a selection of those deserving of a trial.

Foremost in the list is Ernest G. Mocatta (Jones), named after the employer of one who can safely be termed this season's champion in the Japanese section—Mr. T. Stevenson, of Woburn Place, Addlestone. The newcomer was obtained as a sport from Edith Jameson, itself quite one of the best of Japanese varieties in shape and refinement, and as so well represented in the present illustration, E. G. Mocatta possesses these characteristics in an eminent degree, and the blooms are fully as large as those of the parent. In colour it is clear bright canary yellow, and it has rather a wider and thus a better petal than its parent. D. B. Crane (Silsbury) has extra long drooping petals, which build up a full-sized shapely bloom. In colour and shape it is, perhaps, best described as a bronze form of the Hon. Mrs. Lopes; F.C.C., N.C.S., and is of large size.

Countess of Granard (Herbert) is in form between F. S. Vallis and General Hutton, therefore quite desirable. In colour it is a rich yellow, with an emphasised centre, at times tinted bronze.

Mrs. G. C. Kelley (Wells) is a broad-petalled incurving variety of large size, displaying more of the silver reverse than the rosy amaranth of its surface. Mrs. George Hartman (Jinks), F.C.C., N.C.S., is a large, full flower, made up with narrow florets of a rich crimson terra-cotta hue.

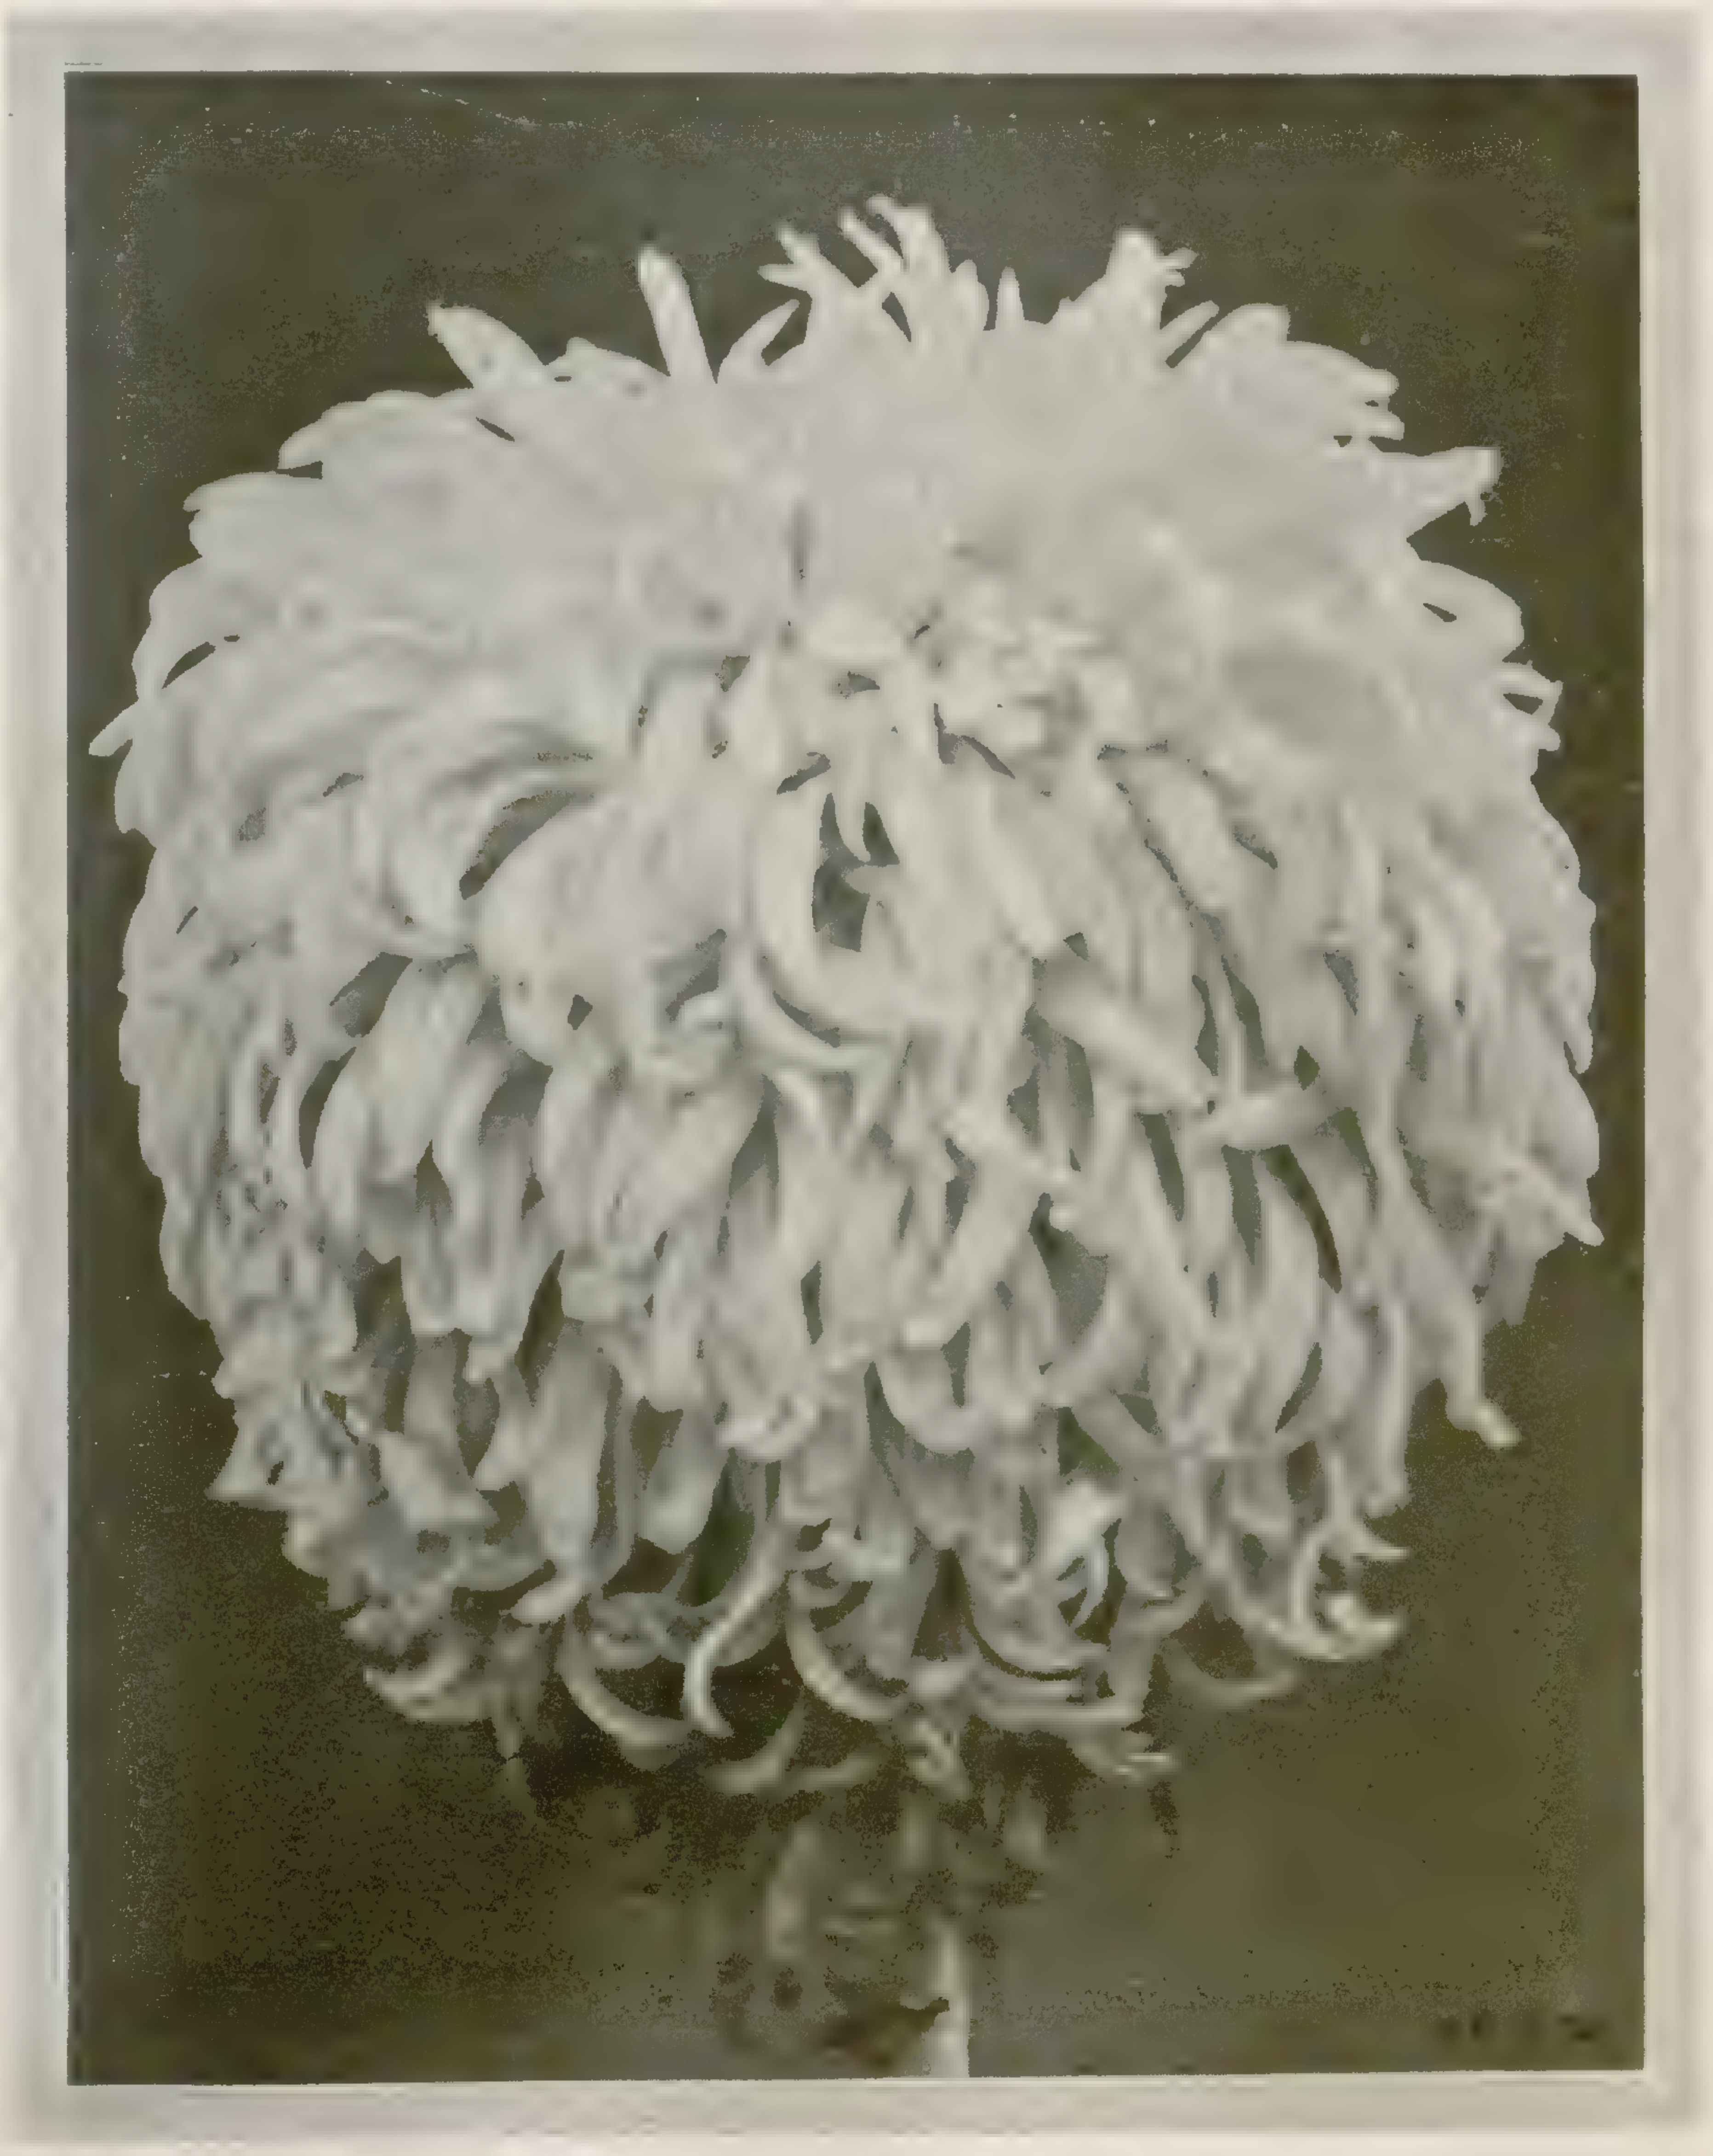
Mrs. F. C. Stoop (Davis), F.C.C., N.C.S., reminds one somewhat of Belle Paule in its formation, and is therefore quite a desirable variety. The colour is silvery-white flushed with rose-pink. Henry Poulton (Poulton), F.C.C., N.C.S., gives quite a striking colour—an intense crimson blood-red—with a buff reverse. It is, however, the surface colour we especially need, as varieties of that type are becoming fewer. Mrs. A. Herbert (Herbert) was commended by the N.C.S. on October 24. The creamy-white florets are broad, reflex evenly, and build up a full-sized flower of high quality. F. Chandler (Silsbury) has long, wide petals building up a deep bloom that is red on the surface and has a golden reverse.

Mrs. R. A. Witty (Wells), F.C.C., N.C.S., is a full-sized flower, with broad florets; chestnut-crimson on the surface, with a bright buff reverse. Mary Poulton is a large, full flower, with reflexing florets of a shell-pink colour. Fred Green (Silsbury), is a striking variety in colour—rich velvety purple; though not so large as some would wish, the reflexing curling florets make up a shapely bloom. Queenie Chandler (Silsbury) has prettily curling florets of a soft primrose colour. Leviathan has a creamy-white ground, striped and suffused with lilac-pink. This variety requires good cultivation to obtain blooms of its fullest capacity and of a high standard of merit.

Frances Joliffe, although not one of the newest varieties, is so striking in its colour and so shapely that it should not be omitted from a selection. In colour it is creamy-yellow, edged and tinted light pink. Empress, lemon-yellow, is a full large bloom of desirable shape. In growth it is rather delicate, and does not require a large pot. In Evangeline we have two colours at variable seasons; in October it is white, and later we have a suffusion of lavender; quite an interesting variety, and its only fault is that it is a little early for the November exhibitions. White Queen (Silsbury); as white-flowering varieties of the highest class are becoming more scarce, this charming variety cannot be overlooked, although it may not be so large as some would desire. In form it is superb, and its pure white florets have a semi-drooping character, making up quite an elegant flower. Purity is another variety I would like to see much more common on the exhibition tables, for whether in vases, on boards, or in a mass in one large vase, it is a superb variety, so shapely, so full, and not in the least bit coarse.

Marie Loomes (Wells) is a large, yet flat variety, with florets which droop and curl at the tips. In colour it is rosy-crimson with a buff reverse. W. Mease was well staged during the season at various shows; blooms developed from late-formed buds give the real colour, rosy cerise, so that I must recommend the variety to those who have not previously grown it, but with the caution not to attempt to flower it from early buds. Lady F. Ryder (Perkins) is an exceptionally deep flower, with medium-sized strap-like florets of a glistening white. Harry Wood (Perkins) is quite a gem in colour, rich crimson, and is full size when seen at its best. William Turner (Wells) is a promising pure white variety, with incurving florets, occasionally curling and building up a solid full-sized bloom; F.C.C., N.C.S. Thorp's Beauty has medium-sized petals, rosy-red with a buff reverse.

E. Molyneux.



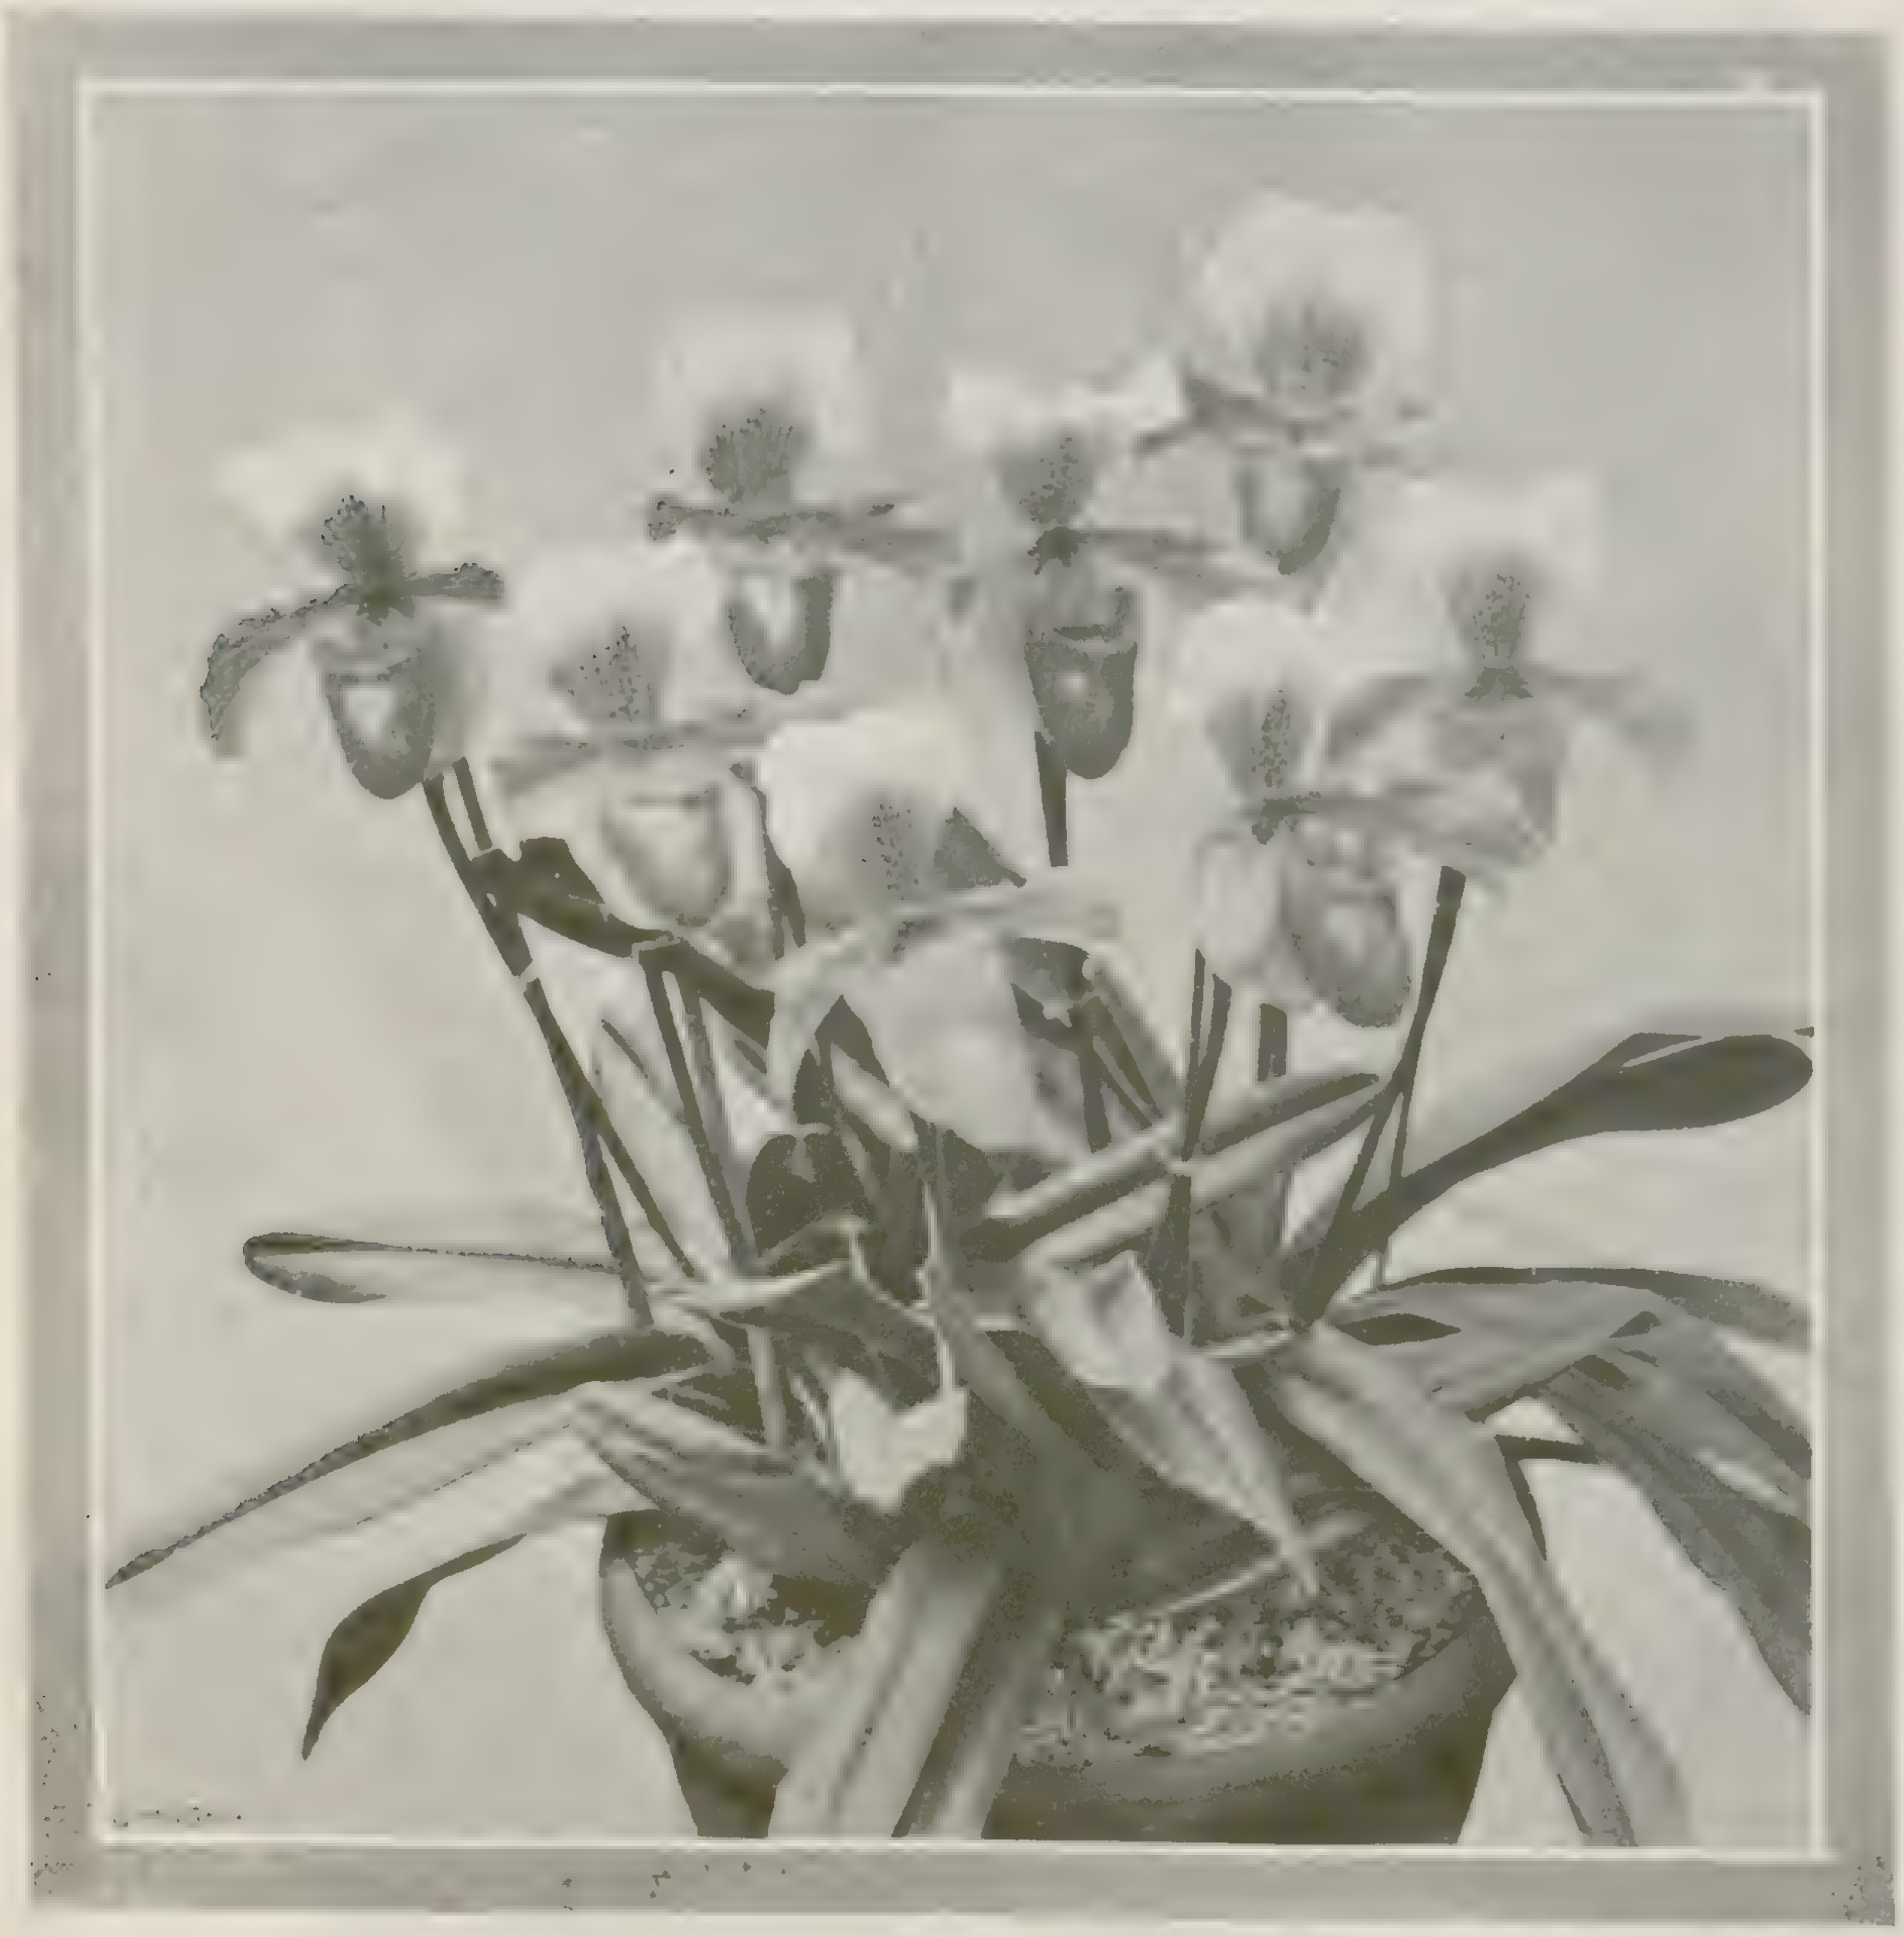
CHRYSANTHEMUM ERNEST G. MOCATTA.

A beautiful new variety which originated with Mr. T. Stevenson as a sport from Edith Jameson. Flowers much reduced, and of a rich yellow colour.

Dwarf Plants for Banks.—You will sometimes have a steep bank that is a perpetual worry to you; grassed down it is always difficult to work, and never looks well, or it may be loose in nature, and want holding together, and, above all, it must be kept low. In this direction Genista hispanica and Berberis dulcis nana have great merit; in growth they are very compact, developing into ball-like masses, that, when in flower, appear like masses of gold. In positions like that indicated above these subjects grow with absolute freedom, and, in company with them, we may have all the dwarf kinds of cistus, a group of shrubs that are always most lavish with their flowers. Where greater variety than this is called for add Cotoneaster congesta and adpressa, with Cytisus kewense, and genistas like tinctoria fl.-pl., radiata, pilosa, and prostrata.—Thomas Smith.

THE EARLIEST ALPINE FLOWERS.

Few flowers appeal to us so much as do the harbingers of the spring—flowers which venture to brave the inclemencies and the austerities of the early days of the year and serve as the heralds of the great procession of their sisters which are on the way to gladden us in the later seasons. They seem to entwine themselves round our affections, and we welcome them as we do no other flowers, partly because of their earliness, but largely because of their own intrinsic beauty, modest though it often is. Born in adversity, cradled in the midst of hardships, they appear sweetened by their trials, and give us greater delight than their still fairer sisters, which are so plentiful in the later months.



CYPRIPEDIUM W. J. MILES.
A beautiful hybrid, raised by F. Wellesley, Esq.; the flowers are white and yellow.

Many of these earliest flowers have bulbous or tuberous roots, and constitute a large proportion of the advance guard which ushers in the later flowers. They are generally familiar enough, and need only be mentioned now to show that they have not been forgotten, and to serve as a reminder to those who have not utilised them sufficiently for the adornment of the alpine garden.

Thus we have the snowdrop, the virgin flower of the winter days, lovely in clumps by themselves on the rockery, but more lovely still in sheets among the helianthemums and other low-growing evergreen shrubs. Then we have the earliest irises, such as the reticulata group, including histrioides, Krelagei, and even the lovely Actor iris, itself, I histrio, although it is a little too tender for many gardens.

Iris alata, a lovely thing, is not hardy enough for many places either, and the exquisite I. stylosa requires either a frame or a dry, sunny nook in the rock garden, among stones and in poor soil, if we are to delight in plenty of its exquisite flowers, winter-flowering species though it is. I. Bakeriana and I. Bornmuelleri are perfect gems, and in I. Willmottiana we have another beauty of the first rank.

Crocus species furnish us with dainty flowers, beginning with the winter C. hyemalis, the little C. vitellinus, and others which may be found in the bulb lists, but of which lack of space forbids detail. Scillas also supply us with some flowers, and the bright blue Hyacinthus azureus is a gem of the first water for our garden of the earliest flowers.

The charming little Cyclamen coum affords its crimson or white blooms and little rounded leaves, followed a little later by C. ibericum. In the moister nooks of the rougher parts we have the golden flowers of the winter aconite, which, common though it is, must never be despised. Very early also a clump of the exquisite early form of the spring snowflake, Leucojum vernum carpathicum, droops white, green-tipped flowers, and supplies a foretaste of its later sisters' beauties.

Leaving these bulbous and tuberous plants, we come to others which appeal to us in other ways, and give us little cushions of verdure and dainty flowers, or plants of more upright habit of growth.

Of the latter is the exquisite Adonis amurensis, of which we have now several varieties. Either the double or the single form is charming, with its dainty foliage and its fine yellow flowers, which come very early in the year in a sunny nook of the rock garden. Common though it may appear, there is yet much value in a mass of the white arabis, especially in the dwarf variety, that passes by the name of Arabis albida compacta, which I have ofttimes had in flower in January, although there was but a sprinkling of bloom at that time compared with the sheet of white later in the spring. Of aubrietias we may, in favourable seasons, have a spangle of flower from several, but the earliest of all seems to be a bright little one sold as A. Wallacei.

Two rare little flowers which are very charming in their way, are the dwarf plants called Helionopsis breviscapa and H. japonica. Their evergreen leaves, close to the ground, and their rosy-coloured flowers on short spikes, are charming in their season; they delight in a half-shady, peaty place, and are acquisitions of recent years.

Our old friends the hepaticas should always be remembered, and of all the varieties none will be found better for early bloom than Hepatica, or Anemone, angulosa major, although the other varieties of the same species, in blue, lilac, rose, or white, are lovely a little later. A modest little plant is Noccæa, or Iberis stylosa, with pale purple flowers in midwinter, if the season is a mild and sunny one.

Ofttimes, too, very early in the spring, we have the bright little yellow flowers of Morisis hypogæa, an exquisite alpine, with shining, pretty leaves.

Saxifrages, too, supply us with flowers, though they also vary according to the season. S. apiculata, S. Burseriana in variety, especially Burseriana major, S. Boydi and S. Boydi alba are among the most useful for the opening days, and in the megasea section S. Stracheyi and S. ciliata are the earliest with me. Nor should the lovely satin flower, Sisyrinchium grandiflorum, be left out of sight with its purple or white drooping bells and grassy leaves.

Such are some of the earliest alpine flowers. With the addition of the exquisite Erica carnea and E. carnea alba, together with E. hybrida, a few small mezereons, and violas and other plants which occasionally give blooms early, we may have the enjoyment derived from seeing our rock gardens brightened by lovely flowers at a time when these are generally scarce in the open ground.

S. Arnott.

A BEAUTIFUL CYPRIPEDIUM.

The cypripediums with flowers of varying shades of yellow, of which C. Sanderæ is one of the best known forms, have much to recommend them to the general body of cultivators, and their claims are so fully recognised that they enjoy a high degree of popularity. They, in common with many other of the lady's slippers, bloom at a season of the year when flowers are none too plentiful in the orchid houses, their flowers possess a degree of refinement that is not surpassed by those of other of the handsome cypripediums, now so numerous, and in colour they are quite distinct. One of the most beautiful of the yellow-flowered forms that have yet been submitted to public notice is C. W. J. Miles, a distinct hybrid, raised by F. Wellesley, Esq., Westfield, Woking, who has accomplished much excellent work as a hybridist of orchids. This variety originated as the result of a cross between C. Actæus Langleyense and C. Sallieri Westfield variety, and has large, finely formed flowers. The dorsal sepal is white, except at the base, where it is marked with a few purple spots; the petals and lip are rich yellow. The plant herewith illustrated was exhibited by Mr. Wellesley at the first of the two meetings held by the Royal Horticultural Society in December last, and attracted much attention.

HARDY SHRUBS FOR FORCING.

The cultivation of hardy flowering shrubs under glass is rapidly increasing in popularity, and their great value is becoming so widely recognised that they are extensively grown in most gardens where large quantities of flowers are required for decorative purposes during the early part of the year. There are so many kinds and varieties suitable for forcing purposes that it is possible to obtain varied and charming colour effects that could hardly be obtained at such an early season without a selection of hardy flowering shrubs. There is no difficulty in keeping the conservatory and corridor gay with flowers from the commencement of the year until the plants come into bloom naturally out of doors.

Most shrubs enjoy a liberal amount of root room, but when they are required for decorative purposes in the mansion it is often necessary to put them in pots as small as possible. It is important, however, that the plants be well furnished with fibrous roots, and well set with flower buds, and there will then be no difficulty in obtaining a good show of lovely blossoms. A good way to begin is to plunge the pots in a hotbed of leaves in a house where a temperature of from 60 degrees to 65 degrees can be maintained, keeping the plants well moistened with the syringe, while at no time must they be allowed to become dry at the roots. To have Azalea mollis in bloom at Christmas it is necessary to start them in the manner recommended six or seven weeks beforehand, but before the blossoms are fully expanded it is advisable to remove the plants to a cooler house to open, as they will then continue longer in perfection.

As soon as plants are obtained from the nursery they should be potted up and plunged in ashes in the open, for after they have been exposed to the elements they will force into flower more readily. With the advent of the new year shrubs may easily be brought into flower by standing them in an early vinery if it is not convenient to make up a hotbed for them.

Several lilacs are very useful for forcing, and of these Charles X., Madame Lemoine, and Marie Legraye are especially good. The pure white blooms of the last two varieties are always admired. Azalea mollis and its varieties are much appreciated, Anthony Koster being one of the best of these. Among cherries the lovely blossoms of Cerasus pseudo-cerasus fl.-pl. and C. pseudo-cerasus James H. Veitch, are highly ornamental. Prunus triloba is desirable for forcing, and is very telling when associated with white lilacs. Deutzia gracilis and D Lemoinei are worthy of extensive culture Pyrus malus floribunda is very popular, while P. Scheideckeri and P. spectabilis are also very fine. There are some lovely forms of philadelphus, and of these P. Lemoinei and P. Boule d'Argent are both valuable.

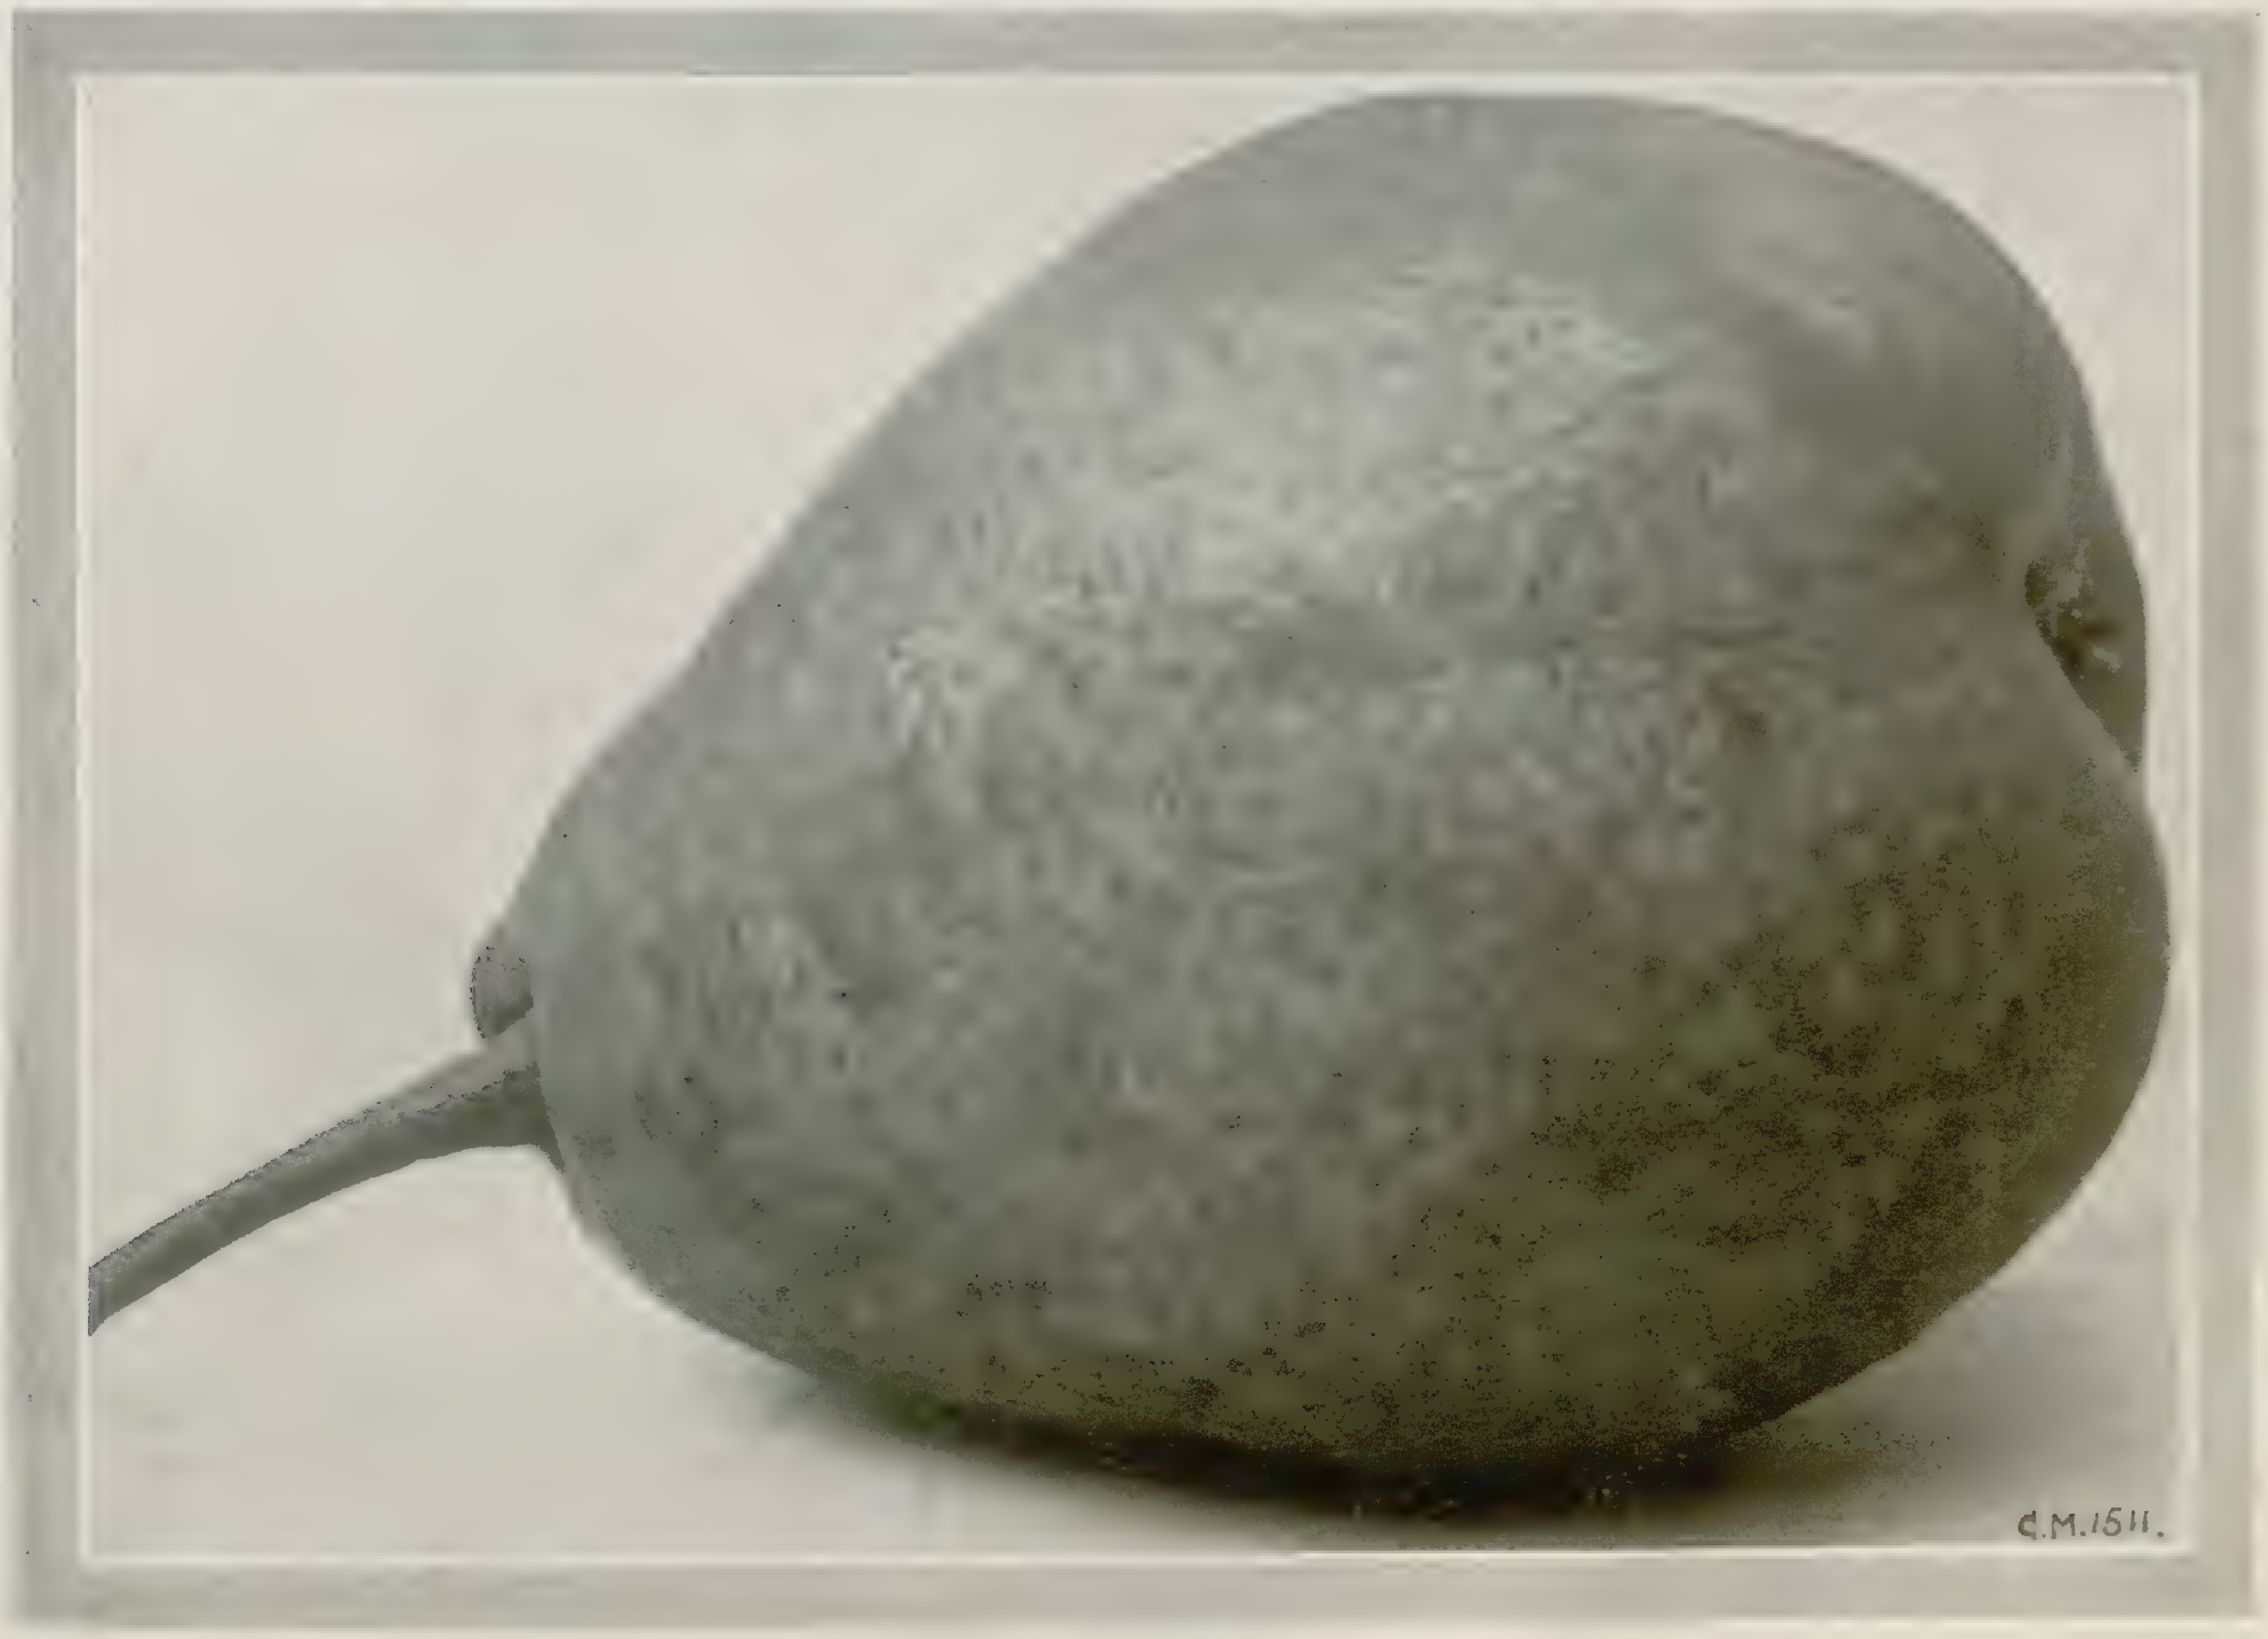
Several of the shrubby spiræas are very pretty and effective, S. confusa and S. arguta being especially so. Staphylea colchica makes a lovely standard, and its sweetly scented wax-like blossoms are always admired. Some of the viburnums should be included, and of these V. plicatum and V. opulus sterile are two of the most useful. Magnolia conspicua, M. stellata, and M. Soulangeana are all handsome, and valuable for conservatory decoration, but I do not recommend these for very early forcing. Wistaria sinensis is seen to advantage in standard form, as its heads of bloom project over the dwarfer subjects in a very graceful and pleasing manner. Standard specimens of Hydrangea paniculata grandiflora and Laburnum vulgare are also effective, when arranged in groups with deutzias and spiræas to hide the pots.

There are various other shrubs suitable for forcing purposes, but those mentioned above include most of the best, and will be found sufficient to furnish a regular supply of bloom during the early months of the year.

J. GARDNER.

PEAR FONDANTE DE THIRRIOTT.

Although there is no dearth of good dessert pears ripening during the months of October and November, it appears desirable that prominent attention should be directed to Fondante de Thirriott, with a view to it being more largely represented in gardens than is at present the case. It is certainly one of the finest pears in its season, and for that reason it should be included in selections of pears for gardens of moderate dimensions, as well as in those of large extent. The tree has a good constitution, is upright in growth, and forms an excellent pyramid or bush. It is also admirable for cordons and espaliers, and on walls it may be successfully grown as a fan-shaped or horizontally-trained tree. The adaptability of the variety to the various forms of training that now find favour is a strong recommendation, and not less important is the fact that it may be depended upon to produce a heavy crop in whatever form it is grown. The fruits are comparatively large, handsome in appearance, and rich in flavour; the shape of the fruit is shown in the accompanying illustration; the skin is yellow, tinged with orange, and the flesh is firm, rich, and juicy.



PEAR FONDANTE DE THIRRIOTT.

SUTTON PLACE, GUILDFORD.

The beautiful county of Surrey contains many a goodly garden, and one of the newest, though at the same time one of the oldest, is at Sutton Place, near Guildford, the residence of Lord and Lady Northcliffe. The garden is new in that its largest and most interesting feature has been developed within the last eight years. The garden is old, for here are magnificent Cedars of Lebanon that must have been planted soon after this grand tree was introduced into England. Indeed, the garden is older than the giant cedars, as Sutton Place was built in 1521, the year after Henry VIII. of England and Francis I. of France met at the Field of the Cloth of Gold. No doubt some of the garden walls on the western side of the mansion are of the same age, and the tough old bricks, riddled with nail holes, may possibly have served to shelter some of the earliest peach trees that reached this country.

[Photo., H. N. King.

THE NEW ROSE GARDEN AT SUTTON PLACE.

The house itself occupies three sides of a square, and the garden side is chiefly occupied by a grand old banqueting hall and the long ladies' gallery. Fine old tapestries adorn the walls, while the furniture includes a table at which Henry VIII. and Cardinal Wolsey dined, a couch that belonged to Charles I., and a desk at which Charles Dickens did much of his writing. Works of art and articles of vertu from many lands, and belonging to many times, have been gathered here by Lady Northcliffe, and a mere catalogue of them would fill much space. The great library is a place in which one could linger long, but its most striking feature is the remarkable contrast it affords between the early part of the sixteenth and the early part of the twentieth centuries. Here, where it is quite easy to people the place with courtiers of the time of Wolsey and his master —for the builder was a great man with the King—Lord Northcliffe directs and controls the huge publishing business that includes the vivacious "Daily Mail" and the stately "Times," as well as countless magazines. From here, by way of London, an enormous influence is exerted upon the nation, the empire, and the world. His Lordship's operations circle the globe, he is in daily communication with those who in far Newfoundland are converting the forests into paper for his publications, and yet he is as keenly interested in "The Times" Experimental Station, where Mr. Foster is proving for him that intensive culture may provide us with much of the choice garden produce we now import. Great affairs of state, in this and other lands, are soon known in this quiet room, but they do not blot out his Lordship's desire and endeavour to naturalise the American robin in British gardens. The contrasts are extraordinary, and probably it is due to them, and the garden surroundings, as much as to his capacity for finding the right man or woman for each of his many ventures, that Lord Northcliffe is able to control such a vast business without being overwhelmed.

The Wild Garden.

A great deal of the "wild gardening" of to-day is an excuse for neglect. In some instances the naturalisation of hardy exotics or the spread of the choicer native plants is taken in hand, and with charming results; these also come under the heading of wild gardens. But we want a new title for such a garden feature as that so splendidly expressed at Sutton Place. It is a natural garden wherein deciduous and evergreen flowering shrubs, and hardy perennials are planted in colonies, in irregular beds and borders cut out of the grassy slopes that descend to the River Wey. There are about eleven acres so cultivated, and the garden extends rather more than a quarter of a mile along the valley. Large numbers of trees, elm and birch and poplar, grow close to the river's brim, while magnificent old oaks grow at intervals higher up the slopes. The trees give shelter from keen winds, there is abundant moisture at all seasons of the year, and as the aspect is due south the garden has the full advantage of all available sunshine.

Everything is kept clean and tidy in this garden. The grass pathways are closely mown, and weeds are not allowed to compete with the cultivated plants. The whole place is "gardened"; it is of immense interest at all seasons of the year, and never lacks the beauty of flower and leaf from January to December. Even at Christmas and the New Year the colonies of hardy heaths are beautiful, the spreading cotoneasters have not lost quite all their brilliant berries, a few primroses anticipate the spring, Christmas roses raise their pure white blossoms, andromedas are beautiful, encrusted saxifragas glisten in the winter sunshine, and the deep glossy green of the rhododendrons yields a cheery note.

In the springtime myriads of bulbous flowers bloom, to be quickly followed by a wonderful range of flowering shrubs. Summer finds the floral pageant at its height, while in the autumn time great breadths of liliums yield beauty and fragrance, and the Japanese maples, cornus, and oaks presently light up the valley with their glowing leaf colours. Lady Northcliffe is herself an enthusiastic and clever gardener, with a great love for hardy plants, and the development of this valley into a glorious natural garden is due chiefly to her.

[Photo: H. N. King.

THE LAVENDER WALK IN THE SUTTON PLACE GARDENS.

In the space at command it is quite impossible to mention even a tithe of the subjects planted in this happy valley, but among shrubby plants are included heaths and rhododendrons, spiræas, cotoneasters, Japanese maples, Ghent and mollis azaleas, roses, lilacs, philadelphus, andromedas, prunus, pyrus, ceanothus, tree lupins, lithospermums, helianthemums, Buddleia Veitchi, bamboos, and Romneya Coulteri, the latter growing finely close to the retaining wall at the top of the slope. Primulas grow splendidly, and in addition to fine strains of primroses, polyanthuses, cowslips, and border auriculas, there are colonies of P. japonica, P. pulverulenta, P. Veitchi, the brilliant P. Cockburniana and its hybrid descendant, P. Unique, with P. rosea, P. viscosa, P. capitata, P. denticulata, and many others. P. japonica extends beyond the garden proper, and has taken possession of the banks of numerous rivulets farther along the valley. Many beautiful combinations have been worked out, and they may be easily copied in other gardens. Muscaris and double white arabis, various thymes under dwarf Japanese maples, Primula rosea and Lilium pardalinum, are three of them. The low-growing plants are not only beautiful themselves, but they hold the light soil together, and form an admirable setting for their taller companions. Heucheras, sidalceas, and hemerocallis thrive splendidly and occupy large areas. Large sheets of hardy cyclamen spread under and close to the big oaks. Iris Kæmpferi is freely planted by the waterside, and in favoured sites are to be found colonies of Cypripedium spectabile, C. calceolus, Orchis foliosa, Meconopsis Wallichi, and M. integrifolia. Shortia galacifolia is a great success halfway up the slope, and the new and pretty Thalictrum diptérocarpum is quite at home.

One portion of the slope takes the form of a rock garden; this has been replanted recently, and already the saxifragas, primulas, choice aubrietias, alpine pinks, violas, and phloxes show their appreciation of the new soil. New work is in progress near by, and big boulders are being placed in position to keep up the soil in a ravine, where alpine shrubs and other delightful things will find a comfortable home.

Rose and Water Gardens.

There are two rose gardens at Sutton Place. The old one is sheltered by ancient walls, and on the wall that faces south beautiful roses bloom long before those in the open begin to flower. A stout pergola down the centre carries Wichuraiana and other roses, as well as clematis and a few other climbers, and, clustering round the roots of each climber are groups of the lovely Lilium candidum. Beds and borders of free flowering H.T. and H.P. roses are planted in the grass plots on either side of the pergola, and such violas as Archie Grant, Lord Elcho, Maggie Mott, etc., are closely planted beneath the roses to form a charming carpeting for them.

The new rose garden is well in front o the cedars, and is surrounded by a neatly clipped yew hedge. In the summer it was gay with masses of Captain Christy, Caroline Testout, Frau Karl Druschki, Joseph Low—which does very well in the beds, Madame Abel Chatenay, Auguste Rivoire, Gustave Regis, Hugh Dickson, Mrs. W. J. Grant, and a few others. This garden is of quite formal design; there are roses on arches as well as those in the beds, and a pretty fountain fills the centre of the scene. This autumn all the roses have been lifted and laid in elsewhere, and all the beds have been deeply trenched and manured, and now wait for a favourable opportunity to be replanted. In the light soil at Sutton Place it is necessary to manure heavily to obtain success, and Mr. Goatley, the able gardener, with nine years' experience of the ground, adds manure with a freedom that would appal most growers, but in due season he uses lime freely also.

In addition to the water gardening that necessarily forms part of the scheme in the fine natural valley garden already referred to, there is a formal, hedge-encircled water garden not far from the new rose garden, and only separated therefrom by an orchard of young standard fruit trees that was planted chiefly for the sake of the blossom display in springtime, though, of course, there is no objection taken to the fruit that may follow. Some large trees of the

Libra peach out in the open here look in first-rate condition, but Mr. Goatley suggests that a good turnip is better eating than a Libra peach from these trees. Bamboos cluster near the water edge in the water garden proper, and big groups of the choicest varieties of the gorgeous Iris Kæmpferi have been planted.

The Flower Borders.

A very fine feature of the older part of the garden is the arrangement of flower borders. These are everywhere. They intersect the fruit and kitchen garden squares, and extend along under the outer walls. They yield enormous quantities of flowers, and in several instances the planting is very cleverly done, and there is a continuous display from spring to late autumn. In most cases the planting is in groups, and each group may consist of two or three subjects, that will follow each other in the floral calendar, and yet not interfere with each other's development. Heavy manuring, deep trenching, frequent transplanting, and rather close planting are the chief points observed, and the result is first-rate. Bulbs are planted everywhere among the herbaceous plants, but there are also borders devoted largely to them. One long border of Darwin and May-flowering tulips, fifty bulbs or so of a variety, and the varieties of the best, ought to be a grand sight in the coming May. Yet another border is occupied by choice herbaceous pæonies, and when their bright red, bronze, and purple growths rise well above the soil they will have an accompaniment of Golden Spur, Albicans, Cynosure, Sir Watkin, and other daffodils. A border of pink aquilegias is thickly planted with Darwin tulips; another border is devoted to perennial asters, another to blue delphiniums and pink Canterbury bells, and another, the blue border, is shared by Delphinium Belladonna and the Dropmore variety of Anchusa italica.

In the western border, that is in a line with the garden front of the mansion, close planting is the order, and it provides a fine object-lesson in the art of producing a continuous display without recourse to big stocks of reserve plants. The bowling green is in front of this border, and it has a long hedge of lavender, while not far away is a long border filled with this fragrant shrub. There remains at least one other border, and it runs at right angles to the mansion, separating the lawns and garden proper from the finely timbered park beyond. This is the iris border, and I fancy it is unique; 700 feet long, ten feet wide, and backed by a hedge of Paul Transom and Dorothy Perkins roses, it contains thousands of plants of the finest irises that come within the Germanica group.

Other Features.

My story is not ended, but my space is, so the details of kitchen and fruit gardens, of the fruit and plant houses, the orchid collection, the chrysanthemums, etc., must be omitted, though I cannot close without a reference to the sweet peas in the cold frames, sturdy little plants that will, all being well, provide a beautiful display of dainty and sweet flowers all the summer long, and be of unusual interest to Lady Northcliffe, for her Ladyship is this year the president—the first lady president—of the National Sweet Pea Society.

CHARLES H. CURTIS.

THE WATER GARDEN AT SUTTON PLACE.

CLEANLINESS OF ORCHARDS

The treatment of insect pests and fungoid diseases in fruit orchards has never received so much attention as at the present time. Doubtless this is due, in a larg measure, to the more intimate and correct knowledge of the nature of these attacks and the means of checking them. And not a little credit is due to the Board of Agriculture, whose efforts in this direction, and particularly with regard to the eradication of gooseberry mildew, have opened the eyes of many growers to the possibilities of preserving their orchards from disease and destruction.

Spraying Fruit Trees.

The thorough cleanliness of fruit orchards is a point of vast importance to the grower, for an unkempt or neglected plantation is a sure resting place for myriads of insect pests and resting spores of fungoid diseases. These find a safe harbourage in the odd corners of the garden, in the cracks and crevices of trees, on lichen and mossy growths, and in other suitable hiding places. Many of the best-managed gardens seem, for some obscure reason, to be incomplete without a few cankered and neglected fruit trees. The hand of the sprayer must not be raised against them, for in their picturesque dilapidation they presumably find favour in the eyes of the owner. This is to be regretted, for the chances of securing good fruit crops in other parts of the garden are by no means so good as they might be were these old and worthless trees cleared away or thoroughly cleansed. Spraying or winter washing is certainly the sole means of keeping them clean and free from insect attack, for when properly prepared caustic spray fluids are employed, the winter haunts of these pests may be cleared away, and their chances of surviving the winter season are then remote. Needless to say,the efficacy of winter washes depends in a great measure upon the ingredients composing them, the manner in which these ingredients are mixed together or emulsified, the method adopted in applying the mixture, and the fineness or force of the spray. Mistakes made in any of these various points often lead to serious loss, and waste of time, money, and materials. This, of course, will be much greater where the spraying is conducted on a large scale, but in a small plantation of fruits it will not be so considerable. It is certainly better not to spray at all unless the spraying can be done well, and with the best materials.

Winter Washing.

Young trees, such as standard or bush apples or pears, and espaliers or cordons, are very quickly ruined if allowed to fall into neglect. Of late we have noted that there has been a great increase in the spread of the woolly aphis, or American blight (Schizoneura lanigera). It is in the summer time that one can visit many orchards, especially in the Western districts, where the trees are covered with these woolly growths. The neglect of them is a serious menace to the surrounding fruit growers, for by means of the wool-like covering, which is exuded at the approach of warmer weather by the young lice or aphis, the latter can easily be transported on the feathers or feet of birds, by wind, or by other agencies, to fruit trees growing around. For the American blight winter washing is the most effective remedy, and now is the time to commence operations. Among the different ready-made materials that may be recommended are Cooper's VI., and the Woburn Wash. A very fine multi-needle jet nozzle, and the greatest possible pressure, are two of the principal essentials in treating this pest, for ordinary light sprayings are incapable of penetrating into all the haunts of the hibernating aphis. In addition to the woolly aphis, the apple blossom weevil, the earwig, codlin moth caterpillar, etc., are hibernating pests which shelter under the rough bark of fruit trees, and especially in mossy or lichenous growths.

Formula for New Alkali Wash.

The modified form of the old alkali wash consists of caustic soda (98 per cent.), sulphate of iron, lime, paraffin, and water. The proportions in which these various ingredients are mixed together, as recommended by Mr. S. U. Pickering, F.R.S., Director of the Woburn Experimental Fruit Farm, and given in these columns on several occasions, is as follows: Iron sulphate, $\frac{1}{2}$lb.; lime, $\frac{1}{4}$lb.; caustic soda, 2lb.; paraffin (solar distillate), 5 pints; and water to make up 10 gallons. To prepare the wash, the iron sulphate should be dissolved in about 9 gallons of water; the lime should then be slaked in a little water and well stirred, a little more water being afterwards added to form milk of lime. The latter must then be strained through a fine sieve or piece of coarse sacking into the iron sulphate solution, so as to remove grit or coarse particles that may be suspended in the liquid. The paraffin should then be added, and the mixture churned thoroughly. When all is in readiness, and the washing is about to commence, the caustic soda, in powdered form, should be added in order to complete the wash. Care must, of course, be exercised in handling this wash, as it has a caustic effect on the hands and clothes.

Spraying Machines.

For ordinary purposes, and in a small orchard or plantation, I have found that a knapsack sprayer answers extremely well, provided that a fine enough spray can be secured. The Alpha, the Abol, and the Four Oaks knapsack sprayers and syringes are all useful kinds.

EARLY OUTDOOR PEACHES.

The fact that early outdoor peaches ripen at a season when choice hardy fruits are none too plentiful considerably enhances their value, and this especially to those who have not the necessary conveniences for peach culture under glass, or, to speak more to the point, the convenience of cool or late peach houses. This being so, these fruits are therefore, in many instances, especially useful when grown in small gardens; and yet it is invariably in this description of garden, though they are much more numerous than are large ones, that outdoor peaches are not so frequently met with as they deserve to be.

HOLLOW-CROWN PARSNIPS AND AILSA CRAIG ONIONS.

These finely developed specimens are illustrated for the purpose of showing the advantages of deep and otherwise good cultivation.

The reason for this in many cases, probably is, the want of sufficient hands to give them proper attention, or the lack of other needful aids to insure success. There is not in outdoor peach culture, provided the necessary requirements are forthcoming, so many difficulties to surmount as is somtimes imagined, and, moreover, it could without doubt be successfully undertaken in many situations that are considered totally unsuited to it. It may here, as a recommendation, be said that peaches have, to my knowledge, in more than one instance, been successfully cultivated where the apricot, owing to damp atmospheric conditions failed.

As early peaches are valued, and cultivated chiefly on account of their precocity in ripening, they should, with a view to the further advancement of this desideratum be given the warmest position suitable to its culture, viz., a position on a south wall, or, failing this, the nearest available aspect from south to west should be selected. In situations of this kind, other things being favourable, the fruit will not fail to ripen as early as it can possibly be had from outdoor trees, and relative to this it may be observed that full exposure to the sun facilitates both the ripening and colouring of the fruit.

It may be observed that early outdoor peaches are deserving of special recommendation to those placed in late or otherwise unfavourable localities, where difficulty is found in properly ripening the fruit of late varieties, for in such cases the one may be had in good condition, while the other is flavourless. The wood of early varieties, in such instances, has also a better opportunity of maturing than has that of late ones, as, owing to their fruit being gathered comparatively early, the trees can likewise be sooner relieved of surplus wood, and thus permit the fruit buds to become ripened.

Another point relative to the proper ripening of the wood is the necessity of keeping the roots from penetrating deeply into the soil, which, when allowed to happen, surely promotes the growth of sappy and unfruitful wood. Other points of management that should be strictly acted upon are those of avoiding the crowding of shoots by timely attention to disbudding, careful attention to the protection of the blossom from frosts, spraying with a specific to prevent leaf curl, and to syringing the trees with water and insecticides in order to both keep them clean, and also free from injurious insects

The following can be depended upon as first early outdoor varieties: Amsden June, Duke of York, Hale's Early, River's Early York, and Waterloo, and as second early, Early Grosse Mignonne, Dr. Hogg, Dymond, Crimson Galande, Bellegarde, and Grosse Mignonne.

Thomas Coomber.

FOUNDATION OF SUCCESSFUL VEGETABLE CULTURE.

Probably no branch of gardening has made such rapid strides during the past twenty-five years as the cultivation of vegetables. Not only is this noticeable in relation to improved varieties, but also in culture. Much of this advance is due, I am fully convinced, to the encouragement given at the great majority of our horticultural shows. The newly-formed National Vegetable Society, which held its first exhibition during the past season, and of which the Duke of Portland is the honoured president, is doing a great work, not only by carrying out successful trials in various parts of the country, but by offering substantial prizes. Probably the late show brought together the finest array of vegetables of a very high standard ever seen. Not only were these largely exhibited by the professionals and the trade, but the amateurs and cottagers staged specimens of a high degree of excellence.

At one time it was generally supposed that only those in favoured positions, with the best possible soil, could ever hope to successfully compete for the valuable prizes offered, but this has been proved erroneous, for when the proper methods of cultivation are understood even the most uncongenial soils may be brought into such a state of fertility that almost any kind of vegetables can be successfully cultivated thereon.

Preparation of the Land.

This must always be the initial effort of anyone who is bent on attaining the best result, for unless it is persistently and properly carried out success is impossible. I may, perhaps, appear to hold extreme views on this point, but having had to deal with various kinds of soil, including sandy, chalky, and heavy clay, I have always persistently put into practice that which I have frequently expounded. My contention is that the ground generally devoted to vegetable culture is expected to do duty as such for a great number of years. Consequently it is of the highest importance that the whole of the soil to the depth of at least three feet should be brought into a fertile condition as speedily as possible.

I therefore strongly advise in all cases that extreme measures should be taken at the earliest possible moment, and the subsoil brought to the surface, instead of allowing it to remain where the beneficial effects of the air and weather cannot reach it. It is most essential that a proper system of drainage below the depth to which I have referred is always carried out. Many an old garden which has been in use for a number of years may still be found with only a comparatively thin layer of workable soil—surely a great mistake, and one which should be remedied at all costs. We should hear much less of the failure of many crops, especially during extreme spells of drought, if this was rectified.

Manuring.

Although it is impossible to continue producing first-class vegetables without the aid of suitable manures, it is possible to apply too much manure, particularly for some kinds of vegetables, and especially in old gardens. Good farmyard manure is still, in my opinion, the most suitable for the majority of crops. On light lands nothing is better than good cow manure, and on still retentive soils London or stable manure is certainly the best. For the majority of root crops, such as, for instance, beetroot, carrots, parsnips, salsify, and the like, no manure of any kind should be added for the current crop. Where the land is deficient in lime free applications of this should be added to the surface as the trenching proceeds.

Another most valuable ingredient for all kinds of land is the remains of burnt garden refuse, and soot should be freely used on crops during the growing season, while, in addition, many of the patent vegetable manures are highly beneficial, systematically applied whilst the crops are in active growth.

Rotation of Crops.

This is another point which requires most careful study, and cannot be too strongly emphasised. Generally speaking, the site should be changed annually for the various kinds of vegetables, and it is most essential that none of the brassica tribe be grown successively on the same piece of ground. A few crops may be successfully grown on the same plot for many years, and I refer here to onions, potatoes, carrots, and Jerusalem artichokes, providing, of course, suitable ingredients are incorporated annually, and a system of deep culture is carried out.

INTERMEDIATE CARROT SCARLET PERFECTION.

A fine intermediate type introduced by Messrs. Dickson and Robinson, and illustrated for the purpose of showing the advantages of careful selection and good cultivation.

Mulching.

This is another important factor, and applies equally to all sorts and conditions of soil, and nearly every crop is much improved, especially during the hot days of summer, by a thorough dressing of good material. It not only prevents the cracking of the surface, but it does a great deal to conserve the moisture and keep the roots cool. Long stable litter is preferable for the larger-growing crops, which will include peas, beans of sorts, the various brassicas, globe artichokes, etc. Old hotbed or mushroom bed manure may be advantageously applied to the smaller-growing crops.

Watering.

This should be carried out in no half-hearted fashion during spells of drought, and, as far as possible, it should be applied late in the afternoon. Properly diluted sewage is of great value to the majority of kitchen garden crops, and means should always be taken, wherever practicable, to conserve some of this for such purposes. Syringing the growth during the evening after a hot day is much to be commended, taking care to use water which has been exposed during the day, which should, of course, be as clean as possible.

Seeds.

It is of the utmost importance that good seeds and reliable stocks should always be sown, for it is well to remember that just as much trouble is needed to grow a bad variety as a good one. Another point which is worthy of consideration is that the seeds should not be sown too thickly. It is always a good plan to endeavour, as far as possible, to sow just twice as thickly as is necessary, and thin the seedlings to the required distance before any harm is done. Ample room should always be allowed for each specimen to freely mature: overcrowding, in far too many cases, is the cause of failure.

Transplanting.

This should always be carried out with care. The land must be properly prepared, and the various plants should be put out when quite small, disturbing the roots as little as possible; make them very firm, and give a good watering in whatever the weather may be, and take care that the young plants feel their removal as little as possible.

Sowing at the Right Time.

More thought should be given to this than is generally the case. Though there are several kinds of vegetables which may be sown at intervals during the year, and, indeed, it is necessary to do so to keep up an unbroken supply, there are others of the utmost importance which can only be successful when sown at the right time. Especially does this apply to winter and spring vegetables; for instance, if cabbage, cauliflowers, or autumn-sown onions be sown either too early or too late, even a few days, failure is inevitable. One frequently sees the spring cabbages prematurely running to flower when they should be turning in good heads; cauliflowers heading in when the plants are quite small, and the autumn-sown onions throwing up flower spikes instead of bulbing. To illustrate another case, celery, if only sown a few days too soon in the spring of the year, will frequently commence to throw up its flower spike prematurely in the autumn, which renders the crop practically worthless. In the past year this has been very noticeable, as I have frequently observed when judging at various exhibitions.

EDWIN BECKETT.

There is no better guide to the kitchen garden than VEGETABLES AND THEIR CULTIVATION, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CLAY'S FERTILIZER

OFFERS YOU GREETING AND A YEAR OF PROSPERITY IN THE GARDEN.

"'Tis not in mortals to command success;"
But he this human gift supreme displays,
Who forms a garden from a wilderness,
Aided with forces vitalised by **CLAY'S.**
Such fructifying power the soil obtains
That Flowers and Fruits profuse and fair appear;
And he that has this potent factor gains

The Glowing Promise of a GLAD NEW YEAR.

Sold in Tins at 6d. and 1/-; and in Branded and Sealed Bags:

7 lbs.,	**2/6**
14 lbs.,	**4/6**
28 lbs.,	**7/6**
56 lbs.,	**12/6**
112 lbs.,	**20/-**

Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except **6d** Tins).

ANNUALS FOR CUTTING.

No matter what the season may be, annuals always play an important part in the adornment of our gardens, and as suitable subjects for maintaining a supply of cut flowers during the greater part of the summer and autumn months. True it is, in the opinion of some persons, they are considered but second-rate, when compared with herbaceous or choice greenhouse flowering plants, but to some extent this may be accounted for from the fact of their having been neglected, or grown under adverse circumstances, or their management not fully understood. Experience teaches us, however, that with care and good culture most annuals will hold their own against other rivals, and at a considerable reduction in the cost of production, an item nowadays seldom lost sight of either by amateur or professional.

The object of these notes is not so much the provision of a detailed list of suitable kinds or varieties for the purpose named, as to recommend this useful class of flowering plants, and so raise them to a higher position in our gardens generally. Take, for instance, the coreopsis family. No annuals are more useful, or acceptable, than these, where the various shades of yellow and bronzes are admissible. Arranged with their own foliage they form a simple, but pleasing decoration, second to none of our long-stemmed annuals. Generally speaking, it is better to grow annuals in separate beds, borders, or rows, for by so doing fresh ground can be allotted each season for the various kinds that may be grown, which is essential if the best results are desired, besides which they are more decorative as growing plants when seen in groups or masses. Cornflowers, scabious, marigolds—perhaps a too old-fashioned flower for some tastes, but valuable none the less—godetias, gaillardias, lupins, sweet sultans, poppies, lavateras, and larkspurs, besides a host of others too numerous to name, are invaluable as adjuncts to the garden for cutting purposes.

A point too frequently overlooked is the choice of foliage when arranging these flowers for room decoration. Nature has made the right selection without a doubt, and the foliage of each kind of flower is the proper kind to use. How often do we see maidenhair fern intermixed with asters, stocks, and such-like flowers—an incongruous mixture. Better by far arrange such flowers without any greenery whatever if the natural foliage of the flower be insufficient, or unprovided for, unless a more suitable form of foliage is at hand.

Two important points connected with the successful culture of annuals are sufficient space for the perfect development of each plant, and the prompt removal of all seed vessels as soon as they are formed, or, better still, the removal of the blossoms as soon as they begin to fade. By this means all the energies of the plant are concentrated in perfecting a fine specimen, as well as prolonging its flowering period.

The majority of really useful annuals may be successfully grown without the aid of glass—a recommendation seldom lightly passed over either by rich or poor. The lighter the soil the earlier in the season should the seeds be sown, thus giving the seedlings a better chance of becoming fully established before hot dry weather sets in. When the seedlings are peeping through the ground a sharp lookout should be kept for slugs and other vermin, as much damage is often done by these depredators.

W. HEDLEY WARREN.

CORFOPSIS DRUMMONDI.
An annual species bearing bright yellow flowers marked with crimson-brown round the disc, and of much value for the supply of cut flowers.

WORK FOR THE WEEK.

◆

WARM ORCHIDS.

DENDROBIUMS.—Many of the early-flowering deciduous dendrobiums will now be developing their flower buds. Where flowers are desired early in the year the most forward plants should be selected and removed to warmer conditions than those to which the plants at rest are subjected. Care must be observed to inure the plants gradually to the higher temperature, for if they are transferred direct to the hothouse it will be found that instead of flowers young growths will be produced. It is a safe plan to see the flower buds before removing the plants to quarters where they may be more liberally treated. The quality of the flowers is considerably influenced by the conditions under which they expand. It is impossible to obtain flowers of high quality in the months of January and February, even in the most favourable positions. Both substance and colour are inferior as compared with those of the same plant when opened later or when the light is stronger. It is therefore advisable to retard rather than accelerate the flowering season, unless the plants are really required to flower early in the year.

SEEDLING DENDROBIUMS should be kept under careful observation, and as soon as young growths appear any repotting necessary should be attended to. All such work that can safely be done now should be proceeded with.

IMPORTED DENDROBIUMS.—The season has now arrived when importations of D. Wardianum, D. nobile, D. crassinode, D. aureum, D. Falconeri, D. Finlayanum, etc., arrive. It is really remarkable how large a number of plants of some of these species annually reach this country. They are readily sold when they arrive in anything like condition, and one almost wonders what can become of so many. If the early importations are in sound condition it is advisable to secure the plants required. I find it a good plan when they are first received to examine them carefully and cut away any dead or decaying matter, and otherwise prepare them for potting. This done, I prefer to delay their restarting into growth if possible until the end of February or the beginning of March. If a position on the stage in the resting house can be obtained, or even if they can be suspended from the wires of a trellis in a vinery in which the vines are at rest and the frost is excluded, it will suit the purpose. No water will be required, but as soon as they commence to produce new growths they should be potted, providing good drainage and using a compost of equal portions of fibrous peat, leaf-soil, and sphagnum moss. Refrain from watering if the compost is in a moderately moist state. As soon as potting is completed place the plants under slightly warmer conditions, but do not encourage a very rapid growth. As soon as the new roots are emitted more moisture both about the roots and in the atmosphere is required, and when the rays of the sun have obtained considerable power, growth will proceed rapidly, and must have every encouragement.

DENDROBIUM WARDIANUM has of late years been greatly sought after for the supply of cut flowers. I have noticed in prominent West End florists' shops during the past year innumerable quantities of bulbs covered with flowers cut short off at the base. I personally cannot regard this otherwise than as an undesirable method, as it results in the destruction of the plants. With D. nobile the case is different, as it blooms generally from the second bulb, but the flowers of D. Wardianum are produced on the leading growth. It may suit the cut-flower trade and trade growers to cut the bulbs with the flowers, but in private establishments it should not be countenanced unless ample means are at command for securing annually a stock of imported plants.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

CALADIUMS.—These highly ornamental foliage plants are always appreciated; and they are of great value for decorative purposes early in spring. For this purpose select the earliest ripened corms, and place them in boxes about an inch apart over a thin layer of cocoa fibre and coarse Bedfordshire sand. Put them in a light position where they will have a temperature ranging from 60 to 65 deg. They will not require much water beyond a daily spraying. Protect the young foliage by shading from bright sunshine, and as soon as the corms have formed roots about half-inch in length they should be potted singly, using 60's and peat with a liberal addition of silver sand. Do not press the soil very firmly about the roots, and extreme care must be exercised in watering, as dryness at the roots during the early stages is liable to cause premature flowering, which, of course, is very detrimental to the foliage. Caladiums seldom suffer from an excess of moisture. When required for indoor decorations the best course is to grow them exclusively in small pots, and when such root restriction has to be practised they must be regularly supplied with weak liquid manure.

POINSETTIA PULCHERRIMA.—Many of the poinsettias will have had their scarlet bracts used up in Christmas and New Year's decorations, and attention must now be devoted to ripening off the stock plants for the supply of cuttings. I would advise a good length of stem to be left on these plants, and if the foliage is already ripened off they may be placed in a dry position where the temperature does not fall below 55 deg. If convenient lay the pots on their sides to prevent drip reaching the roots. Should, however, the leaves still remain green after the bracts are used up, the plants must be given a light position with ventilation, and gradually dried at the roots until the ripening of the wood is complete.

EUPHORBIA JACQUINIÆFLORA. — Where the early displays of bloom have been cut or used up for house decoration a second supply of flowers may be obtained by placing the plants in a genial temperature and regularly syringing them until a successional crop of flower buds appear. The secondary flower sprays are always smaller, and generally inferior in quality to the first, but are of value for the pleasing colour of the flowers.

PLANTS AT REST, such as allamandas and similar subjects, ought to be examined at regular intervals, with a view to watering any that show signs of the bark shrivelling. When such specimens are allowed to suffer from excessive dryness they do not start so freely into growth. The temperature which during the past month has been reduced to 65 deg. may be continued for a few more weeks, and during severe weather it may fall to a minimum of 63 deg. for night temperatures, with about 5 deg. higher during the day.—JOHN DONOGHUE, Bardon Hill Gardens.

THE FLOWER GARDEN.

SHRUBS.—Although mid-winter is not the best time for planting, yet the work may be carried out safely during mild weather, and it is much better done now than deferred until March. All beds or borders should have a liberal top-dressing of decayed manure, old hotbed material being excellent for the purpose. This may be wheeled on during hard weather and lightly forked in when the opportunity occurs. Rhododendrons and azaleas will derive great benefit from a top-dressing of peat. Failing peat, leaf-soil will be found an excellent substitute. All newly-planted trees and shrubs should be securely staked to prevent the wind blowing them about and loosening the roots. Rabbits are in many gardens a great nuisance during frosty weather, and measures must be taken to guard against their injuring the bark of choice trees. The safest plan in the case of dwarf shrubs is to enclose them with wire netting.

HERBACEOUS BORDERS. — Providing the weather is suitable, the work of thinning and rearranging the various plants in these borders may proceed. The system of lifting every plant the border contains is altogether wrong, for whilst some require dividing every second year, others strongly resent disturbance. Strong growing subjects, such as phloxes, Michaelmas daisies, helianthuses, etc., ought to be lifted every second year, and heucheras, hellebores, pyrethrums, Gentiana acaulis, delphiniums, aconitums, and many others should be allowed to remain in the same position for a longer period. In lifting those that require dividing care must be taken to avoid mixing the several forms of the different kinds, as if this is done the confusion will be great when replanting. The ground must have a liberal dressing of well-decayed manure, and be deeply dug. In dividing the roots, the sides of the clumps should in the case of asters and phloxes be retained, and the centres discarded, as the shoots at the sides are invariably the strongest. When the replanting is concluded a top-dressing should be given to prevent the frosts penetrating to the roots, old hot-bed material being in every way suitable. Where the delphiniums require dividing the operation is best deferred till March, as mid-winter is not a good time to disturb them. A covering of ashes should be placed over the crowns of eremuri and ostrowskia. Iris susiana and I. Bucharica also need some protection, and handlights are most suited for the two latter. All liliums should receive a top-dressing of leaf-soil. The young growths of pyrethrums and delphiniums which are under the surface will require some protection from slugs.

HARDY ANNUALS.—In places where there is a large demand for cut flowers the hardy annuals will be most useful for maintaining a supply during the summer months. Good culture is essential, and thinning, staking, etc., must be attended to at the right time. Now is the time to select a piece of ground intended for their cultivation. A liberal dressing of well-decayed manure should be given, and the ground deeply dug, leaving the surface in a rough state, to allow the frosts to act upon it. Where there is any difficulty in growing mignonette a small quantity of mortar rubble, mixed with the soil will prove beneficial. Now that the ordering of the new stock of seed is being considered, a few that are specially suitable for supplying cut flowers may be mentioned. Sweet peas, Shirley poppies, annual chrysanthemums, cornflowers, scabious, large-flowering sweet sultans, double godetias, clarkias, mignonette, Gypsophila elegans, and annual mallows.—E. C. POOLEY, Gnaton Gardens, Plymouth.

FRUITS UNDER GLASS.

EARLY VINERY.—Where grapes are desired early in June no time should be lost in preparing the house for starting the vines. The vines should at once be pruned, and if the wood is thoroughly ripe, as it should be for early forcing, prune to one strong bud. Leave two if there is any doubt of the vines breaking satisfactorily, but it should be borne in mind that the longer you leave the spur the sooner the vines will become ungainly. When the vines have been pruned clean the rods thoroughly with one of the many preparations now available, but the old-fashioned mixture of soft soap, nicotine, and sulphur is a good one. Pull off any loose bark that may be hanging, but do not injure the vines by scraping. When this is done tie up the vines, and thoroughly clean the glass and woodwork, using a strong solution in warm water of soft soap and petroleum, taking the precaution of searching every crevice, for it is in these that the insects hibernate. If any are left they increase at a rapid rate as soon as heat is applied. Thoroughly cleanse the walls, especially behind the pipes, where it is most troublesome to get at, and, finally, with a stiff brush wash the wall with a mixture of lime, sulphur, and paraffin. This having been done, the vines should be tied in position, with the tops bent down to equalise the flow of sap and ensure the growth being regular throughout the canes. Assuming the border is in fair condition, about an inch of good loam, with a mixture of bonemeal and some approved fertiliser, should be spread over the surface.

EARLY PEACH HOUSE.—By the time these notes appear it will be necessary to close the house from which the early crop is obtained. The trees should be cleaned, painted, or sprayed with an approved insecticide, and then pruned and tied. In pruning it is a mistake to have the wood crowded. Lay the shoots in at a distance of not less than five inches apart, or the foliage will not have sufficient room to develop. Tie the shoots in straight as possible from the base to the apex. Use fairly strong matting, and twist it and cut the ends off neat and tidy, and, above all, make secure the end of the shoot, as it is quite possible that a fruit will be on the extreme end, and will want support.

RIPE GRAPES.—Look over these as often as is necessary, and cut out all decaying berries, as they contaminate the sound ones. Where a good grape room, or any dry room is provided, all grapes should be at once cut, and placed with the end of the laterals in bottles. Cut with as long a stem as possible, and fill the bottles with soft water if obtainable.—W. A. COOK, Leonardslee Gardens, Horsham.

Shrubs Out of Season.—Because we cannot have the outdoor garden as lively with colour in winter as at midsummer is no reason why we should not enjoy the flowers of many hardy plants indoors at this season. Shrubs are most important subjects, and extremely easy to manage, once their requirements are understood, but to have them in flower at Christmas necessitates the use of retarded plants, as these respond more evenly to artificial conditions. Even up till the end of Janaary retarded plants are most economical to use, as they are most certain in results, and invariably give a good crop of flowers. Much may be done with home supplies to brighten indoor apartments during winter, and so maintain interest among the flowers, but in this, as other branches of gardening, early preparation is necessary to obtain the requisite number of plants, potting them up, and selecting the earliest and best ripened subjects for the first display.—THOMAS SMITH.

A NEW MEDAL OF HONOUR TO HORTICULTURISTS.

An important event in the horticultural world of America during the past year was the establishment of the George Robert White Medal of Honour for the maintenance of which a suitable fund has been given to the Massachusetts Horticultural Society, and the medal is to be awarded by the executive management of that organisation. Mr. George Robert White, of Boston, in his deed of trust accompanying the fund, states that he has long thought that there was an opportunity for broadening the field of influence of the Massachusetts Horticultural Society, and of extending the interest in its work if some suitable recognition were made of those persons who have accomplished important results in horticulture; the award to be made independently of or in addition to any prizes or certificates of merit that may be bestowed by the society in the course of its regular schedule of premiums.

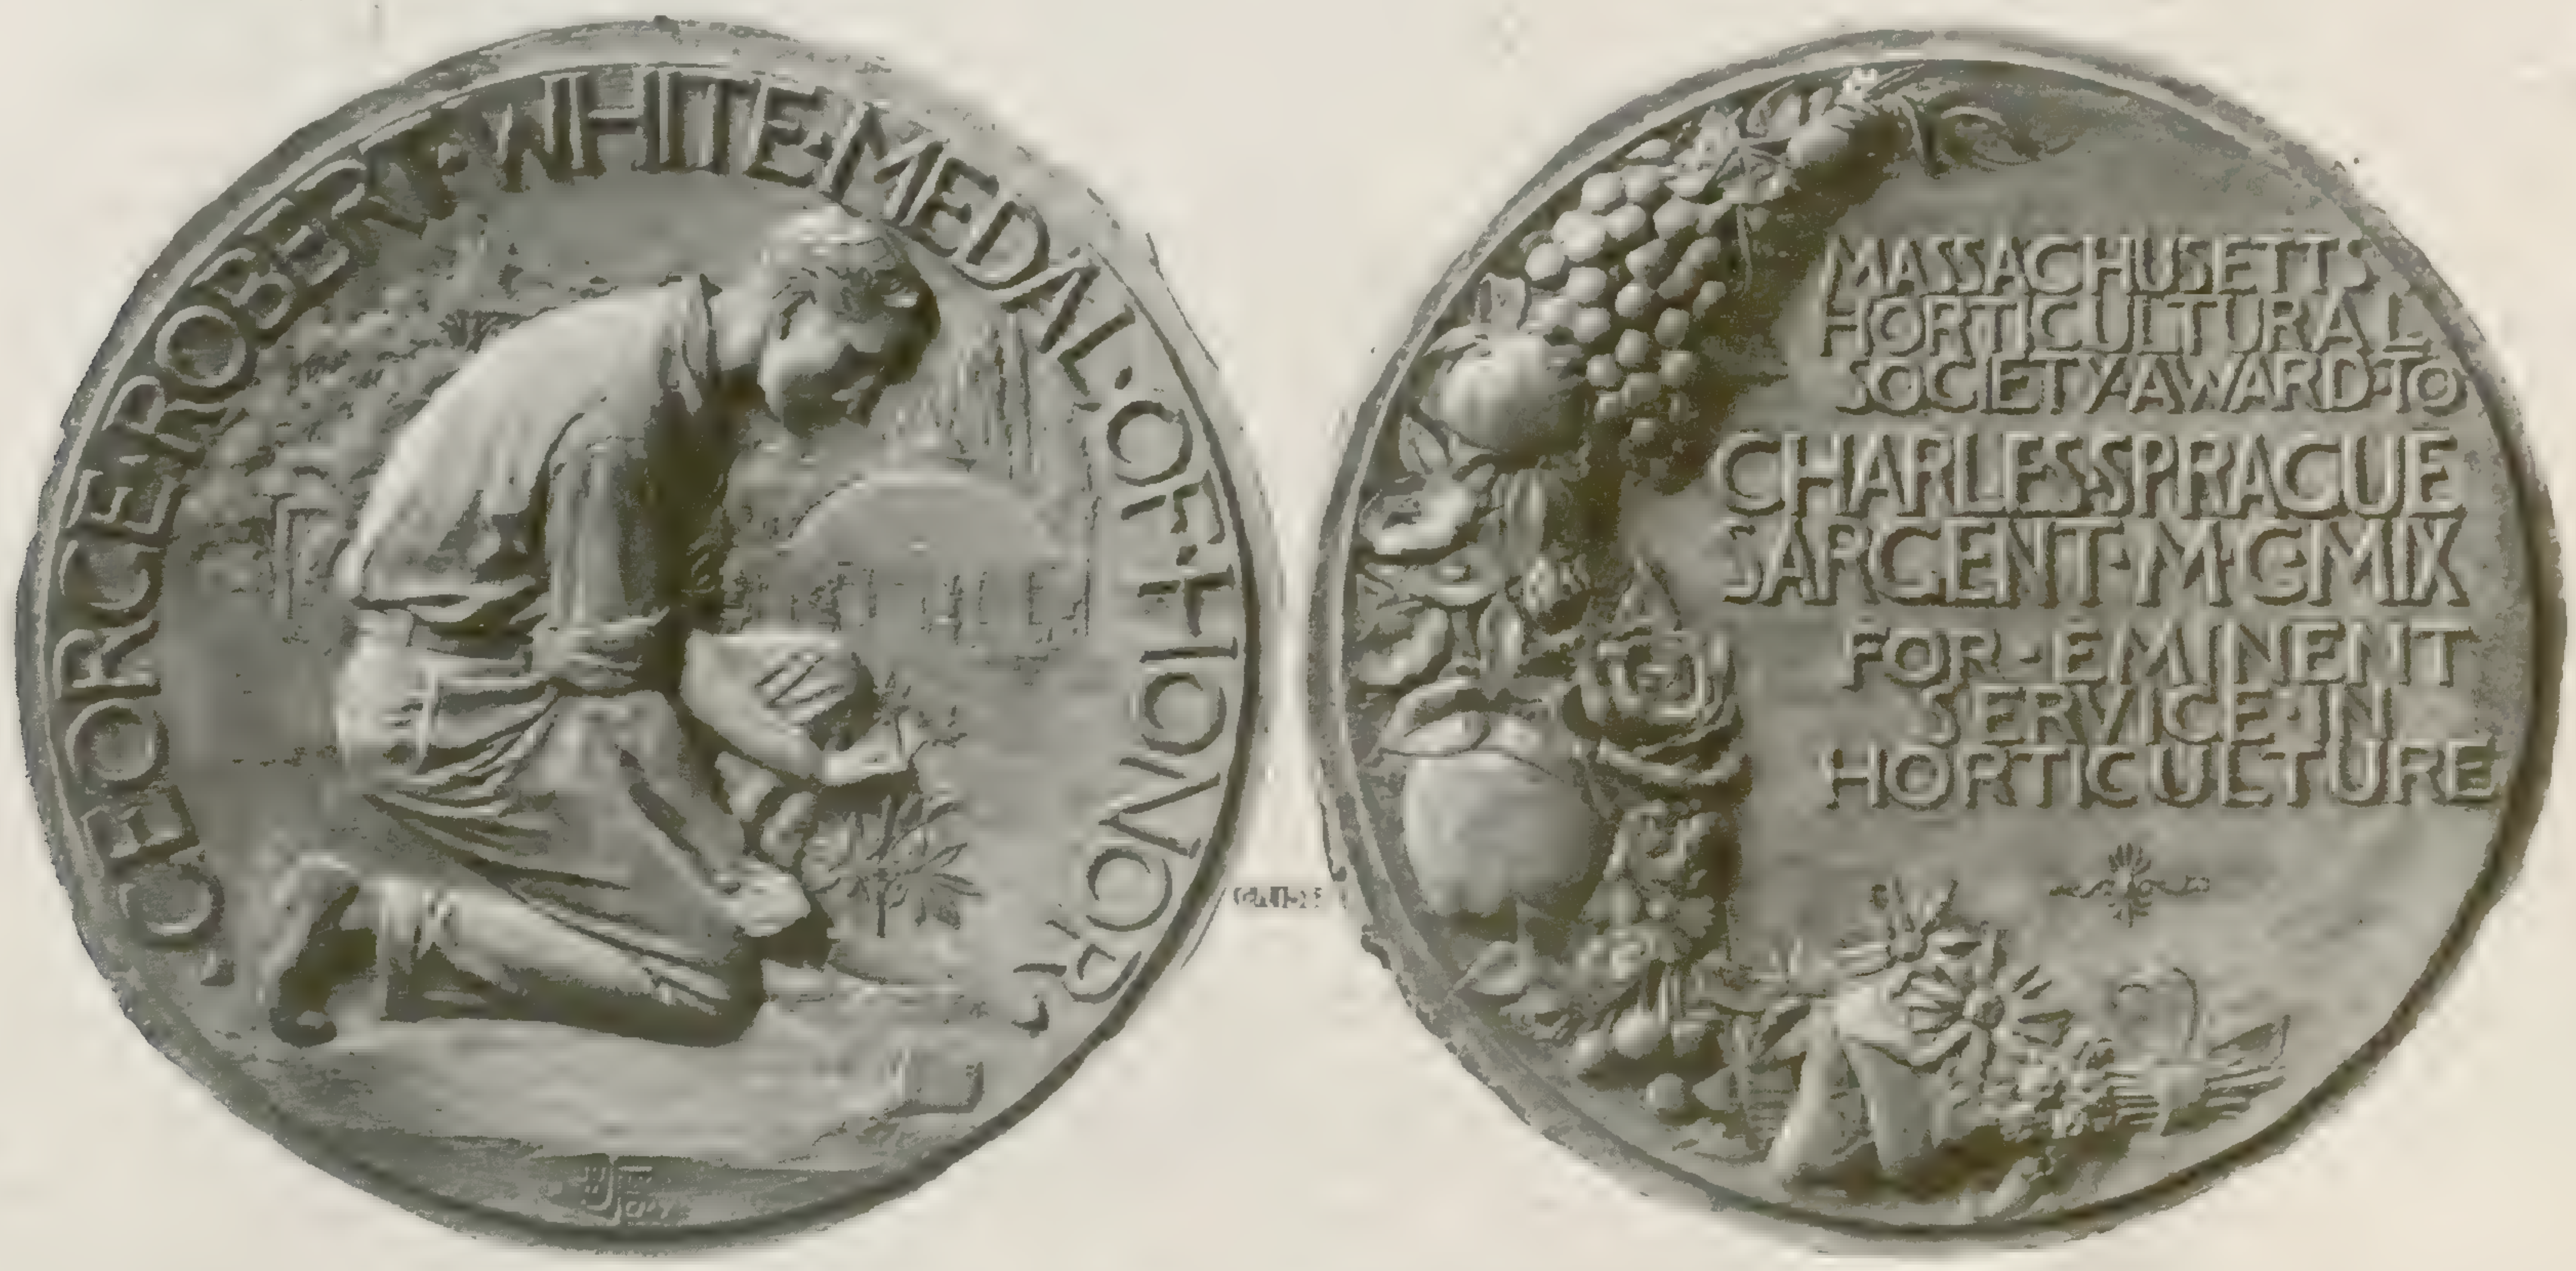
He has therefore founded the George Robert White Medal of Honour Fund, the income of which is to be devoted annually for the specific purpose of providing a substantial gold medal to be awarded to the man or woman, commercial firm or institution, that has done the most during the year or in recent years to advance the interest in horticulture in its broadest sense. While the medal is intended principally to recognise work done by a resident of the United States in advancing the interest in horticulture, it may be awarded to a person, commercial firm, or institution of some other country, the results of whose work in horticulture may be of direct benefit to the horticultural interests in the United States.

The first award of the medal has just been made to Professor Charles S. Sargent, director of the Arnold Arboretum, whose eminent service in horticulture is generally recognised both in the United States and abroad. His great work has been the introduction of many desirable ornamental trees and shrubs, and the testing of their hardiness in New England.

The George Robert White Medal of Honour will take rank in its own field with other medals offered by scientific institutions in recognition of important results attained, and it is expected that it will have a strong influence in promoting the horticultural activities of the United States. The medal, which is illustrated herewith, was struck at the United States Mint in Philadelphia, from twenty-four carat gold; is two and three-fourths inches in diameter, five thirty-seconds of an inch thick, and weighs between seven and eight ounces.

On the face, the figure symbolises, not so much the ordinary horticulturist as the scientific intellect, whose aim is to improve nature. The trees in the background represent the allied branch of arboriculture. On the reverse, in the inscription, the name is so designed that it can be replaced by another name each time the medal is awarded.

The George Robert White Medal was executed by Mr. John Flanagan, a native of Newark, N.J., and a student, first of Augustus St. Gaudens, later, in Paris, at the Academy Julien under Chapu, and the Atelier Falguiere, at the Ecole des Beaux Arts. During the course of these years of study Mr. Flanagan was awarded many prizes, and acted as an assistant to MacMonnies on his fountain for the Chicago World's Fair in 1893. Since then, he has received commissions for many medals, portrait busts, and other works. Several of Mr. Flanagan's medals have been acquired by the Musée du Luxembourg, the Metropolitan Museum, New York, and recently by the Museum of Fine Arts at Ghent.



GEORGE ROBERT WHITE MEDAL OF HONOR
MASSACHUSETTS HORTICULTURAL SOCIETY AWARD TO CHARLES SPRAGUE SARGENT MCMIX FOR EMINENT SERVICE IN HORTICULTURE

THE GEORGE ROBERT WHITE MEDAL OF HONOUR.
Awarded to Professor C. S. Sargent by the Massachusetts Horticultural Society.

COLOUR CHARTS.

The recent remarks by Mr. Harman Payne on "The Repertoire des Coleurs," will be echoed by all who have given this work a practical test. Even when using it in the quiet of the study the loose leaves and the consequent chances of their transposition make it extremely inconvenient.

A colour chart, which I have found very useful in field work, is the "Code des Coleurs," of Klingksieck and Valette. This chart was published to meet the needs of students of fungi, and is constructed on a plan which renders possible very quick reference. Standard colours are taken, and are arranged spectrum-wise from red to deep violet. On the two pages presented wherever the book may be opened, one standard tint is shown at the top left-hand corner on a small slip, roughly one inch by ¾-inch. Let us assume we commence with the pure red. Ranging in the horizontal line the same colour is shown on identical slips, but darkened with a definite amount of a black pigment. This gives, of course, the same effect as a strong concentration of the pigment shown in the standard tint. Four darkened slips are thus shown. The perpendicular line under the standard colour slip is a dilution of the original colour, ½, ¼, ⅛, etc.; four of these are also given. Under each of the darkened slips on the top line are similar dilutions, but the black pigment added makes them, of course, very sensibly different from the weaker edition of the standard colour.

This process is followed on the next page with a standard tint with slightly more yellow in it, and so on till orange, yellow, green, ultramarine, etc., are given. Twenty-three standard tints are shown, this, of course, being equivalent to dividing the spectrum into a similar number of parts, and with the various dilutions and darkening, there are some 720 different colours.

To sum up, the advantages of the "Code" over the "Repertoire" are as follows:

1. A small 8vo. book, which will go into the pocket.

2. Colours found instantly.

3. Slips being pasted on page are always in the same space.

4. The colours represent a nearer approach to the conditions of natural pigments. For instance, the red pigment (authocyan) of Sweet Peas is found in varying states of dilution and concentration from the lightest pink to dark chocolate. This is well imitated by dilution and addition of black (giving the effect of concentration of pigment by reason of greater light absorption), and it is thus shown that many varying colours can be produced by the same pigment.

5. A great advantage is that no attempt is made to name the colours, so the difficulty which occurs, when half a dozen people all have their own (and different) ideas of what a colour name should represent, is avoided. The tints are referred to by number only.

Its disadvantages are:

1. A rather small colour surface, as compared with the "Repertoire."

2. A lack of the many varying lilac, rose, and pale mauves which are met so often in flowers. This could probably be remedied, and the "Repertoire," though greatly ahead in this respect, is not entirely above this charge. The writer, in colour-naming rhododendrons and azaleas, has found many natural tints beyond its resources.

Should any revision or adaptation of the "Repertoire" be undertaken, it would be regrettable if the advantages of its rival were not considered, and the good points of both, so far as possible, combined.

EDWARD A. BUNYARD.

TRADE NOTE.

Mr. A. Hassall, trading as Stanley and Co., orchid growers, Southgate, London, N., informs us that in future the firm will be known as Hassall and Co., late Stanley and Co., and also that Mr. H. Stanley left the firm on Dec. 19, and that Mr. John Cowan, jun., will take over the management on the 23rd inst.

ROSA PERNETIANA I.

Let no one for one moment imagine that Rosa Pernetiana has anything to do with a new botanical rose species recently discovered, say, in China or Thibet, although one must confess the name suggests such inference. Not at all. It refers to a new class of perpetual-flowering hybrids, as distinguished from the hybrid perpetual, hybrid tea, and tea-scented varieties. For some time efforts have been made by hybridists, but hitherto unsuccessfully, to bring the influence of Rosa lutea to bear upon perpetual-flowering roses in general in order to produce a hardy yellow rose. By Rosa lutea we mean such roses as Austrian Yellow, Austrian Copper, and their hybrids, Harrisoni, and Persian Yellow. At last the hybrid was obtained, and just ten years ago a new rose was presented to the rose world by Monsieur Pernet-Ducher, of Lyons, called Soleil d'Or.

But Soleil d'Or came out in advance of public taste. Ten years ago no new rose had much of a chance of an immediate and favourable reception unless it was one of the so-called "exhibition roses" or a pillar variety. Soleil d'Or was neither. It is true that it possessed a shade of colour hitherto unobtainable among the perpetuals, but lacking the currently accepted qualification of a good rose in form and size, and not being very free flowering. Whilst it interested the few it failed to captivate the many. Since it was not useful for purposes of exhibition, nor specially adapted for bedding purposes, it was regarded solely as a novelty in colouring.

Not so the raiser; he realised it as a step in the right direction; he, as did others, saw in it possibilities as the progenitor of a new race, a new break, which he describes in the following terms:

"Pernet Roses, 'Rosa Pernetiana,' perpetual-flowering. This new family of roses is the result of a cross between 'Persian Yellow' (Rosa lutea) and 'Antoine Ducher' (hybrid tea). We were fortunate in being able to create this entirely distinct class, which we have named after our firm, 'Rosa Pernetiana.' It retains somewhat of the character of Rosa lutea, the wood being reddish, but the foliage of a deep green, is a great improvement on that of the parent."

It is not the first time, be it remembered, that a new class of roses has borne the name of its originator. The noisette rose was said to be obtained by Monsieur Philippe Noisette in 1817 by crossing Rosa muscosa with the common Blush China. From this other varieties were produced, hardy and vigorous. Most of them have now dropped out of cultivation, but Aimée Vibert, sent out by M. Vibert in 1828, still remains. Later on the noisette was crossed with tea-scented varieties, which gave us Lamarque in 1830; Ophirie, 1841; Celine Forestier, 1858. These three retain the characteristic arrangement of the clusters of blooms on the stem to be seen in the original species, where the flowers are produced in corymbs. As time advanced the influence of the tea-scented parent has preponderated over the musk, the number of flowers on each corymb has consequently decreased, and it is now difficult to detect the difference between the tea and the noisette. Nevertheless, the nomenclature remains, and the National Rose Society, with other kindred societies, allots a section of the exhibition schedules to "tea and noisette."

Now history repeats itself. As in the early years of the nineteenth century a new race of roses was called "noisette," after the name of its originator, so now in the beginning of the twentieth century another race of roses is springing up bearing the name of its originator, M. Pernet-Ducher, in the term Rosa Pernetiana.

If it were a question of one or two varieties only the distinctive name might be disregarded. It was so at first when hybrid teas came in, and when, at that time the term and distinction met with great opposition, but the force of circumstances was too much for those who desired to class them as hybrid perpetuals. Now the hybrid teas class is the predominant partner in the family of perpetual roses, and one ventures to think that in like manner Rosa Pernetiana will before long be recognised; in the next edition of the catalogue of roses issued by the National Rose Society we shall expect to see these roses in a class by themselves, and what was done for M. Philippe Noisette will likewise be done for M. Pernet-Ducher.

Of some of the roses of the Pernetiana group we may have more to say later on, but as an example of how other raisers are following on the lines laid down by M. Pernet-Ducher we may point to the new rose Juliet, raised by Messrs. William Paul and Son, an illustration of which appears in the GARDENERS' MAGAZINE Almanack for 1911. Juliet is a strong-growing and apparently hardy variety, bearing certain characteristics of Rosa lutea, especially in the prickles. The flowers are of medium size, cupped, petals soft yellow suffused with rosy-red, foliage dark green.

JOSEPH H. PEMBERTON.

NEW TREES AND SHRUBS.

Public attention in trees and shrubs has within the last few years been greatly stimulated by the number of species and varieties that have been introduced, many of which have been already put into commerce. Of late the most successful hunting ground has been Central and Western China, where, in 1899, Mr. E. H. Wilson went collecting on behalf of Messrs. Veitch. Some of his earlier introductions are already exceedingly popular, while others are, from their slow rate of increase, not yet sent out. In a subsequent journey, in which the Hon. Vicary Gibbs and Professor Sargent were interested, Mr. Wilson sent home a number of good things, and he is now in China at the expense of the Harvard University. Many of his introductions have already proved their worth in the Arnold Arboretum, whose director, Professor Sargent, has an unrivalled knowledge of the trees and shrubs of the Far East, as well as those of the Western continent.

In reviewing these new Chinese trees and shrubs it is necessary to mention that a prominent feature is the number of new genera that occur among them, while some popular classes have received great acquisitions. This is, among others, particularly noticeable in the case of the rhododendrons, of which, till within the last decade or so, comparatively few species were known. Now those recognised by botanists are very numerous, and some are of high ornamental value. This is shown by the fact that in 1907 Rhododendron nigro-punctatum, afterwards changed to R. intricatum, was given a First Class Certificate by the Royal Horticultural Society, and the dwarf-growing, yet large-flowered Rhododendron Souliei gained a similar distinction in 1909. In 1910 an Award of Merit was given to Rhododendron primulinum.

The viburnums of recent introduction are also very numerous. One of the most notable is Viburnum rhytidophyllum, a very attractive and most distinct evergreen, but having been so freely distributed within the last two or three years it is perhaps a little out of place to refer to it as a new shrub. Viburnum Henryi, given a First Class Certificate on September 27, 1910, is a choice evergreen shrub with lanceolate leaves of a bright glossy green colour, and panicles of white flowers, which are succeeded by berries, bright coral-red when ripe. Other species are V. phlebotrichum, a large-growing shrub, somewhat after the manner of our native V. opulus, and, like it, bears a profusion of scarlet fruits in autumn. Viburnum theiferum is somewhat in the same way, while the evergreen V. utile is decidedly promising as a white-flowered shrub in spring, but at present its merits in this respect have not been fully tested.

Barberris are also freely represented among these Chinese introductions, but though pretty and interesting, it is questionable if, with one exception, any of them will prove of very high ornamental value. This exception is Berberis Wilsonæ, a dwarf-growing shrub, with golden flowers and a profusion of coral-red berries, while the decaying leaves are also richly coloured. Other interesting species are B. Gagnepaini, an evergreen shrub with blackish berries; B. polyantha, a bold-growing deciduous kind, with drooping clusters of roundish red berries; and B. brevipaniculata, remarkable for its glaucescent character. The Chinese region would appear to abound with cotoneasters, for we have had several introduced of late years. Among them are C. applanata, a curious growing shrub with scarlet berries; C. humifusa, quite a trailing little evergreen; C. rugosa Henryi, with curious drooping foliage; and C. reflexa, with a profusion of white berries in spring.

Space does not admit of enumerating in detail the other different flowering shrubs that we have received from China within recent years, but included among them are buddleias, deutzias, spiræas, clematis, loniceras, etc., while of evergreens mention must be made of the delightful little Ilex Pernyi, which has been figured in the GARDENERS' MAGAZINE; Pinus Armandi, one of the Cembra section; Sarcococca ruscifolia, a butcher's broom-like shrub with shining green leaves; Ligustrum Henryi, given an Award of Merit on October 11, 1910, a neat evergreen bush with glossy dark green ovate leaves; Magnolia Delavayi, a promising species with large creamy-white flowers; Stranvæsia undulata, nearly related to the photinias; and Sycopsis sinensis, a neat evergreen, and the only hardy member of the genus.

The new Chinese trees are, of course, not so much in evidence as the shrubs, as they take so much longer to develop their character and show their worth. Perhaps one of the most remarkable of all is Davidia involucrata, the showy portion of whose inflorescence consists of large white bracts, which form a marked contrast to the dark green of the lime-like leaves, but up to the present it has not, as far as I know, flowered in this country. Populus lasiocarpa, with its huge heart-shaped leaves veined with red, has already gained many admirers. Other trees that may be looked upon as yet in the probationary stage are the Chinese Tulip Tree (Liriodendron chinense), which bears smaller flowers than its North American relative; Decaisnea Fargesi, a deciduous tree with handsome pinnate leaves and greenish-yellow flowers,

HAVE YOU GOT A SEED SOWING TIME TABLE?

It would be just as useful to you when you want to sow seeds as a railway time table is when you want to catch a train, and would help you to make sure of sowing your seeds at the proper time to ensure

THE BEST POSSIBLE RESULTS.

It would also enable you to have your plants in bloom or your vegetables ready for table just when wanted. If you are an exhibitor it would tell you the correct time to sow in order to have your produce in the best possible condition for the show. So far as we know, Stormonths' Catalogue of

WARRANTED BEAU-IDEAL SEEDS IN 1d. PACKETS

is the only reliable source whence this information may be obtained. A copy will be sent, post free, on receipt of your name and address on a postcard.

STORMONTHS,

THE VERY KEYSTONE OF THE MOST SUCCESSFUL CULTURE.

Sold in Tins at 6d. and 1/-: in Bags, 7 lbs., 2/6; 14 lbs., 4/6; 28 lbs., 7/6; 56 lbs., 12/6; 1 cwt., 20/-.

Nitric Diet is a **complete** Manure; prepared only by

R. J. BARNES & SON, Malvern,

who also supply Pure Bone-Meals, Crushed Bones, Steamed Bone Flour, Unadulterated Fish Guanos, and every other Fertilizer of known value.

these latter being succeeded by pendulous fruits, which, when ripe, are of a pleasing blue colour; Tilia Oliveri, whose heart-shaped leaves are clothed underneath with a whitish tomentum; acers of different kinds; a paulownia; Tetracentron sinense, a large tree somewhat like Cercidiphyllum japonicum, and Carrieria calycina, a deciduous tree with bluish-white flowers.

So much space has been taken up with even these imperfect notes on Chinese trees and shrubs that but little space remains for the new kinds which we owe to the hybridist's skill. A delightful broom is Cytisus Dallimorei, with reddish-purple flowers. It is a seedling from Cytisus Andreanus pollinated with C. albus. M. Lemoine, of Nancy, still continues to raise new lilacs, deutzias, and philadelphuses. Among these last is one variety, Œil de Pourpre, which is described as having the white flowers marked in the centre with blackish-purple. It is thus an addition to the purpureo-maculatus type, and should be of much value. W. T.

Escallonia Langleyensis.—Intending planters will do well to take a note of this, one of the most beautiful of all the escallonias. It is of hybrid origin, and was obtained by crossing the white-flowered Escallonia Philippiana with the deepest-coloured form of Escallonia macrantha. It inherits the hardiness of its first-named parent, and is, in many respects, intermediate between the two kinds. Escallonia Langleyensis is of a spreading, semi-scandent habit of growth, and is seen to great advantage when the main branches are secured to stout upright stakes, leaving the minor ones to dispose themselves at will. The flowers are of a bright carmine-rose colour, and borne in great profusion about midsummer.—W. T.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibition at Vincent Square on January 3 was a smaller one than usual, and there was only a moderate attendance. Orchids, especially cypripediums, were very much to the front, and begonias, carnations, and cyclamens were other prominent subjects.

FLORAL COMMITTEE.

A splendid lot of finely-grown cyclamen were brought all the way from Etwall, Derby, by the Rev. H. Buckston. The ordinary forms were good, but the chief attraction lay in the papilio forms, which have been largely improved and reproduced true to colour. One of these, a charming salmon-pink, with rich crimson centre, was a lovely variety, and it had flowers over three inches across, prettily frilled, and with the segments charmingly fimbriated; this variety gained an A.M. Some of the flowers were very double in appearance owing to the frilling. Mr. G. Reuthe, Keston, showed Hamamelis Zuccarini, Berberis Bealei, Helleborus lividus, pernettyas, saxifragas, hardy cyclamens and primulas. Phœnix Roebelini was well shown by Messrs. William Cutbush and Son, Highgate, this firm contributing attractive groups of Iris Bakeriana, I. histrioides major, I. alata, Helleborus niger, and perpetual carnations, the latter shown in large numbers.

Very bright were the cut pelargoniums so finely staged by Messrs. H. Cannell and Sons, Swanley; Arabic, Saxonia, Umbria, Lucania, Jupiter, Carmania, and Hibernia were strikingly brilliant and shapely varieties. The camellias, cut flowers, and small bushes sent up by Messrs. William Paul and Son, Waltham Cross, proved very interesting, and the single and semi-double varieties Vesta, Apollo, Tricolor, Mars, Minerva, and Tokayana was a great attraction. A collection of veronicas and heaths from the Guildford Hardy Plant Company was another interesting contribution. Moschosma riparia, Indian azaleas, Gesnera Aurora, a set of their winter-flowering begonias, the new variety of B. Gloire de Lorraine, named Mrs. Bedford, and a few plants of Buddleia officinalis were staged by Messrs. James Veitch and Sons. Cyclamens, daphnes, and some charming perpetual carnations, in goodly numbers and the best varieties. Cyrtomium Rochfordi, the fimbriated form of C. falcatum, was again shown well by Messrs. Thomas Rochford and Sons, Broxbourne, who had also on view their fine and persistent variety of Begonia Gloire de Lorraine, named Amabilis.

Carnation White House was well represented by Messrs. W. Wells and Co., Earlswood. Messrs. H. B. May and Sons, Edmonton, contributed a display of the newer ferns, especially the better and plumose forms of nephrolepis, Adiantum Fergussoni, and Davallia tenuifolia Veitchi. Mr. L. R. Russell, Richmond, showed a collection of attractive ivies, eleagnuses, etc.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, exhibited a few plants only, but all were good ones: there were Odontioda Charlesworthi, Odontoglossum crispum var. xanthotes, O. Aireworth (crispum and Lambeauianum), Cypripedium Priam, very fine; Lælio-cattleya Artemus, rich orange-gold;

An interesting group was provided by Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Christchurch Road, Streatham. The larger part of the exhibit consisted of young flowering plants of cattleya hybrids. Other good

Eckford's
SWEET PEAS

SWEET PEA PERFECTION.

A flower garden without Eckford's Sweet Peas can only be compared to a house without furniture.

Sweet Peas are requisite to the small, medium, or large garden, and if you wish to have colour, effect, prize specimens, and tall plants, then send to Eckford's for your seeds.

The time to buy is NOW. The firm to buy from is Eckford's. No other seed specialist in the world can rival Eckford's for Sweet Peas.

Larger flowers, longer stems, brighter colours, and a profusion of bloom is the result of growing Eckford's seeds.

Remember, Genuine Eckford's Seeds can only be obtained direct from Wem. No Agents are employed.

A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction.

SPECIAL NOVELTY OFFER FOR 1911.

LUMINOSA.—This variety will be appreciated for its deep coral colour, which for decoration is unexcelled, having the quality of giving off greater brilliance in artificial light than any other variety. Very scarce. In sealed packets, [illegible] seeds, **3d.**; [illegible], **1s.**

VICOMTE DE JANZE. A fine bold flower of exquisite shape, the standard being splendidly erect; in colour it is deep bright rose, perfectly distinct, a charming flower. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

DODWELL F. BROWNE (WAVED).—This is a very beautiful intense bright crimson, three and four flowered, almost a self; a true Giant Waved variety of intense King Edward VII. colour. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SAINT GEORGE.—Light orange pink standard with slightly lighter wings; almost a self; good sizes; slightly waved. In sealed packets, 20 seeds, **3d.**; 40, **6d.**; 80, **1s.**

ASTA OHN (WAVED).—A pretty waved lavender overlaid with rose; a very charming flower of good size and substance. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MAGGIE GERRING.—This is a decided acquisition with a bold standard of perfect shape, and beautifully balanced wings. In colour it is a soft cream overlaid with a delightful shade of pink which rather deepens towards the edges. It is exquisitely rich in tone when bunched. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

APPLE BLOSSOM (WAVED).—This, as its name implies, is a beautiful flower of apple blossom colour, of giant size, and, like most of the waved varieties, is a very strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. E. GILMAN.—A fine bold flower, with expanded standard. It has a creamy ground suffused with bright rose, and almost pure cream wings. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

PICOTEE (WAVED).—This is one of the very finest introductions, being a giant waved flower, pure white, with a beautiful picotee edge of carmine; in most cases the flowers are borne in fours on a long, strong stem. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

EVELYN HEMUS (WAVED).—A warm cream, shading to yellow, with a picotee edge of terra-cotta pink; of great size and refinement; standard and wings beautifully waved, and nearly always four-flowered. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. HENRY BELL (WAVED).—A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MID BLUE.—A medium-sized erect flower of deep sky blue. It is a strong grower, very free, and frequently four flowered, quite distinct. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

OTHELLO (WAVED).—A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s**

CERISE (WAVED).—A fine, bold, beautifully waved, true cerise, a very strong grower, giving generally four flowers on long, strong stems. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SPECIAL OFFER. One full-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **12 6** post free for cash with order.
One half-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **6 6** post free for cash with order.

SPECIAL COLLECTIONS FOR 1911.

Villa (A) Collection. [illegible] very choice varieties, suitable for villa garden, excellent giant flowered sorts, most suitable for cutting and exhibition, 25 seeds of each, **10s.**

Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s. 6d.**

Half-Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 25 seeds of each, **3s.**, post free for cash

FREE. Send a postcard to-day for large illustrated and coloured catalogue: It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

Finsbury Square, London, E.C.

things were Odontioda Charlesworthi and Sophro-lælia Saxa.

Lælia anceps in variety was presented by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, who also staged a number of cypripediums, Cymbidium insigne, C. Traceyanum, C. Wiganianum, Oncidium varicosum Rogersi, O. bicallosum, O. crispum, O. raniferum, Odontioda Charlesworthi, Renanthera Imschootiana, and some odontoglossums.

Messrs. James Veitch and Sons, Chelsea, showed a collection of cypripediums, the hybrids and varieties being represented by well-grown plants: C. insigne Harefield Hall, C. Lathamianum, C. Hera Euryades, C. Actæus, C. Ville de Paris, C. Clionea, C. Elatior, and C. Thalia were a few of the good things. Lælio-cattleya Cranstounæ Westonbirt var., a hybrid between C. Harrisonæ and Lælia tenebrosa Walton Grange variety was shown from Westonbirt—it carried six big creamy flowers, with a purple-marked lip—a striking subject from such parentage. Mr. Alexander, Lt.-Colonel Sir G. Holford's able grower, also showed Cypripedium Nydia in good form. Messrs. James Cypher and Sons, Cheltenham, contributed a group of very finely-grown cypripediums, the flowers being of excellent size; here were C. Beekmanni, C. Alcibiades superbum, C. triumphans, C. Mr. F. Sander, C. Mrs. Mostyn, C. William Lloyd, C. Charlesianum, C. Fascinator, C. Curtmani, and C. Leeanum Chardwar var.; there were also a few masdevallias and calanthes from Cheltenham. Mr. M. Mertens, Ghent, showed a few very attractive, unnamed hybrid odontoglossums. Cypripedium Riordan, very bold; C. Cupid, and C. Miss Alice Wallace were shown by Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking. Cypripedium Goliath, of unknown parentage and of large size, as its name suggests, was submitted by Messrs. Sander and Sons, St. Albans.

LÆLIO-CATTLEYA CRANSTONÆ WESTONBIRT VARIETY.

A distinct and beautiful variety, bearing medium-sized flowers; the sepals and petals pale yellow, and the lip white marked with purple. A.M., R.H.S., January 3. Lieut.-Colonel Sir George Holford.

Right across the top of the hall Messrs. Armstrong and Brown, Tunbridge Wells, arranged a very fine collection of cypripediums; there were altogether several hundred plants, set in a sloping bank among maidenhair ferns. It was a rare display of long-lasting winter-flowering orchids, and finely demonstrated the usefulness of these flowers. C. insigne was represented by the varieties Chantini, Lindeni, Cobbianum, Orchidhurst var., Dormani, Sanderæ, Berryanum, Sanderianum, Aberdeen, Amesiæ, Monarch, Jas. Renwick, and Harefield Hall. There were numerous varieties of the useful C. Leeanum and C. nitens, while C. Zeno, C. triumphans, C. aureum, C. Niobe Westonbirt var., C. Arthurianum Charlesworth's var., C. The Sultan, C. Beekmani, C. Thalia Mrs. Francis Wellesley, C. Mrs. Mostyn, C. King Edward VII., C. Dauphine, C Venus, C. Helen II. var. Armstrongæ, a lovely thing; C. Fascinator, C. Actæus, C. Hitchinsæ, etc. The range of insigne varieties and hybrids from that species was wonderful, and all through the plants were finely grown, and the flowers large and bright. The display was a splendid one, and gave evidence, among other things, of the resources of this Tunbridge Wells firm.

Goodson's variety of Odontoglossum Wiganianum, with bright yellow-green colouring, was shewn by Mr. H. S. Goodson, Fairlawn, Putney. From Glebelands, South Woodford, Mr. Davis, gardener to J. Gurney Fowler, Esq., brought up Cypripedium Leeanum J. Gurney Fowler, a big flower; C. chrysotoxum Victor, a fine plant with nine flowers, and Cymbidium Glebelandense, a curious cross between C. Schroderianum and C. insigne Glebelands var.

FRUIT AND VEGETABLE COMMITTEE.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, gained a silver Hogg medal for an exhibit of Muscat of Alexandria, Appley Towers, and Alicante grapes, fourteen bunches in all. Mr. Goodacre also showed Elvaston Winter and Selected Sunbeam tomatoes. Mr. Wm. Poupart, Twickenham, put up a beautiful lot of bottled fruits, chiefly plums, in grand condition.

Mr. Gentle, gardener to Mrs. Dennison, Little Gaddesden, showed that his hand has not lost its cunning in connection with onion growing, for he staged grand bulbs of Carter's Record, Ailsa Craig, White Spanish, and Holborn varieties. Christmas and New Year vegetables from Messrs. Sutton and Sons, Reading, were a further attraction, and they included Sutton's New Year savoy, Christmas Salad chicory, and Christmas White broccoli, the latter represented by about four dozen beautiful heads.

A collection of apples from Messrs. J. Peed and Son, West Norwood, S.E., was interesting, and the bright fruits of Annie Elizabeth, Lewis's Incomparable, Tyler's Kernel, Hollandbury, Hoary Morning, Betty Geeson, Queen, Emperor Alexander, and Dumelow's Seedling. Mr. W. E. Sands, Hillsborough, co. Down, Ireland, showed potatoes grown as a catch crop; they were planted at the end of June, 1910, following a crop of either early potatoes or cabbage, and were the fourth crop taken from the land in two years, the sample was fairly good, especially considering the circumstances.

AWARDS.

No certificates were granted on this occasion.

Award of Merit.—To Cyclamen Mrs. Buckston, from Rev. H. Buckston, Etwall, Derby; to Odontioda Cooksoniæ, from J. Gurney Fowler, Esq., Glebelands, South Woodford; and to Lælio-cattleya Cranstounæ Westonbirt var., from Lt.-Colonel Sir G. Holford (grower Mr. H. Alexander), Westonbirt, Gloucester.

MEDALS.

Gold.—To Messrs. Armstrong and Brown, Tunbridge Wells, for cypripediums.

Silver-gilt Flora Medal.—To R. G. Thwaites, Esq., Streatham Hill, for orchids.

Silver Flora.—To Rev. H. Buckston, Etwall, Derby, for cyclamens; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. James Cypher and Sons, Cheltenham, for orchids; to Messrs. W. Cutbush and Son, Highgate, for carnations, etc.

Silver-gilt Knightian.—To Mr. Gentle, gardener to Mrs. Dennison, Little Gaddesden, Herts, for onions.

Silver Hogg.—To Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, for grapes.

Silver Knightian.—To Messrs. J. Peed and Sons, West Norwood, for collection of apples.

Silver Banksian.—To Messrs. Sutton and Sons, Reading, for vegetables; to Messrs. James Veitch and Sons, Chelsea, for orchids; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Messrs. Thomas Rochford and Sons, Broxbourne, for begonias and ferns; to Messrs. James Veitch and Sons, Chelsea, for greenhouse flowering plants; and to Mr. W. E. Sands, Hillsborough, co. Down, for potatoes.

FORTHCOMING ENGAGEMENTS.

MONDAY, January 9.—Leeds Gardeners' Association, lecture, "Recent Work in Soil Fertility," by Professor Galt.
MONDAY, January 16.—Royal Horticultural Society. Examination of Employees in Public Parks.
TUESDAY, January 17.—Royal Horticultural Society. Meeting of Floral, Fruit, and Orchid Committees, 12 noon; General Meeting, 3 p.m.; Lecture by Mr. H. C. Long on "Weeds and Weed Seedlings"; Scientific Committee, 4 p.m.
THURSDAY, January 19.—Linnean Society, 8 p.m.
SATURDAY, January 21.—Société Française d'Horticulture de Londres, Annual Dinner, 6.30 p.m.
British Gardeners' Association, Meeting at Cobden Café, Corporation Street, Birmingham, 7.30 p.m.

Pernettyas.—From the ornamental qualities of their fruits, either out of doors or in the greenhouse, the different forms of Pernettya mucronata are very beautiful. In the open ground it should be borne in mind that the conditions favourable to many ericaceous plants, such as azaleas and rhododendrons, are equally suitable to the pernettyas, these last being members of the same order. The roots are, as in many of their allies, of a dense fibrous nature, owing to which the berried plants may be lifted with but little check, and potted for greenhouse decoration. Under these conditions the fruits will remain fresh and bright for a considerable time.—W. T.

ANSWERS TO CORRESPONDENTS.

FUNGUS ON GRAPES.—W. H. P., Winscombe: A matter of this kind cannot be decided off-hand; it has to be investigated, and sometimes this occupies a long time, often, indeed, necessitating the culture of the fungus for a sufficient length of time to determine its life history. We are doing our best for you, and any information you can give us as to position of house, cultivation, manuring, etc., will be useful, in prescribing a remedy. Have any signs of attack ever appeared on the leaves on shoots of the vines?

DOUBLE CINERARIAS.—M. S. F. H., Antrim: There are double cinerarias in cultivation, but they are not popular, and consequently not largely grown. They are usually of close habit, and do not possess the elegance of the modern large-flowered single varieties, and their culture offers a little difficulty inasmuch as basal cuttings have to be taken each year to ensure stock for the following season. The flowers sent represent a vigorous semi-double variety, and no doubt you will be able to save seeds from such a plant. If you are satisfied with a fair amount of doubling you will be able to retain freedom of habit and bloom, but the farther the doubling process is carried by selection the fewer will be the seeds ripened and the more compact will the plants become. It is quite possible that there is a fair share of popularity in store for an elegant free race of cinerarias with good semi-double flowers.

LOSS OF BUDS ON GOOSEBERRIES.—H. L., Bristol: The loss of buds on the gooseberry shoots is due to the depredations of birds; in town districts sparrows are a very great plague, robbing both gooseberries and currants of innumerable fruit buds during the winter. The bushes must be made distasteful to the birds, and this can be managed by several means. A slightly adhesive quassia, petroleum, or nicotine mixture will serve, but an easy method is that of dusting the bushes with either lime or soot occasionally while they are damp, always repeating the operation soon after a rainy period.

EARLY CHRYSANTHEMUMS.—D. L. E., Chesterfield: Lift the old stools at once, shake the soil from them, and take care that slugs and worms are not allowed to remain among the roots. Then pot or box up the plants, keeping them carefully labelled, and using a somewhat light compost to which a good dusting of soot or lime is added. After potting place the plants in a frame from which severe frost can be excluded; no heat is necessary, only protection from severe cold, wet, and slugs. In the spring, about March, numerous growths should appear, and these must be removed as soon as large enough, and as most of them will have roots attached they will quickly establish themselves as individual plants if placed in sandy soil in a frame. Meanwhile trench and manure the ground as soon as possible, leaving it rough on the surface.

COST OF PLANTING STRAWBERRIES FOR MARKET SUPPLIES.—A. C. H., Bray: Failing an opportunity of planting in September or October, February and March are the best planting months. In some districts runners can be purchased more cheaply than in others. The cost varies also according to variety and quality, especially layered plants costing from 10s. to 15s. per 1,000, while "runabouts" (ordinary runners), may be bought for 5s. per 1,000. Assuming that there is less waste entailed in the purchase of stocky runners, and that weaklings are often planted in pairs, the average cost of plants per acre is from £4 to £8, 12,500 to 16,000 plants being required for each acre of ground. If planted two feet apart each way, nearly 11,000 plants are required per acre, but the distances between the rows and between the plants in the rows may vary considerably; for instance, rows 30 inches apart, and 12 to 15 inches from plant to plant, are common, while, on the other hand, "Paxtons" and "Nobles" are planted two feet from row to row, and one foot from

*** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

plant to plant, in which case nearly 22,000 plants per acre are required. Some useful varieties of strawberries are: Bedford Champion — a large, handsome, richly-coloured mid-season fruit. In much favour with growers, as the flesh is firm, and the fruit bears packing and travelling well. Givon's Late Prolific—a valuable dark crimson-skinned variety for the last crop. A vigorous and free cropper. Royal Sovereign—a large and early variety, of good flavour; excellent for market and forcing. Sir Joseph Paxton—a large and prolific mid-season variety, having a good flavour and standing packing well. Noble—a large early variety, selling well until others are ready, but soft and bearing packing badly. The Laxton—a large, handsome, oval fruit, having a good flavour, but not packing so well as some varieties.

CLIMBER ON AN OLD TREE.—B. N., Effingham: Numerous climbers are suitable for covering an old and dying tree, but before they are planted it is essential that a place should be prepared for them. The soil at the base of an old tree is usually inert and poor; therefore some of it must be removed and suitable compost be put in its place: a site two feet wide and deep should be prepared, larger if possible. Clematis flammula, C. vitalba, C. montana, and C. Jackmanni are all suitable, while most of the strong-growing roses will be a success provided the tree is not a very high one. Polygonum Baldschuanicum we can strongly recommend for the purpose. Most of the newer ornamental vines, such as Vitis Coignettiæ, V. armata, V. Thunbergi, V. Henryi, etc., will also serve provided floral beauty is not an essential requisite.

AMERICAN CARNATIONS. — J. F. S., Chelmsford: There is an extensive list of names of American varieties of tree or perpetual carnations in "The Carnation Year Book" for 1910 the official publication of the Perpetual Flowering Carnation Society. In this list the names only are given, and the list is as compiled by the American Carnation Society in March, 1909; no descriptions are given, nor are the raisers' names attached.

PUBLIC PARKS EXAMINATION. — M. E. J., Hampstead: The Royal Horticultural Society's "Book of Arrangements" for 1911 has not yet been issued, but we imagine the general principles of the Public Parks Examination for the year will be on similar lines to those of 1910. At any rate it will help you to know that candidates in 1910 were expected to have a knowledge of:—

1. Trenching, digging, and draining; and the purposes of each.
2. Variety of soils and manures; their effect and suitability to various purposes.
3. Grass land: Renovation, turfing, relaying; grass edges; grass under trees.
4. Various methods of propagating trees and shrubs, herbaceous, greenhouse, and subtropical plants.
5. Trees, plants, and shrubs specially suitable for town growth, and their correct nomenclature.
6. The general structure of plants.
7. Such elementary drawing as will assist in the formation of beds and their laying out.
8. Works and estimated expenditure on roads, paths, stonework, rockwork, fences, lakes, bridges, seats, etc.
9. Candidates will also be expected to display evidence of general knowledge and observation and to be able to write an intelligent report on any subject connected with their work.

NAMES OF PLANTS

Tobias, Byfleet.—1, Dendrobium Ainsworthi; 2, Lælia anceps; 3, Oncidium sphacelatum.

TRAINED TREES A SPECIALITY.
CATALOGUE FROM J. R. PEARSON & SONS,
LOWDHAM, NOTTS.

BENTLEY'S Concentrated Alkali.

THE IDEAL WINTER SPRAY.

For Fruit Trees and Forest Trees of every kind.

Destroys **INSECTS** (whether in the active or dormant state), **spores of fungi, lichens, mosses.** Cleanses the bark from **vegetable growths.** Detaches loose and decayed bark, thereby exposing the harbouring places of the insects, and having on these a most deadly effect without injuring the trees.

For Apple, Pear, and Plum Trees, Bush Fruits, and Forest Trees. 1 tin dissolved in 11 gallons of water.

For Apricot, Peach, Nectarine, and Cherry Trees. 1 tin dissolved in 16 gallons of water.

PRICES:—

1 to 8 tins, **1/3** each; 8 tins, **1/2** each; 12 tins, **1/1** each; 20 tins, **11d.** each; 40 tins, **10d.** each.

BENTLEY'S INSECTICIDE.

This valuable **NON-POISONOUS Plant Wash** has for the last thirty years held the highest position in the Horticultural World as a most effectual **Destroyer of all Forms of Filth,** including

MEALY BUG, SCALE, AND THRIP,

without risk to the foliage. It also possesses cleansing properties, and leaves the foliage clean and bright.

PRICES:—

6 galls., **7/6** per gall.; 3 gall., **8/-** per gall.; 1 gall., **9/-**; ½ gall., **5/-**; 1 quart, **3/6**; 1 pint, **2/-**. **Carriage paid on 7/6 orders and upwards to any railway station.**

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

National Sweet Pea Society.

Societies, like individuals, have their periods of prosperity and depression, and usually difficulties that are really of importance arise at a time when apparently everything appears to be in the most satisfactory condition, and from quarters whence they are least likely to be expected. The National Sweet Pea Society is a remarkable proof of this. Founded some ten or eleven years since, this society has enjoyed a very high degree of prosperity, both as regards its finances and its work. Beyond meeting with a few trifling difficulties at an early period in its career, such as are incidental to a young society in a vigorous state of development, nothing has occurred to hinder its progress or to interfere with the pleasure which all who have been responsible for its management must have derived from the splendid results of their strenuous endeavours in the cause of the sweet pea and its cultivation. As in the case of another society devoted to flowers remarkable for their fragrance, the National Sweet Pea Society has—if we may be excused for indulging in metaphor—been sailing in a smooth sea, without a cloud on the horizon, and with sufficient wind to fill its sails and carry it briskly along on its mission of usefulness. There may have been a few discordant sounds in the breeze, but what of them? They were low, and they arose in quarters from which no danger could well have been anticipated. But during the past few weeks a great change has occurred, a cloud has spread itself over the scene, and the good ship has been diverted sufficiently from its pleasant course to render skilful navigation necessary to prevent a serious mishap. Dropping metaphor, and avoiding anything likely to give rise to unnecessary alarm, we feel it desirable to direct the attention of the members of the society to the disastrous results that must follow the failure to rescind the ill-judged instruction relating to the status of the amateur that was passed at the annual meeting. We know not whether the committee has come to any decision as to the course that will be taken should its proposal be rejected; but we assume that the members would take exactly the same course as any other body of high-minded men under similar circumstances. We do not anticipate the rejection of the proposal, but we would remind members that to prevent this happening, with its far-reaching consequences, they should make a point of being present at the general meeting, which, as will be seen from the notice we publish elsewhere in this issue, will be held at the Hotel Windsor on the 18th inst. for the purpose of dealing with the matter. It is difficult to understand the cause of the opposition that has arisen in some quarters to the Floral Committee, which, we venture to assert, has done its work in a manner that is deserving of the highest praise, and has thereby contributed materially to the high position and influence of the National Sweet Pea Society. There has been a little criticism here and there on the Floral Committee and its work, but it is not surprising that disappointment should now and again be felt by raisers, for the committee has been very sparing in its awards to novelties, and it has paid constant attention to the classification of too-much-alike varieties. But it must be remembered that had this work been done less thoroughly the nomenclature of varieties would have been in hopeless confusion, and a serious check would have been imposed upon the sweet pea industry, which has now assumed enormous proportions. It was not, however, the disappointed raisers who brought forward the question of the efficiency of the Floral Committee, but it had its origin in a motion submitted by a member of that body who has occupied the position of chairman for some two or three years past. The motion was to the effect that the number of the members should be increased from twelve to eighteen, and we gathered from the somewhat lengthy speech with which it was submitted, that the proposal was made because the work of the committee as originally constituted had given rise to much criticism. We were under the impression that one of the functions of the chairman of a committee is to defend the body over which he presides from attack, or, if no defence is possible, to retire from the position. Were any other course to be generally adopted, the conduct of public business would soon become impossible. There is not, perhaps, any serious objection to the increase in the number of members of the committee, but there was a grave objection to the manner in which the proposal was made. As proved by the results, it was subsequently an easy matter to carry an instruction to the committee to the effect that no one who sells sweet pea seeds should be allowed to sit on the Floral Committee as an amateur. Had this instruction been moved with a view to exclude dealers in sweet peas from the amateur side of the committee, no objection could have been raised, except that it would be superfluous, as the dealers in seeds are already given their proper place. It was done, obviously, to exclude those who are successful in raising new varieties of sufficient merit to justify their distribution through the usual channels, and who sell the stocks to members of the seed trade. Custom and common sense have long since decreed that an amateur, so far as relates to the garden, is one who grows, with or without assistance, plants, flowers, fruits, or vegetables for his pleasure and the use of his household, and does not habitually sell the produce; and custom and common sense have also determined that an amateur may dispose of the stock of

MR. MARTIN SILSBURY.

any novelty he raises. To adopt any other course would be absurd, a fact which evidently the committee fully appreciates, judging from the course they have taken. As this is the right, and, indeed, the only one that could be taken, we reiterate the hope that the general body of members will make a point of being present at the meeting to support the committee.

Mr. Martin Silsbury, whose portrait we have the pleasure of giving herewith, has for some years past devoted a considerable portion of his leisure to the interesting work of raising new chrysanthemums, and has achieved so high a degree of success as to place him in the front rank of those engaged in the improvement of this important class of flowers. A member of a firm of printers engaged in business at Shanklin, Mr. Silsbury has taken full advantage of the favourable climatic conditions that obtain for cross-fertilisation of chrysanthemums and the ripening of seed in that part of the Isle of Wight, and thereby succeeded in materially enriching the Japanese section, to which he has specially devoted his attention. The meritorious varieties that he has raised would form a somewhat lengthy list, but for our present purpose it will suffice to mention the Hon. Mrs. Lopes, Reginald Vallis, Purity, Magnificent, Lady Isabel, Valerie Greenham, White Queen, J. H. Silsbury, and Splendour. The remarkably fine D. B. Crane, that we had the pleasure of illustrating a few weeks since is also of Mr. Silsbury's raising, and will, unless we are much mistaken, greatly enhance his reputation. Fred Green, F. Chandler, and Millie Chandler, are other varieties of great merit that received distinction from the National Chrysanthemum Society in the autumn of last year.

"Gardeners' Magazine" Sweet Pea Number.—In view of the immense popularity of the sweet pea, and the continued increase in the demand for information on the selection of varieties and their cultural requirements, we shall devote our next issue (January 21) chiefly to these fragrant flowers. We shall give illustrations of a considerable number of the newer varieties, and the contents will include articles on "The Newer Sweet Peas," "Sweet Peas in Small Gardens," "The Future of the Sweet Pea," "Orange and Scarlet Sweet Peas," "The Decorative Value of Sweet Peas," "The Most Useful Sweet Peas," and "The Work of the National Sweet Pea Society."

Horticultural Club.—The next house dinner of the club will take place on Tuesday, 17th inst., at the Hotel Windsor, when Canon Horsley will lecture on the "Scenery and People of the Bernese Oberland and Swiss Plants." The lecture will be illustrated by original lantern slides, and the dinner will, as usual, commence at 6 p.m.

North of England Horticultural Society.—The meeting, to which we made reference in a previous issue, was held at Leeds on January 6, and the North of England Horticultural Society was successfully launched. The chairman, Mr. J. Hastings Duncan, M.P., said they wanted by means of this new organisation to link up the various Northern horticultural societies and make them into one large body, which, in its exhibitions, lectures, and educational work, would be worthy of the North of England. Scientific, Fruit and Vegetable, and Flower and Plant Committees were appointed, and Messrs. D. Roy Appleton, Major J. W. Dent, Reginald Farrer, Claude Reathem, T. E. Hodgson, G. W. Jessop, Hastings Wheeler, A. R. Crossley, R. B. Ker, and W. Mathieson were appointed members of council. The Rev. J. Bernard Hall was appointed secretary, and he agreed to serve for three years, provided the members would back him up in educational work.

Heat and Cold, 1910.—According to the summary of the weather for the past year just issued by the Meteorological Office the mean temperature for the several districts of the United Kingdom did not anywhere differ materially from the average. The highest temperature in the British Isles was 83 degrees, which occurred in the East of England and in the Midlands, and the lowest was 10 degrees below zero in the East of Scotland. At Greenwich the mean temperature was 50.4 degrees, or 0.3 degrees in excess of the average. The highest monthly mean was 62.2 degrees in August, the lowest monthly mean 38.7 degrees in November, the highest temperature 82 degrees in June, and the lowest 20 degrees in January. In July the mean temperature was 4 degrees below the average, and in November the mean temperature was 4.7 degrees below the average. On the other hand it was 3.5 degrees in excess of the average in October, and 5 degrees in excess of the average in December. In November there were fifteen frosty nights.

Weeds and Weed Seedlings.—At the meeting of the Royal Horticultural Society, to be held on Tuesday, 17th inst., a lecture on "Weeds and Weed Seedlings" will be given by Mr. H. C. Long. The chair will be taken at 3 p.m.

National Sweet Pea Society.—A notice has been issued convening a special general meeting of the members of the National Sweet Pea Society for Wednesday next, January 18, at the Hotel Windsor, Victoria Street, Westminster, at 2.30 p.m. The meeting has been called to consider the following proposals, having reference to the Floral Committee. The General Committee, strongly objecting to the definition of an amateur as stated in the instruction carried at the annual general meeting, i.e., "That no member on the amateur side of the Floral Committee be in any way connected with the selling of sweet peas," proposes that such instruction be rescinded. And further proposes that the society shall define an amateur in accordance with the regulations of the Royal Horticultural Society, viz.: "15. No person shall be allowed to compete as an amateur who sells plants (except when giving up possession of the place where they grow, or in the case of new seedlings or sports), grafts, cuttings, or buds for budding, nor any person in the employ of a nurseryman. An 'amateur,' therefore, is a person who grows plants, fruits, or vegetables (either personally or by paid labour) solely for the enjoyment, or for the domestic use, of the produce, and not with the object of pecuniarily benefiting by it. This rule does not necessarily exclude a person who occasionally sells surplus produce arising from an overabundant crop, or from an exuberant natural increase, but who does not intentionally grow for sale."

Gardeners' Royal Benevolent Institution.—The seventy-first annual meeting of the members and subscribers of this institution will be held at "Simpson's," 101, Strand, London, on Thursday, January 19, commencing at 2.45 p.m., for the purpose of receiving the report and financial statement, electing officers for the ensuing year, and the election of annuitants. Mr. H. J. Veitch, F.L.S., V.M.H., will preside, and the poll will open at three o'clock, and remain open one hour. It is proposed to elect twenty annuitants, a number which, we regret to say, is not much in excess of 25 per cent. of the approved candidates. Of these there are 73, 48 of whom are men and 25 women, all of whom are well deserving of the benefits of this excellent charity, the greater proportion having been subscribers or the widows of subscribers, some for upwards of a quarter of a century. Seeing that 53 candidates will have to bear the disappointment inseparable from the failure to obtain a place on the pension list, no one will be prepared to question the judgment of the committee in giving prominence in the notice convening the meeting to the fact that "An increased annual income is urgently needed."

Examination in Horticulture.—With a view to raise the status of the professional gardener, and to promote a better technical knowledge of horticultural matters, the Executive Council of the British Gardeners' Association have arranged to hold an examination in horticulture on Wednesday, April 26, at 7 p.m. The examination will be based on a syllabus comprising fruits, vegetables, plants, trees, and shrubs, plant structure, and essentials for growth, soils and manures, and diseases of plants. Twelve questions, one at least from each section will be set, and eight must be answered to secure marks from the examiners. A fee of 3s. will be charged for each candidate, and applications from gardeners wishing to be examined must be made to the secretary, Mr. J. Weathers, Talbot Villa, Isleworth, at least fourteen days before the date of the examination.

Sunshine and Rain, 1910.—Our readers will not be surprised to learn that there was a deficiency in the bright sunshine recorded during the past year. At Greenwich it was deficient by about 115 hours. May had the highest record with 219 hours, and December the lowest, the duration of bright sunshine having extended over about 30 hours. The summary of the Meteorological Office shows a considerable variation in the duration of bright sunshine in different districts in the United Kingdom. In the North-west of England there was an excess of 63 hours, and in the North of Scotland of 74 hours, while there was a deficiency of 103 hours in the East of England, and 159 hours in the Channel Islands. The aggregate rainfall recorded at Greenwich was 28 inches, or 4 inches above the average, and, excepting 1903, it was the heaviest rainfall during the past 30 years. The rainfall was also over the average in all parts of the United Kingdom, with the exception of the North and West of Scotland, the greatest excess being 9.12 inches in the Channel Islands. The highest aggregate measurement was 49.74 inches in the North of Scotland, and the lowest 25.24 inches in the North-east of England. There were 257 rainy days in the South of Ireland, 195 in the North-east of Ireland, and 195 in the South-east of England.

"Botanical Magazine."—The volume of this publication for 1910 is dedicated to Harry J. Veitch, Esq., F.L.S., V.M.H., "to whose generosity," the Editor states, "the 'Botanical Magazine' is deeply indebted for material assistance from the resources of the establishment of which he is the head."

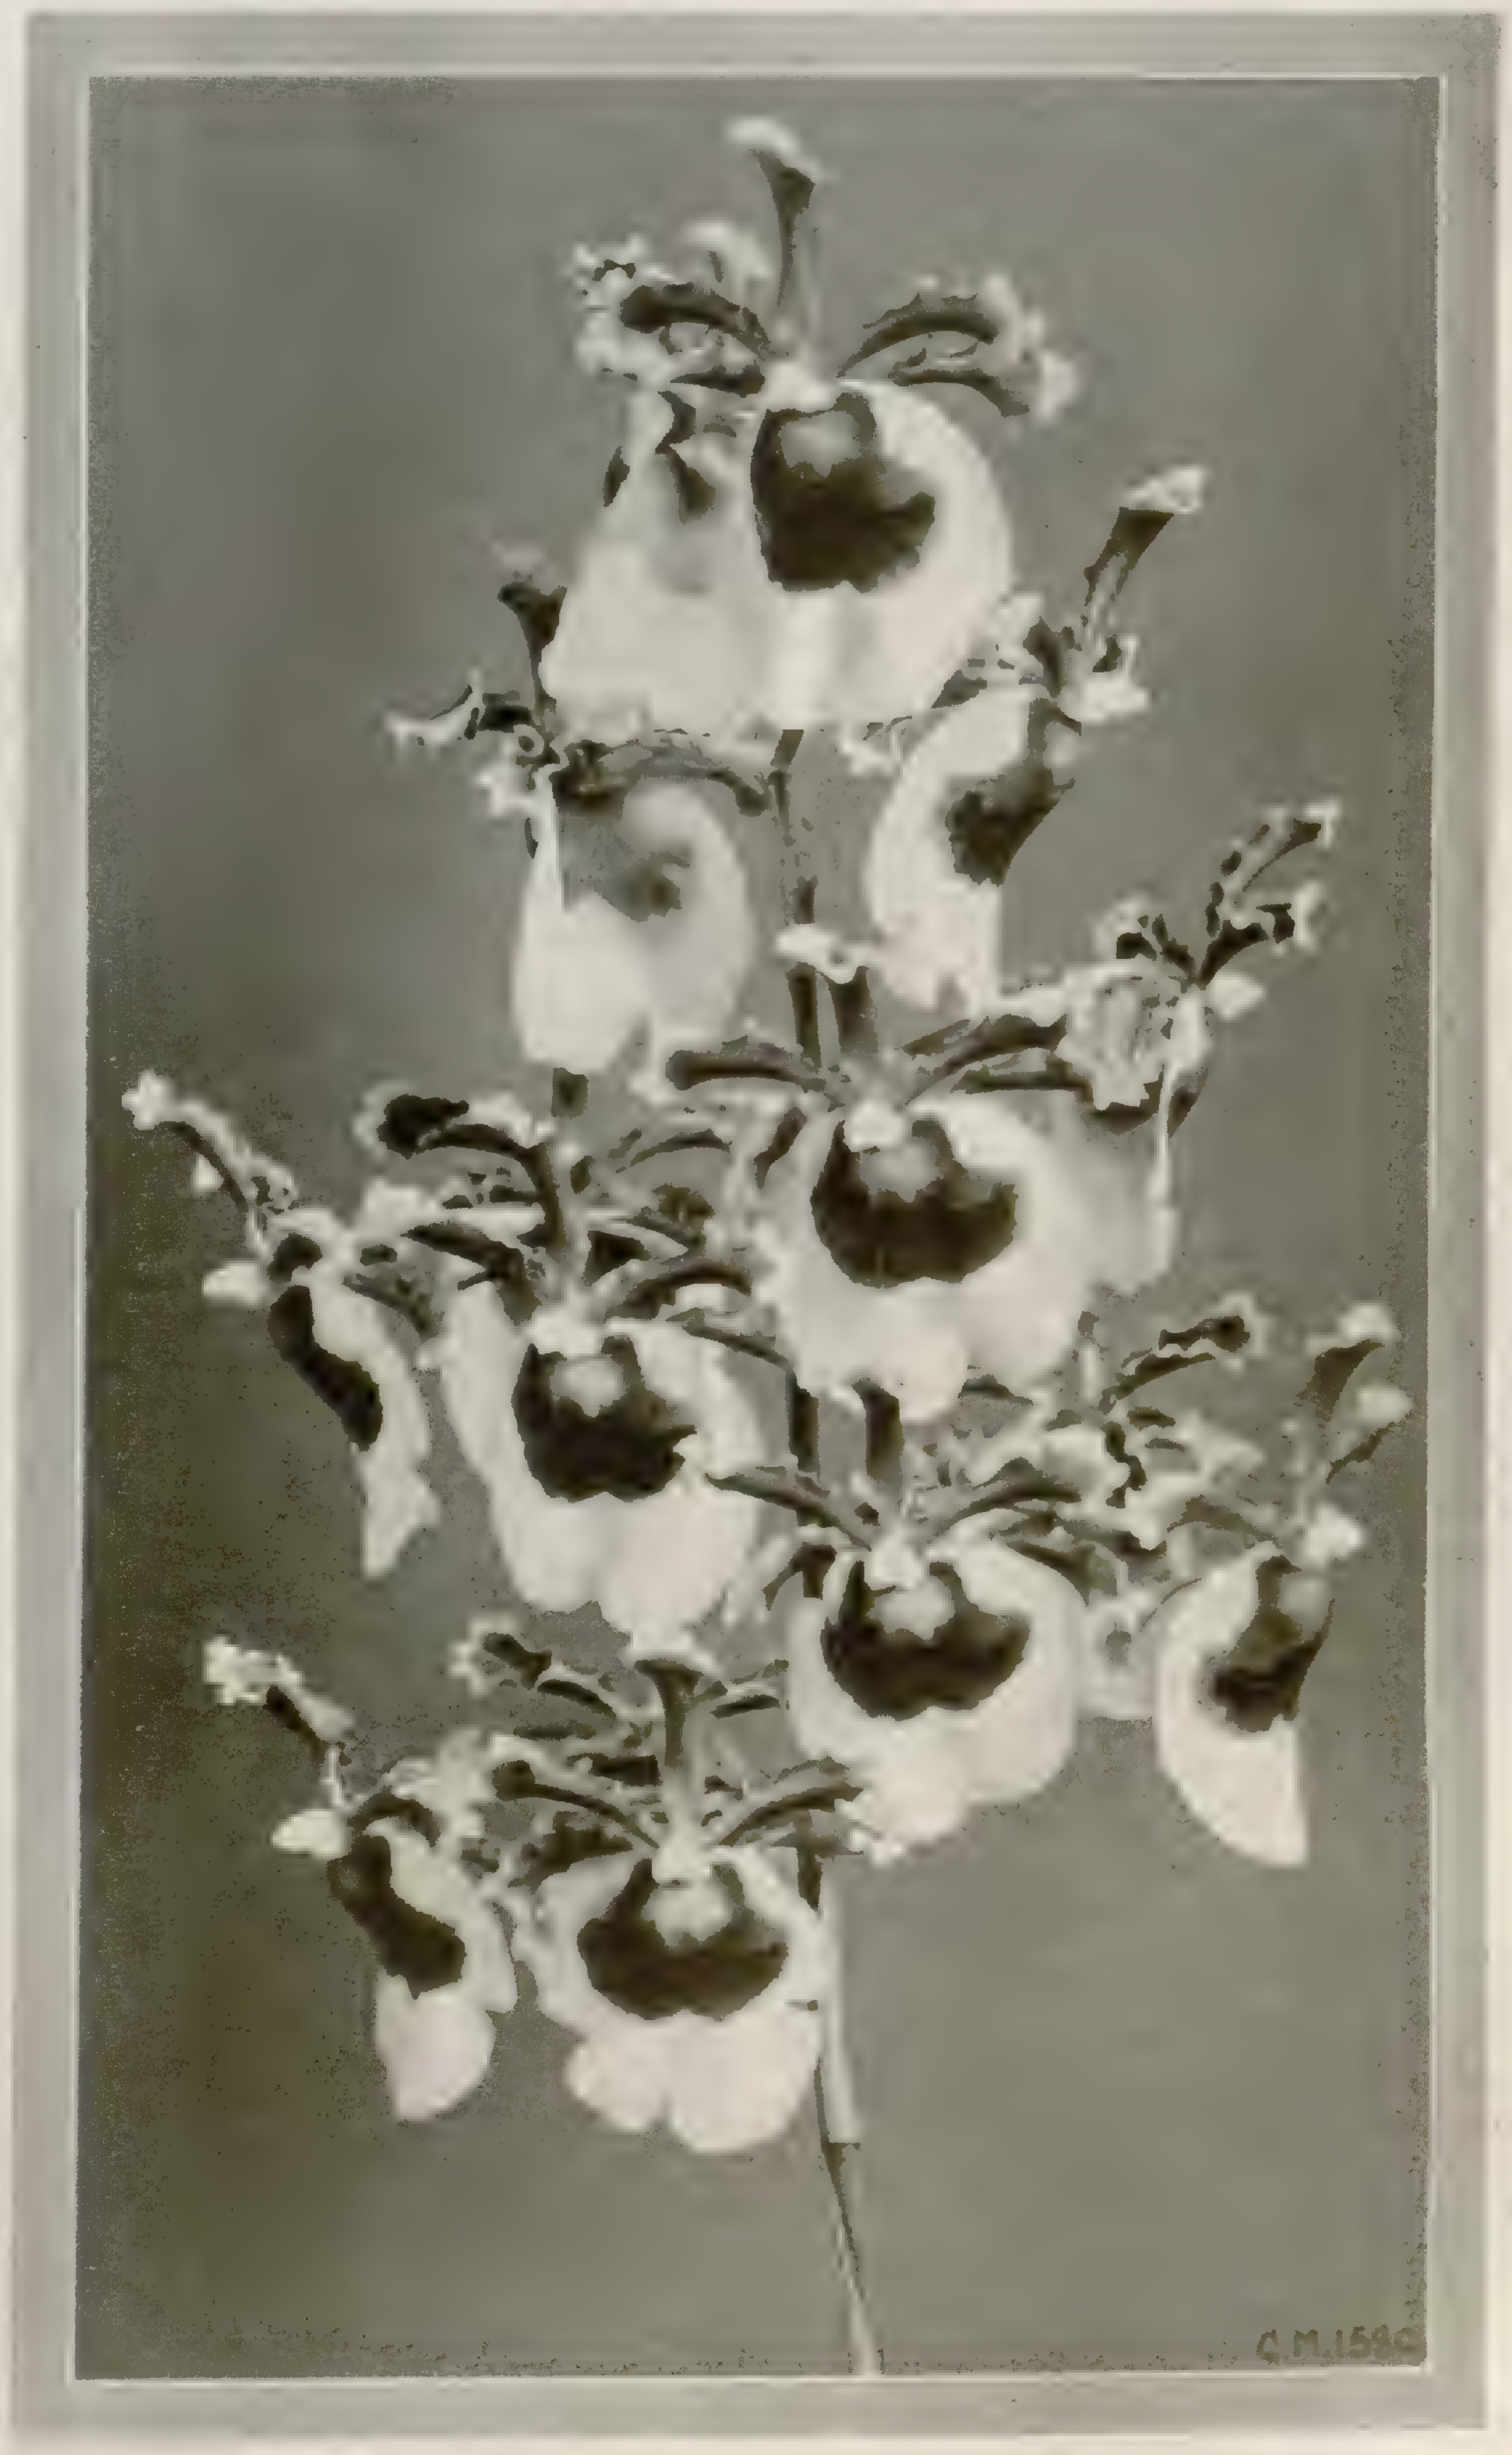
R.H.S. Gardens Club.—This club, which consists of past and present students and employees of the Royal Horticultural Society, has published No. 3 of its "Journal," and the issue is in some respects an improvement upon the two numbers by which it was preceded. Of special interest are the contributions by Mr. F. L. Chittenden, F.L.S., Mr. A. Simmonds, and Mr. W. D. Cartwright on the Wisley flora, and the contribution by Mr. J. Fraser on "The Old Chiswick and the New."

Manuring of Apple Orchards. —In a bulletin recently issued by the Pennsylvania Agricultural Experiment Station some interesting particulars are given of a series of experiments in the manuring of apple orchards in Pennsylvania. The experiments, which extended over three years, were conducted in eleven orchards, with an aggregate area of 91 acres, and comprising ten soil types and twelve varieties of apples. It is pointed out by the authors of the bulletin that no recommendation can be made that will be exactly adapted to all circumstances, but as the results of the experiments they are in a position to state that where a fertiliser is needed good results may be obtained from a dressing of artificial manure containing 30lb. nitrogen, 60lb. to 75lb. phosphoric acid, and 50lb. potash per acre. Young trees require smaller, old trees heavier dressings. Nitrate of soda should be given after the blossoms fall; other manures during winter or spring. Nitrogen may also be profitably supplied by growing and digging or ploughing in some leguminous crop, such as clover. It is mentioned that the quantities of plant food recommended may be made up as follows per acre: 100lb. nitrate of soda (15½ per cent. nitrogen), 100lb. dried blood (12 per cent. nitrogen), 250lb. to 300lb. steamed bonemeal (24 per cent. phosphoric acid), and 100lb. sulphate of potash (50 per cent. potash).

My Garden Diary for 1911 is a dainty publication we have had the pleasure of receiving from Messrs. Sutton and Sons, and is not less welcome than the issues for previous years. On the covers is depicted a charming garden scene, in which weeping standard roses, herbaceous plants, and annual flowers are admirably represented. Between the covers are reminders of the work to be done in each month of the year, monthly notes, and spaces for memoranda. There are also selections of annuals and other plants usually grown from seed.

Sulphate of Ammonia.—From the report of the Chief Inspector of Alkali Works we learn that there are 536 works or separate processes for the manufacture of sulphate, or muriate, of ammonia in the United Kingdom, or an increase of nearly 100 during the past five years. Sulphate of ammonia is chiefly obtained as a bye-product from coal. When this is treated for the production of coal gas, or for the manufacture of coke used in iron smelting, an ammoniacal liquor results, which forms the raw material for the manufacture of ammonium salts. The quantity of sulphate of ammonia produced in the United Kingdom during 1909 was 349,000 tons, of which 264,000 tons were exported. The balance of 85,000 tons for home use was 6,000 tons less than in 1908.

Floras of the Jurassic Period. —Professor A. C. Seward, F.R.S., devoted his presidental address at the recent annual meeting of the Yorkshire Naturalists' Union to a consideration of the Jurassic flora of the East of Yorkshire in relation to the Jurassic floras of the world, and gave much interesting information relating to these floras. Having described the estaurine beds of East Yorkshire as being among the most important strata of the world as regards their fossils, and passed under review the work of William Bean, J. Williamson, W. C. Williamson, and other investigators, Professor Seward proceeded to give a general sketch of the flora. The fossil flora of the Yorkshire coast is, he stated, remarkable for the abundance of ferns and cycads and certain types of conifers, but it is not possible to determine the relative abundance of the different groups. It is regarded as probable that the Ginkgoales occupied a prominent position in the composition of the vegetation. With regard to the ferns of the Jurassic period, it is a point of some interest that their nearest living allies are to be found in the southern hemisphere. Comparison with recent genera of cycads is rendered difficult by the great gulf between recent members of the group and those which flourished in Jurassic times. There is, however, no reasonable doubt that the cycads of the present day are derived from an ancient stock, which produced also Williamsonia and other Jurassic genera. In this case also the recent plants most nearly akin to those of the Meozoic floras are chiefly characteristic of southern regions, and this general statement is applicable to the relation of some of the Jurassic conifers to recent types. In the genus Ginkgo of the Jurassic world we have a member of a group which would probably have ceased to be represented among living plants had not the recent species long been held in veneration in the Far East as a sacred tree. During the Rhætic and Jurassic eras and in the succeeding Cretaceous and Tertiary epochs, the genus Ginkgo was widely distributed in Europe. As late as the Lower Tertiary period it existed in what is now the West of Scotland in a form not differing materially from the well-known maiden-hair tree. In discussing the relation of the Yorkshire Jurassic flora with that of other parts of the world, Professor Seward said it was remarkable to find that almost precisely similar plants to those occurring in the Yorkshire rocks are also found in strata of about the same age at places so far distant as America, Australia, Greenland, India, Japan, Siberia, and Turkestan. This wide distribution seemed, in Professor Seward's opinion, to indicate that the climate in Jurassic times must have been much more uniform over the world than is at the present time the case.



MILTONIA WARSCEWICZI LEUCOCHILA.

Flowers rose, crimson-purple, and white. A.M., R.H.S., December 20, 1910. Messrs. Charlesworth and Co., Haywards Heath.

THE PURPOSES AND POETRY OF TREES.

A tree is but a plant possessed of a woody stem; a shrub is but a small tree; there are diminutive plants, such as the heather, that might claim to be classed among the trees, so sturdy are their stalks, and there are trees, of which the silver birch is an example, whose slender trunks bend more than do some blossoms before a gale.

From time immemorial the laws of symbolism have given meanings to our forest, plain, and mountain giants: from farthest ages they have had their purposes as elements in manufactures, at first rude uses in the formation of rough tools, then gradually to serve the aims of art; clothing, food, medicines came also from the trees. The ancient Britons are known to have had some kind of oak-built navy, even before they lived in houses made by hands but sheltered in natural caves; the lavish harvest of acorns constituted their daily bread, and immense tracts of our land were covered by dense oak forests. So great was the vigour imparted by this diet that a poet described how these hardy warriors,

"Fed with the oaken mast,
The aged trees themselves in age surpassed,"

which must be surely an example of literary license, since another rhymer, Dryden, has stated,

"The monarch oak, the patriarch of trees,
Shoots rising up, and spreads by slow degrees;
Three centuries he grows, and three he stays
Supreme in state, and in three more decays."

In many of our world-famous ancient churches the carvings that have survived until the present day are those that were carried out in the native oak: attention may especially be drawn to the wondrously beautiful shrine of St. Edward the Confessor, in Westminster Abbey. It has been interestingly recorded that the Bible has many mentions of this tree. When Gideon saw the Lord's messenger he was beneath an oak, Jacob buried the strange idols and ornaments of his household "under the oak that was by Sechem; near "the oak of weeping" Deborah, Rebekah's nurse, was interred, and it was through branches of oaks that Absalom, the son of David, met his death.

In pagan lore the oak possesses unique renown as having formed the Donean groves of Greece, where spake the oracles, for which reason the wreaths of heroes were made of its leaves. We have all pictured in fancy those vast woods wherein clustered

"The sacred oaks,
Among whose awful shades the Druids strayed,
To cut the hallowed mistletoe, and hold,
High converse with their gods."

Under the figure of an oak, Baal, the Celtic god of fire, was worshipped, his festival being held at Yule-tide, our present Christmas; all the fires of the people were extinguished, in order to be lighted again from the sacred fires kept burning by the priestly Druids.

Probably the grandest tree, next to the oak, is the pine; it lives where winds would sweep away all weaker species, it clears vegetation out of its path, spreading only a carpet of cones and spines, with occasionally a group of fungi, brilliant as blossoms, and quaint of form. As the national tree of Scotland it has the heaths for its subjects, and no beauty in all Nature is perhaps dearer to the eye and heart of artist than the colours taken by its ruddy bark beneath the rays of the setting sun. See it in moonlight, too; note how each trunk becomes a warm sepia shadow between shafts of silver light; listen to the peculiar music of its boughs as they clash together beneath a gale, and an understanding will gradually arise in the mind why it is that the Highlander can imagine no scene more fair than a lonely wood of pine. Pity is its symbol, while the heather signified solitude. Of the value of its wood there is no need to speak; but the millions of planks of deal among which we live come to us from Norway.

Lime wood is of the greatest service to Art.

"Smooth linden best obeys
The carver's chisel, best his curious work
Displays in nicest touches."

It is of a cream shade naturally, and, as it does not warp with changes of temperature, it is used for the sounding-boards of pianos, and the panels of carriages and cabinets. The masterpieces of Grinling Gibbons, at Windsor and Chatsworth, St. Paul's Cathedral, and elsewhere, are executed in this wood. We may also recall with gratitude that the blossom makes a refreshing cordial, helps in medicine and cosmetics, that the famous Lithuanian honey owed its excellence to being gathered directly the bees had stored it from odoriferous forests of the lime, while a humble use for a portion of its inner bark is the manufacture of bast matting. In the language of flowers the linden tree signifies conjugal love.

The horse chestnut is said not to have been imported into England until about the middle of the sixteenth century, and came from the far distant mountains of Thibet. No records seem to explain why its motto is "Do me justice." The blossom has been compared, not unjustly, to a hyacinth, and it is a fact that if the flowers are used, without any leaves, among fern fronds, for table decoration, they give a marvellously beautiful effect. The bud of this chestnut contains wonders indeed; pluck one when not larger than a pea, in earliest spring, unfurl its cover, noting how this consists of seventeen scales, underneath which is a bed of down; below lie four leaflets, surrounding a miniature flower spike; naturalists have brought the microscopic lens to bear upon this gem, and so have counted the individual flowerets, to the number of sixty-eight. Luxury is its symbolic meaning. Spanish chestnut wood is the best of all for making casks for rare wine, as it has no tainting odour or juice, and quite arrests evaporation.

The elm was brought to us by the Crusaders, or earlier by the Romans, we are told, though it was first thought to be a native. Its wood made the wheels of most of the water mills that are passing out of use in our land; it was also used greatly in shipping and cart building. The famous diarist, Evelyn, tells us that the leaves were formerly much valued as food for pigs and cows, which would eat them in preference to oats, and thrive well upon them, for which reason elms were planted in quantities in meadows. This tree often towers from ninety to one hundred feet high, and is symbolical of "dignity."

Of hornbeam wood were always made the yokes for the oxen that used to plough our soil; the ploughs themselves were, too, of this extra-firm timber. Hornbeam hedges of quaint devices still exist in many old-world gardens, clipped into strange forms of birds and beasts, and built up to great height. A kinder meaning than "ornament" might, however, have been found for a tree so wise that it often keeps its old leaves as a protection until the new ones push them away.

An authority on the beech has written, "By the union of grace and nobility it may claim precedence over every other member of our sylva. The autumnal hues are rich and glowing in the extreme, and when a beech grove has assumed the intense orange-yellow that it displays at a certain season, the effect is most striking; the radiance overhead being repeated by the fallen leaves below, till earth and air seem saturated with golden light." He added the interesting information, "There is an extraordinary variety of the beech, called the purple beech, which has its leaves when quite young of a cherry-red colour, and at midsummer, when quite matured, of such an intense purple as to look almost black." The original tree from which all purple beeches are said to have been derived, was found by accident in a wood in Germany about ninety years ago, but what gave rise to such a remarkable and permanent deviation from the ordinary colour of the foliage it is impossible to say. The copper-coloured beech is merely a sub-variety, with the purple element less developed. Oil used to be extracted from the kernels of the beech-mast. Ancient writers call it the tree "of all prosperity," a blessing to the house it guards.

Proverbs dealing with trees include the following:

"An oak is not felled with one blow."

"It's a gude tree that has neither knap nor gaw."

"No tree but has rotten wood enough to burn it."

"Remove an auld tree an' it'll sune wither."

"As a tree falls, so it lies."

M. H.

THE PERPETUAL FLOWERING CARNATION SOCIETY.

At the recent exhibition of the Perpetual Flowering Carnation Society a noticeable feature, in spite of the excellence of the display as a whole, was the reluctance or shyness of the amateur cultivator in coming forward with his exhibit. This is regrettable, because the perpetual flowering carnation is a flower from which an amateur with a slightly heated greenhouse can obtain more pleasure and profit probably than from any other flower. The Perpetual Flowering Carnation Society exists for the encouragement and interests of this flower, and, although the prizes offered in the amateurs' section are not large ones, they are well worth the attention of amateur growers, and even those who only grow a few plants. Turning to the section for amateurs and gardeners possessing more plants, many valuable prizes are offered. The President's (Lord Howard de Walden) fifty-guinea cup, and such money prizes as 20s. for one bloom, are well worth attention. Those intending to exhibit at the next show, to be held at the Royal Botanic Gardens, should become members at once, and proceed with the needful preparations. The subscription is only 5s., but, of course, members may pay a larger amount, and those subscribing 10s. 6d. or 21s. have additional privileges.

LAURENCE J. COOK.

Bush Hill Park, Middlesex.

Cotoneaster angustifolia.—Half a dozen years ago some branches of this cotoneaster, absolutely laden with bright orange coloured berries, were shown at one of the winter meetings of the Royal Horticultural Society by M. Maurice Vilmorin, and a First Class Certificate was awarded it. Though so fine at Les Barres, it has not proved to be a great success in this country, being too tender for many districts. In general appearance Cotoneaster angustifolia bears a considerable resemblance to the pyracantha, and it is now in the "Botanical Magazine" figured as Pyracantha angustifolia, a change of name which should be taken note of.—W. T.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

HAVE YOU GOT A SEED SOWING TIME TABLE?

It would be just as useful to you when you want to sow seeds as a railway time table is when you want to catch a train, and would help you to make sure of sowing your seeds at the proper time to ensure

THE BEST POSSIBLE RESULTS.

It would also enable you to have your plants in bloom or your vegetables ready for table just when wanted. If you are an exhibitor it would tell you the correct time to sow in order to have your produce in the best possible condition for the show. So far as we know, Stormonths' Catalogue of

WARRANTED BEAU-IDEAL SEEDS IN 1d. PACKETS

is the only reliable source whence this information may be obtained. A copy will be sent, post free, on receipt of your name and address on a postcard.

Moneymaker Tomato

¶ A WONDERFUL CROP—from 12 to 20 fruits in a bunch, even in size, handsome solid flesh, excellent flavour, very free. The most useful tomato I have ever grown. ¶ REMARKABLY FREE CROPPER, excellent flavour, serviceable size, good colour, smooth and attractive appearance. ¶ SPLENDID ACQUISITION. Have grown it alongside other well-known varieties, and have found nothing to compare with it. For cropping, shape, colour, and flavour unequalled. ¶ SPLENDID VARIETY, and rightly named. A tremendous cropper, carrying bunches of from 18 to 24, and often more fruits, very fine, and of excellent flavour. ¶ GRAND CROPPER. Have a fine show of them—from 12 to 18 in a bunch. Free setter, disease resisting, and rightly named.

All this is unasked-for testimony. "Moneymaker" carries its fruits in clusters of 10 to 18—and more, the fruits weighing 6 and 7 to the pound, and remarkably uniform. Colour a bright red, skin very thin, flesh deep, flavour delicious. The plant has a fine constitution; bears at nearly every joint, and ripens its fruits early. Well adapted for inside or outside cultivation, **1/6** *per pkt.*

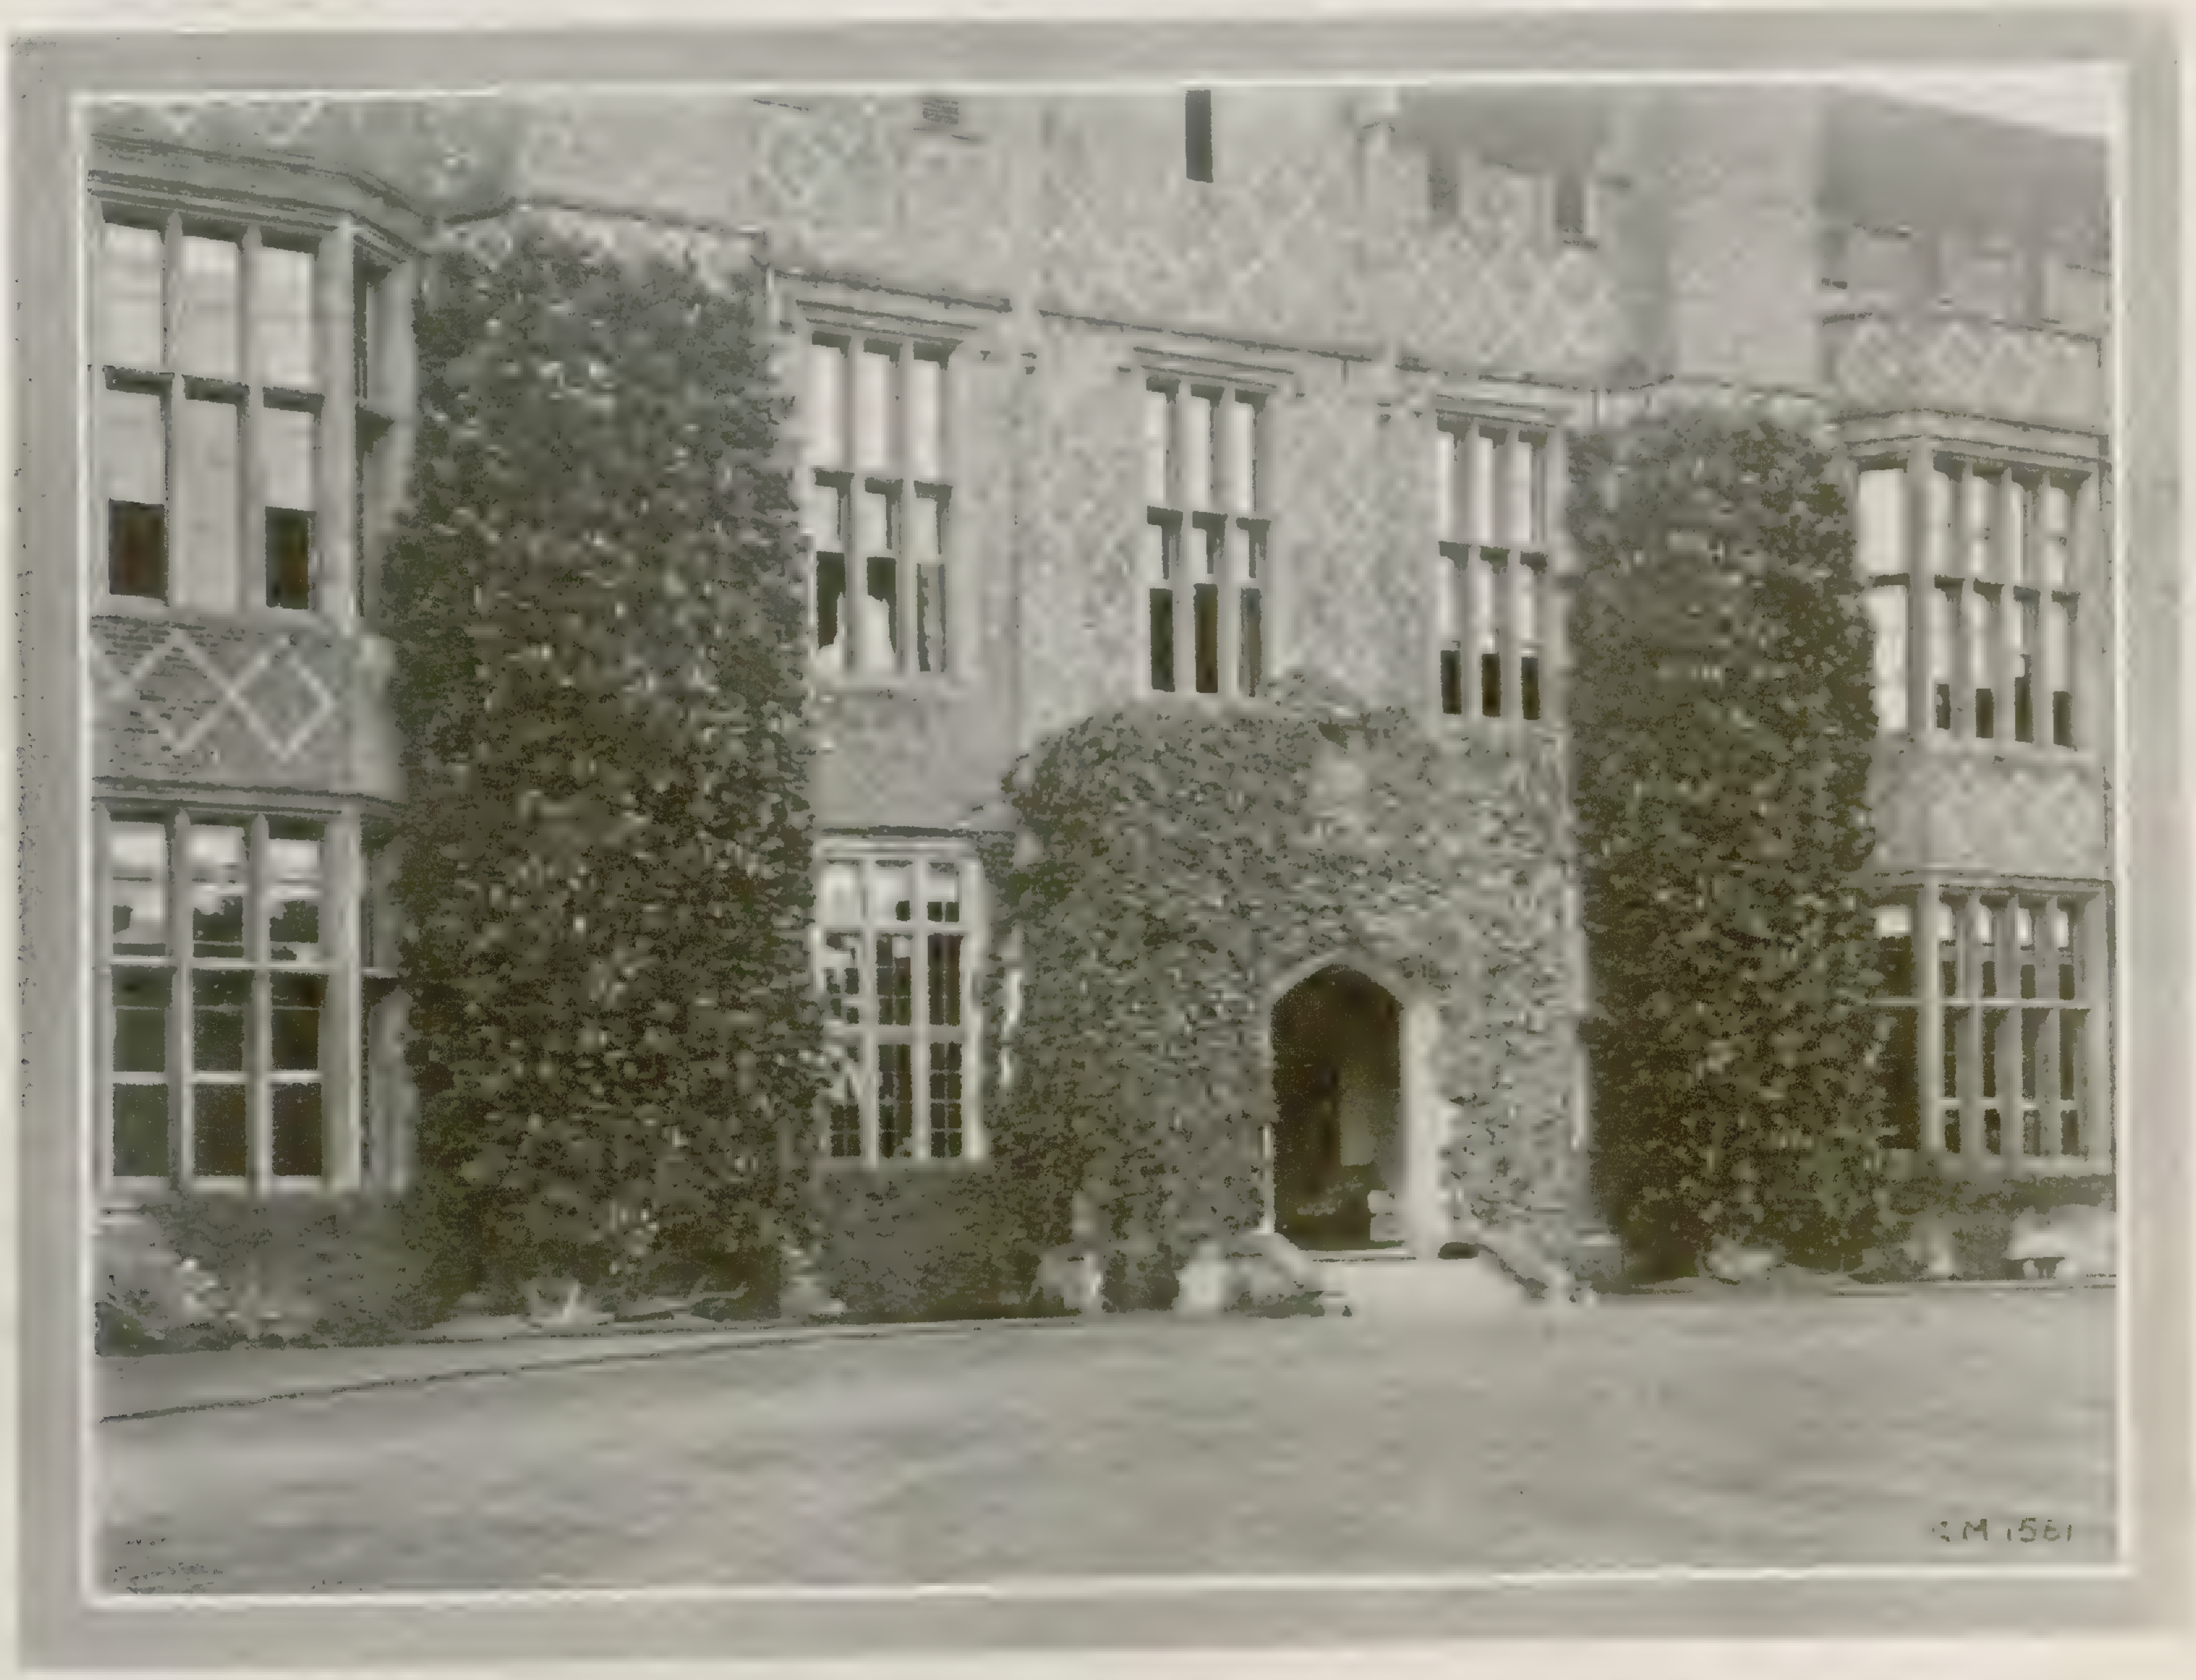
MAGNOLIAS.

In the GARDENERS' MAGAZINE of December 31, 1910, I had the pleasure of describing some of the magnolias of special value for beautifying the garden, and I now purpose referring to a few others that are equally well deserving the attention of the planter.

M. grandiflora.—This is probably the best known of all the magnolias, especially in the south. It is a native of the Southern United States, and has been given the name of "Bull Bay." Its large, handsome evergreen foliage and immense white fragrant flowers are familiar objects, and it is difficult to imagine a more ornamental evergreen tree when it is well grown. Unfortunately, it is somewhat tender, and, except in the south and south-west counties, it must be planted against a wall, while in very cold localities it cannot be called a success, even in such a position. In southern gardens trees have been noted 20 to 35 feet high, with trunks a foot in diameter. In the Southern United States it sometimes attains a height of 100 feet. It varies somewhat in character, and a number of distinct forms have been given varietal names. Of these angustifolia is distinguished by its narrow leaves: ferruginea by the undersides of the leaves being covered with a dense reddish felt: lanceolata, sometimes called exoniensis, by reason of its small, lance-shaped foliage: and undulata, which is recognised by the undulated margins of the leaves. There is, however, still another variety, M. g. gloriosa, which is the most beautiful of all, its flowers being very large and globular.



MAGNOLIA GRANDIFLORA ON THE WALLS OF MAPLE-DURHAM HOUSE.

This illustration of the fine specimens of Magnolia grandiflora at Maple-Durham House, Reading, the residence of the Hon. A. Mills, is of special interest as showing a system of training by which the walls of houses may be beautified with vegetation without having their structural features hidden, a point of much importance in the case of mansions representing distinct styles of architecture.

M. hypoleuca.—Very few really good examples of this species exist in the country, for it is only of late years that it has become well known. In his "Forest Flora of Japan," Sargent describes it as a very beautiful species, and, though it has flowered but a few times in England, it promises to justify what has been said in its favour. In addition to its flowers, it is said to be very beautiful in its home in Japan when covered with its bright red cones of fruit in autumn. It most closely resembles M. tripetala in appearance, so far as leaves are concerned. They are sometimes 15 to 18 inches in length, and 6 to 7 inches wide. The flowers are white and fragrant, about 6 inches across, and borne in summer. It forms a large tree in Japan, and appears as if it will attain to the dimensions of a tree in this country.

M. Kobus.—This is a large-growing tree in Japan, for it attains a height of 70 feet with a trunk 2 feet in diameter. It is perfectly hardy, and of vigorous constitution. There appears to be close relationship between this species and M. stellata, for it is difficult to tell the leaves apart and the flowers are white and similar in size, but single, while those of M. stellata have an abnormal number of petals. Like other magnolias it thrives best in moist, rich ground.

M. macrophylla.—Unfortunately, this Southern United States species is not very hardy, and it is only here and there that really good examples are seen. A few years ago a good specimen which flowered freely was to be seen in the Coombe Wood Nursery, whilst a fine one exists at Claremont, the estate of H.R.H. the Duchess of Albany. It is recognised by its large, obovate, or oblong leaves, which are sometimes 2½ or 3 feet long, and by its large yellowish flowers, which are 8 to 9 inches across. The glaucous colouring of the underside of the leaves is another good distinguishing feature.

M. obovata.—This is perhaps the hardiest of all the magnolias. It is a native of China, and grows into a widespreading bush 8 or 10 feet high. It blossoms in April, the flowers being purplish or reddish-purple. With M. conspicua it has been the means of providing a number of ornamental varieties, which have been previously alluded to. There is, however, a widely-grown form, which is often used for forcing, called rustica, which differs from most of the other kinds by its high colour. It most closely resembles Lennei, and may not really be an obovata hybrid, though its origin has been given as obovata x conspicua. It has also been thought to be a hybrid from Lennei.

M. parviflora is an exceedingly beautiful summer-flowering magnolia, and one of our choicest flowering shrubs. Unfortunately, it does not appear to possess a very good constitution, but where good specimens exist it is really charming. It is a deciduous species, with oval leaves. The flowers are borne during May and June, and are white in colour, with a central mass of crimson stamens. When fully expanded they are about 3 inches across.

M. stellata.—Now one of the commonest magnolias in the country. This species was practically unknown twenty years ago, and what few plants existed were accommodated in greenhouses. No doubt, however, now exists as to its hardiness, except that the flowers are sometimes damaged by late frosts, hence the necessity for giving it a sheltered position. It grows naturally into a shapely bush, and will attain a height of at least 12 feet. Each year its blossoms are borne with the greatest freedom, the flowering time being April. The flowers are semi-double, 3 inches or so across, star-like, and glistening white in colour. When at its best it is difficult to picture a more charming shrub. Its native country is Japan.

M. salicifolia is a distinct small-leaved species from Japan. So far sufficient time has not elapsed since its introduction to allow us to judge of its hardiness and merits. It is of slender growth and has small flowers.

M. Thompsoniana is stated to have originated as a seedling in the Mile End Nursery of Mr. Thompson as long ago as 1820, according to London. Its parents are said to be M. glauca and M. tripetala, but this can be supposition only. It has closer affinities with the former than with the latter species, but the leaves and flowers are larger, whilst it is of stronger growth.

M. tripetala is known under the common names of "Umbrella Tree" and "Elkwood." It is a native of the United States, where it forms a tree up to 40 feet in height. It has been in cultivation in England for a century and a-half, but it is by no means common. Its most striking features are its large obovate-lanceolate leaves, which sometimes measure 2 to 3 feet in length, and the red cones of fruits which succeed the white flowers. The flowering time is summer.

M. Watsoni resembles M. parviflora in many respects, but is of stronger habit, with larger foliage and flowers. It is a native of Japan, and was introduced 18 or 20 years ago. A very fine specimen exists at Stevenstone, in North Devon, which in June last year carried about 100 open and unopen flowers. In colour the flowers are similar to those of parviflora.

W. Dallimore.

PLUM EARLY PROLIFIC.

The recent reference to the merits of Early Prolific plum afforded me considerable pleasure, as I have long regarded it as the best early variety in cultivation. It readily adapts itself to almost any kind of soil which contains a fair percentage of lime, and any form of training. It succeeds equally well as a bush, pyramid, standard, or wall tree, and is a sure cropper in seasons that are at all favourable. Its wood is of a twiggy nature, is easily ripened, and, being a prolific bearer, it does not require root-pruning. In fact the usual difficulty with this plum is to induce it to make wood, and so ensure an increase in the size of the tree. But, although it is a slow grower, it soon pays for its cost in the first instance, and room afterwards, by its annual yield of fruit at a season when plums are scarce, even in a plum year. It comes into use about the end of July, and is useful for both dessert and culinary purposes.

For market purposes Early Prolific has no rival, and will always command good prices. In spite of all these many good points, it is seldom met with in private establishments, and yet it is the one plum that should be in every garden. Of course, as in the case of other plums, it likes a soil rich in phosphates, potash, and lime, and not too much organic matter, as the latter has a tendency to foster the production of succulent wood in seasons when spring frosts, or cold winds, have destroyed the crop. Where there is a choice of a position for a plum on a wall I would advise a western aspect, and Early Prolific if a useful black early plum is desired.

Pedestrian.

POT CULTURE OF HARDY FRUITS.

The cultivation of fruit trees in pots is becoming of considerable importance in many gardens, and is a valuable addition to the older and more general system of planting permanent trees. By this method of cultivation early crops can be more easily produced, and these invariably prove very useful until the general crops of fruit are ripe. In the case of peaches and nectarines one is able with pot trees to grow a greater variety of fruit in one house.

A good house for fruit trees in pots is a span-roof running north and south, but for very early supplies a lean-to facing due south is preferable. If a lean-to house is not available the trees may be started in an early vinery, and when the foliage of the vines develops move the trees to another structure, it being important for them to have as much light as possible. When commencing the cultivation of fruit trees in pots it must not be assumed that a tree can be lifted from the open ground, potted up, and immediately cropped, as such assumption will result in disappointment. Trees that are three or four years old, and have been grown in pots from maidens are the best to purchase.

It is important to repot the trees every year, and this operation should be commenced during October. See that they are not dry at the roots when repotted, as the wood is liable to shrivel when that is the case. Pots from ten inches to twelve inches in diameter are the most suitable, and these are large enough for the majority of trees. It is necessary to reduce the ball sufficiently to allow plenty of new soil to be worked around it. Make the soil quite firm, as this encourages the production of fibrous roots, and a more fruitful condition of the wood. A good compost for trees consists of rich fibrous loam, a fair proportion of half-inch bones, some crushed charcoal, and old mortar rubble. The latter not only helps to keep the soil open, but it adds to the soil the calcareous matter essential to stone fruits. Water well after potting, and syringe the trees on bright days. It is better to leave them in the open until the time arrives for starting them in the forcing house, in the meantime protecting the pots by plunging them in ashes or leaves. Pot-grown trees require very little pruning, but what is necessary should be done before they are started.

Peaches and nectarines for very early forcing must be placed under glass in November, but other trees can stay out until January or February, according to the time that ripe fruit is wanted. They will not require much water at the roots until growth becomes active, it being a good rule to keep the soil moderately moist. The trees should be syringed overhead several times daily in bright weather. It is important not to subject them to a high temperature at the commencement, 45 degrees by night, with a rise of five degrees in the daytime being quite sufficient. As in the case of other fruits under glass, it is necessary to artificially pollinate the flowers. Some gardeners prefer to keep a hive of bees in their orchard house, and so ensure the flowers being fertilised naturally.

When the fruits are set, and commencing to swell, begin to feed the trees with liquid manure; also maintain a moist atmosphere, and admit air freely on favourable occasions by means of the top ventilators. Mildew is often troublesome in some varieties during the early stages of growth. To avoid this vaporise with sulphur, and fumigate occasionally with nicotine compound to keep down aphis. Thinning the fruit must be carefully attended to; the number that should be allowed to remain will depend on the variety and the vigour of the tree. Finally, in the case of apples, when the fruit has almost done swelling, the pots may be plunged in the open on a south border, as this greatly assists the fruit to colour. Shade lightly during periods of bright sunshine, spray overhead two or three times daily, and guard against birds by protecting the trees with netting when necessary. Dessert varieties of apples and pears grown in pots are much appreciated before the outdoor fruit is ripe. It is not worth while growing culinary varieties unless they are required for exhibition. Peaches, nectarines, cherries, plums, and figs succeed well in pots, and are better finished under glass altogether.

J. Gardner.

SAXIFRAGA PELTATA.

Those who are only acquainted with the smaller saxifrages which are such choice ornaments of the rock garden, can hardly realise the immense void which separates them in appearance from the great Californian saxifrage, as Saxifraga peltata is sometimes called. It stands alone, and seems to have no real connecting link with the others of the genus; but, in point of its cultural needs, and also, to a slight degree, in the appearance of the inflorescence, it approaches such species as S. pennsylvanica, another of the few American species of saxifrages.

But it is almost as far apart as the poles in every way, even from its compatriot, and is a plant which appeals to us on quite different grounds from its compeers.

It is when at rest a mass of creeping rhizomes, quite thick, and rather flattened, from which arise in spring great clusters of white or pale pink flowers, on thick stalks some two feet or so high, and covered with short white hairs. These do not last very long, and when they have faded the massive leaves, which are the most ornamental parts of the plants, are produced. They are on petioles about two feet high, but this depends upon the treatment the plant receives. The leaves are circular, and rather deeply cut at the edges, are what is called peltate, or shield-like, from the stalk being set in the middle of the leaf. The leaf is a little funnel-shaped, and water lodges in its centre during rain. The colour is of a deep rich green, passing off in autumn through fine reds and browns, and is at that season especially attractive. A good plant sends up a mass of these fine leaves, which are as much as fifteen or eighteen inches across, and are most handsome when of the latter size.

To obtain the best results, and to give the plant the treatment it requires to do it justice, S. peltata should be planted in a moist and cool place. By the side of a stream, river, or pond it flourishes best, and will send its rhizomes into the bed of the water. At Mount Usher the thick rhizomes are to be seen running along the rocks which form the bed of the little River Vartry, which flows through the grounds, and there the plants are very fine indeed. Where these places are not available, S. peltata will thrive in a moist, shady part of an ordinary garden, but in a poor dry soil it is quite robbed of its beauty by the absence of vigour. It is increased by division or by seeds. A native of California, S. peltata, which is the sole representative of the peltiphyllum section of the saxifrages, was introduced about the year 1873.

S. Arnott.

APPLE JAMES GRIEVE.

Of late years this fine Scotch-raised dessert apple has received a considerable share of attention from cultivators of hardy fruits, and we hope that at no distant period it will be planted more largely than has yet been the case. It is certainly not represented in gardens in accordance with its merits, more particularly in Scotland and the Northern counties of England, where but few of the choice dessert apples succeed. The history of this variety has been told in these pages on more than one occasion, and need not now be recapitulated. Neither does it appear desirable to institute comparisons between James Grieve and Cox's Orange Pippin, as some writers have done, for the two apples do not come into competition with each other. Both are remarkably handsome, and of high quality, but James Grieve ripens much earlier, and succeeds in Northern gardens where Cox's Orange Pippin cannot be grown successfully without shelter. In those counties of England and Ireland that are favourable to apple culture both these excellent varieties should be planted for the purpose of obtaining a supply of dessert apples of high quality over the longest possible period. In the counties that are not favourable, and throughout Scotland, James Grieve should be grown.

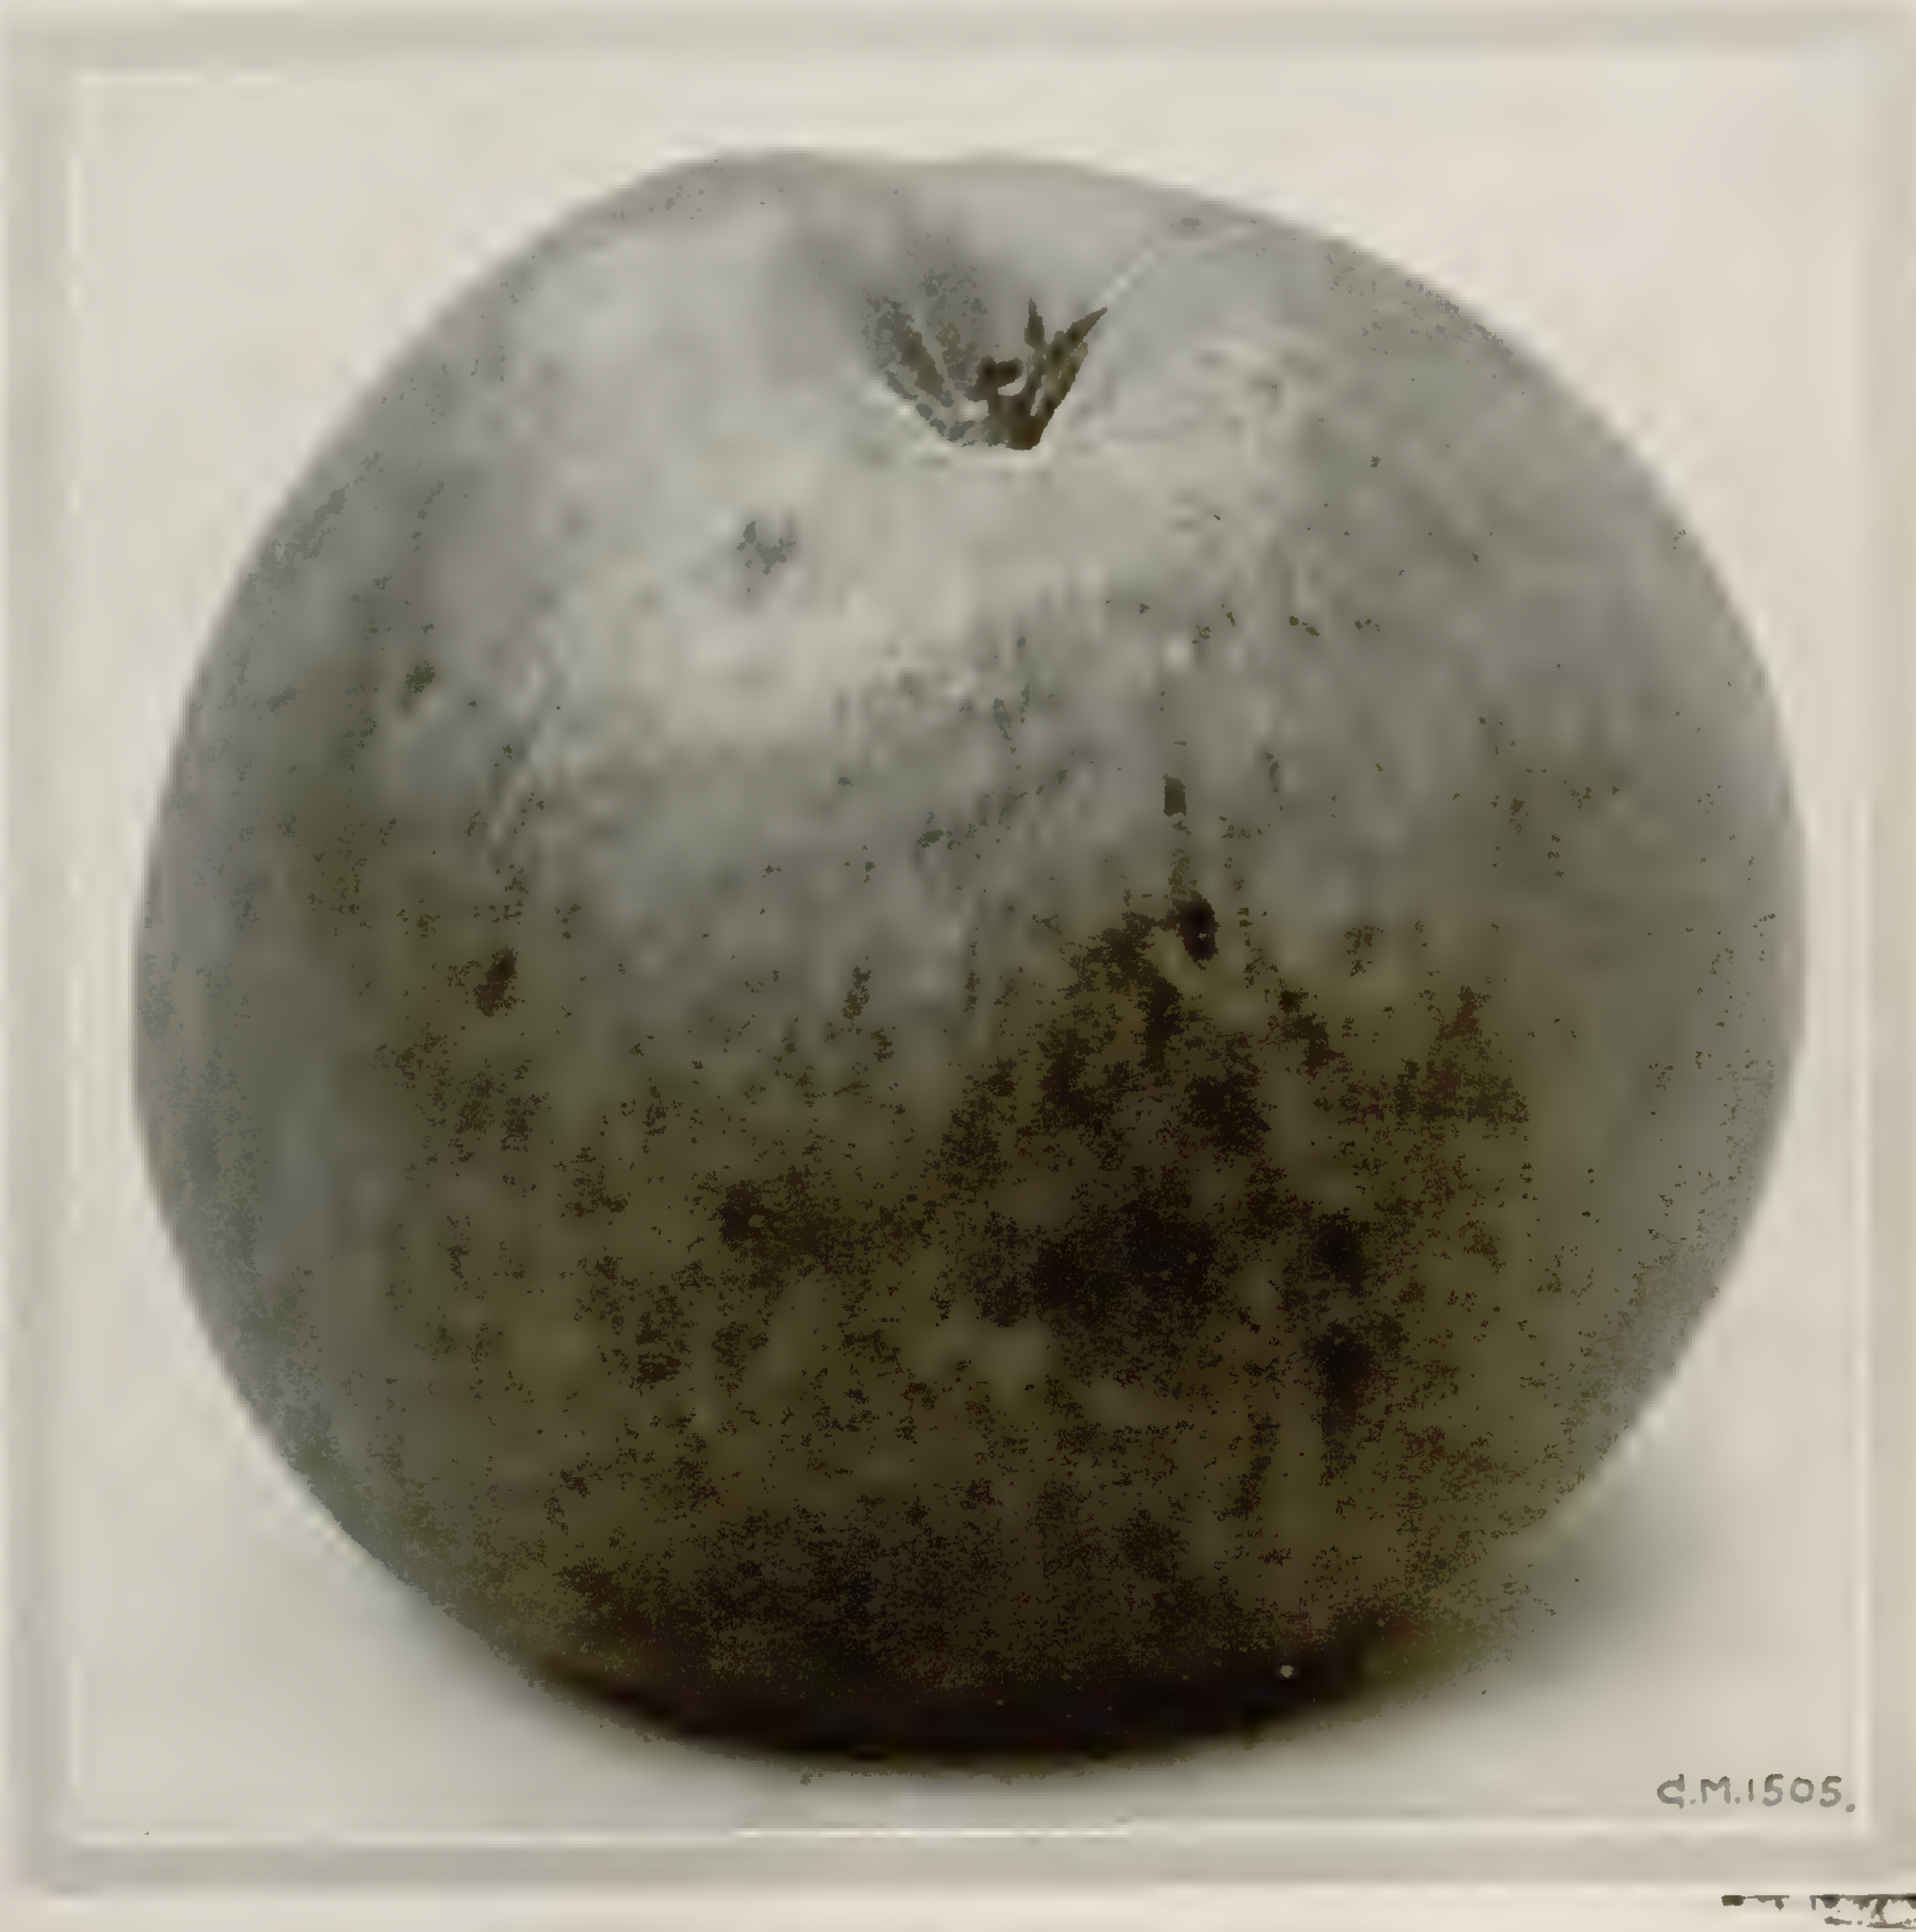
A short time since Mr. J. Day, the able chief of the Galloway House Gardens, Garlieston, wrote in a contribution to these pages in highly appreciative terms of James Grieve, and at the Northern Counties Fruit Congress, held at Hexham in October last, there was a remarkable consensus of opinion as to the great value of the variety for Northern gardens, and it was described as one of the best of the dessert apples that have a place in the experimental plots formed by the respective educational authorities of Cumberland, Northumberland, and Westmorland. The form of the fruit when at its best, is well shown in the accompanying illustration. The skin is pale yellow, marked with deep red, and the flesh is tender, juicy, and richly flavoured. The fruit is in season during September and October, but, as in the case of other varieties, the period of ripening is greatly influenced by soil and climate. The tree is of upright growth, and makes a fine bush on the paradise stock, and is thus specially adapted to garden culture.

Tomatoes.—To raise plants for the production of fruit in May and June a sowing of seed should be made now, in pots; the soil should be of a light porous character. Place them in a forcing house, and, after germination has taken place, keep the young plants near the roof glass to ensure a stout, short-jointed growth. Pot off singly as they show their rough leaf, using sweet loam, lightened with sand and old mushroom bed manure to encourage active rooting. Sunrise is an excellent variety for this purpose.—C F.

Primula obconica.—When this primula, which had been sent home from China by Charles Maries, first flowered in 1880, few could have been prepared for the improvement that has taken place in it. At first it was a poor little starry flower, of not a particularly attractive lilac shade, and now the flowers are large and bold, while the colour ranges from white to a kind of carmine-red. Furthermore, it proves to be continuous flowering, or nearly so, and for greenhouse decoration it has but few equals. The one drawback is that in some persons it sets up an irritation of the skin, but as a set off there are many that are not troubled by it. In my own case it never causes the least inconvenience.—W. T.

PROPAGATION OF LILIES.

Lilies are propagated by scales and bulblets, and although rather a slow process, requiring three or more years to bring the young bulbs to a flowering size, we have the satisfaction of knowing that they are vastly more enduring than the imported bulbs, and that if correctly treated the majority of species will prove of permanent interest and value. Amongst those that produce bulblets in the axils of the leaves are the old tiger lily, and its altogether more refined and handsome varieties, splendens and flore pleno. L. canadense and the Bermuda lily are also well known species bearing bulblets, which almost invariably appear upon the whole length of stem. Towards the end of the summer they assume a very dark colour, and as soon as they separate very readily from the axils of the leaves they should be collected, and stored in sand until the following spring.



DESSERT APPLE JAMES GRIEVE.

Some species and varieties do not produce bulblets, but we have a ready means of increase by detaching a few of the outer and mature scales, and laying them horizontally upon a mixture of sand, cocoanut-fibre, and charcoal dust, and then covering them lightly with the same material. In the course of six weeks roots will appear on the basal part, and often on the edges of the scales, and when it is seen that a few have been formed, they should be placed a couple of inches apart in boxes or deep pans filled with a compost consisting of equal parts peat and loam, with a small quantity of leaf-soil and sand added. Their winter quarters will be the greenhouse shelf, and from spring onwards an unheated frame, and this also applies to the first-named. It may be explained that the Continental growers obtain huge supplies of bulblets by lacerating the basal part of inferior bulbs. These are partially cut through in various directions, and are then planted in a light and sandy soil. Having experimented in this direction, I can testify that it is simply astonishing to see the behaviour and efforts of the bulbs to perpetuate their species, each crevice becoming literally a mass of small bulbs. I commend this practice to amateurs who may wish to propagate lilies, and a single bulb of each species will be sufficient to commence with. In dealing with the bulblets I would advise that they be grown in boxes for a couple of years, as they require far less attention than when placed in small pots, and when they have developed to the size of a billiard ball they should be potted, and it will be found that pots four and a-half inches in diameter will be none too large for them.

The more hardy, robust, and accommodating species may be planted in the open garden to form permanent colonies; in fact, almost without exception lilies can be successfully grown in this way, and failures that are recorded may invariably be traced to mismanagement, or to imported bulbs having been planted, and it is well known that the most popular lily, namely, L. auratum, is of little use after flowering. Under the most careful treatment only a very small percentage bloom the second year, and it seems a great pity that the bulbs should be mutilated and denuded of every vestige of basal root prior to exportation by the Dutch and Japanese growers.

By far the most successful colonies of lilies will be seen in close proximity to, or between, shrubs, such as rhododendrons, etc., and we gather from this that the shrubs throw just the requisite amount of shade on the surface; also that the masses of thread-like roots emanating from the shrubs effectually prevent saturation in winter, a combination of favourable circumstances which has much to do with the eminently satisfactory results obtained under these conditions.

Walter H. Aggett.

MISTAKES IN GOOSEBERRY GROWING.

It is doubtful if any fruit tree or bush is so remunerative, and that within such a short time after planting, as the gooseberry, when properly managed. A mistake that is often made is the retention of old and worn-out bushes, the gooseberry cropping very heavily in a young state, and often being past its best after twelve or fifteen years. When bushes have their buds picked out much by the birds they are often becoming unprofitable in a less period than this, owing to the scantiness or even absence of fruit spurs on the inner parts of the branches. As soon as the crops begin to show any signs of falling off, or the vigour declines, in spite of liberal manuring, it is a good plan to make a new plantation, choosing fresh ground which has previously been deeply cultivated and well manured with animal manure, the gooseberry and the black currant being the only hardy fruits that cannot be too liberally dealt with. After two years, or at the most three, the old bushes may be destroyed, the young trees after that time producing good crops of fine fruits if they have been well grown. Young bushes planted early during the winter in good soil, with the current year's growth shortened to one-third, and not allowed to bear any fruit the first season, will often make shoots a yard long the first summer, and if this is shortened to one-half in the autumn, a nice crop of fruit may be gathered the next year, and a fine healthy bush obtained.

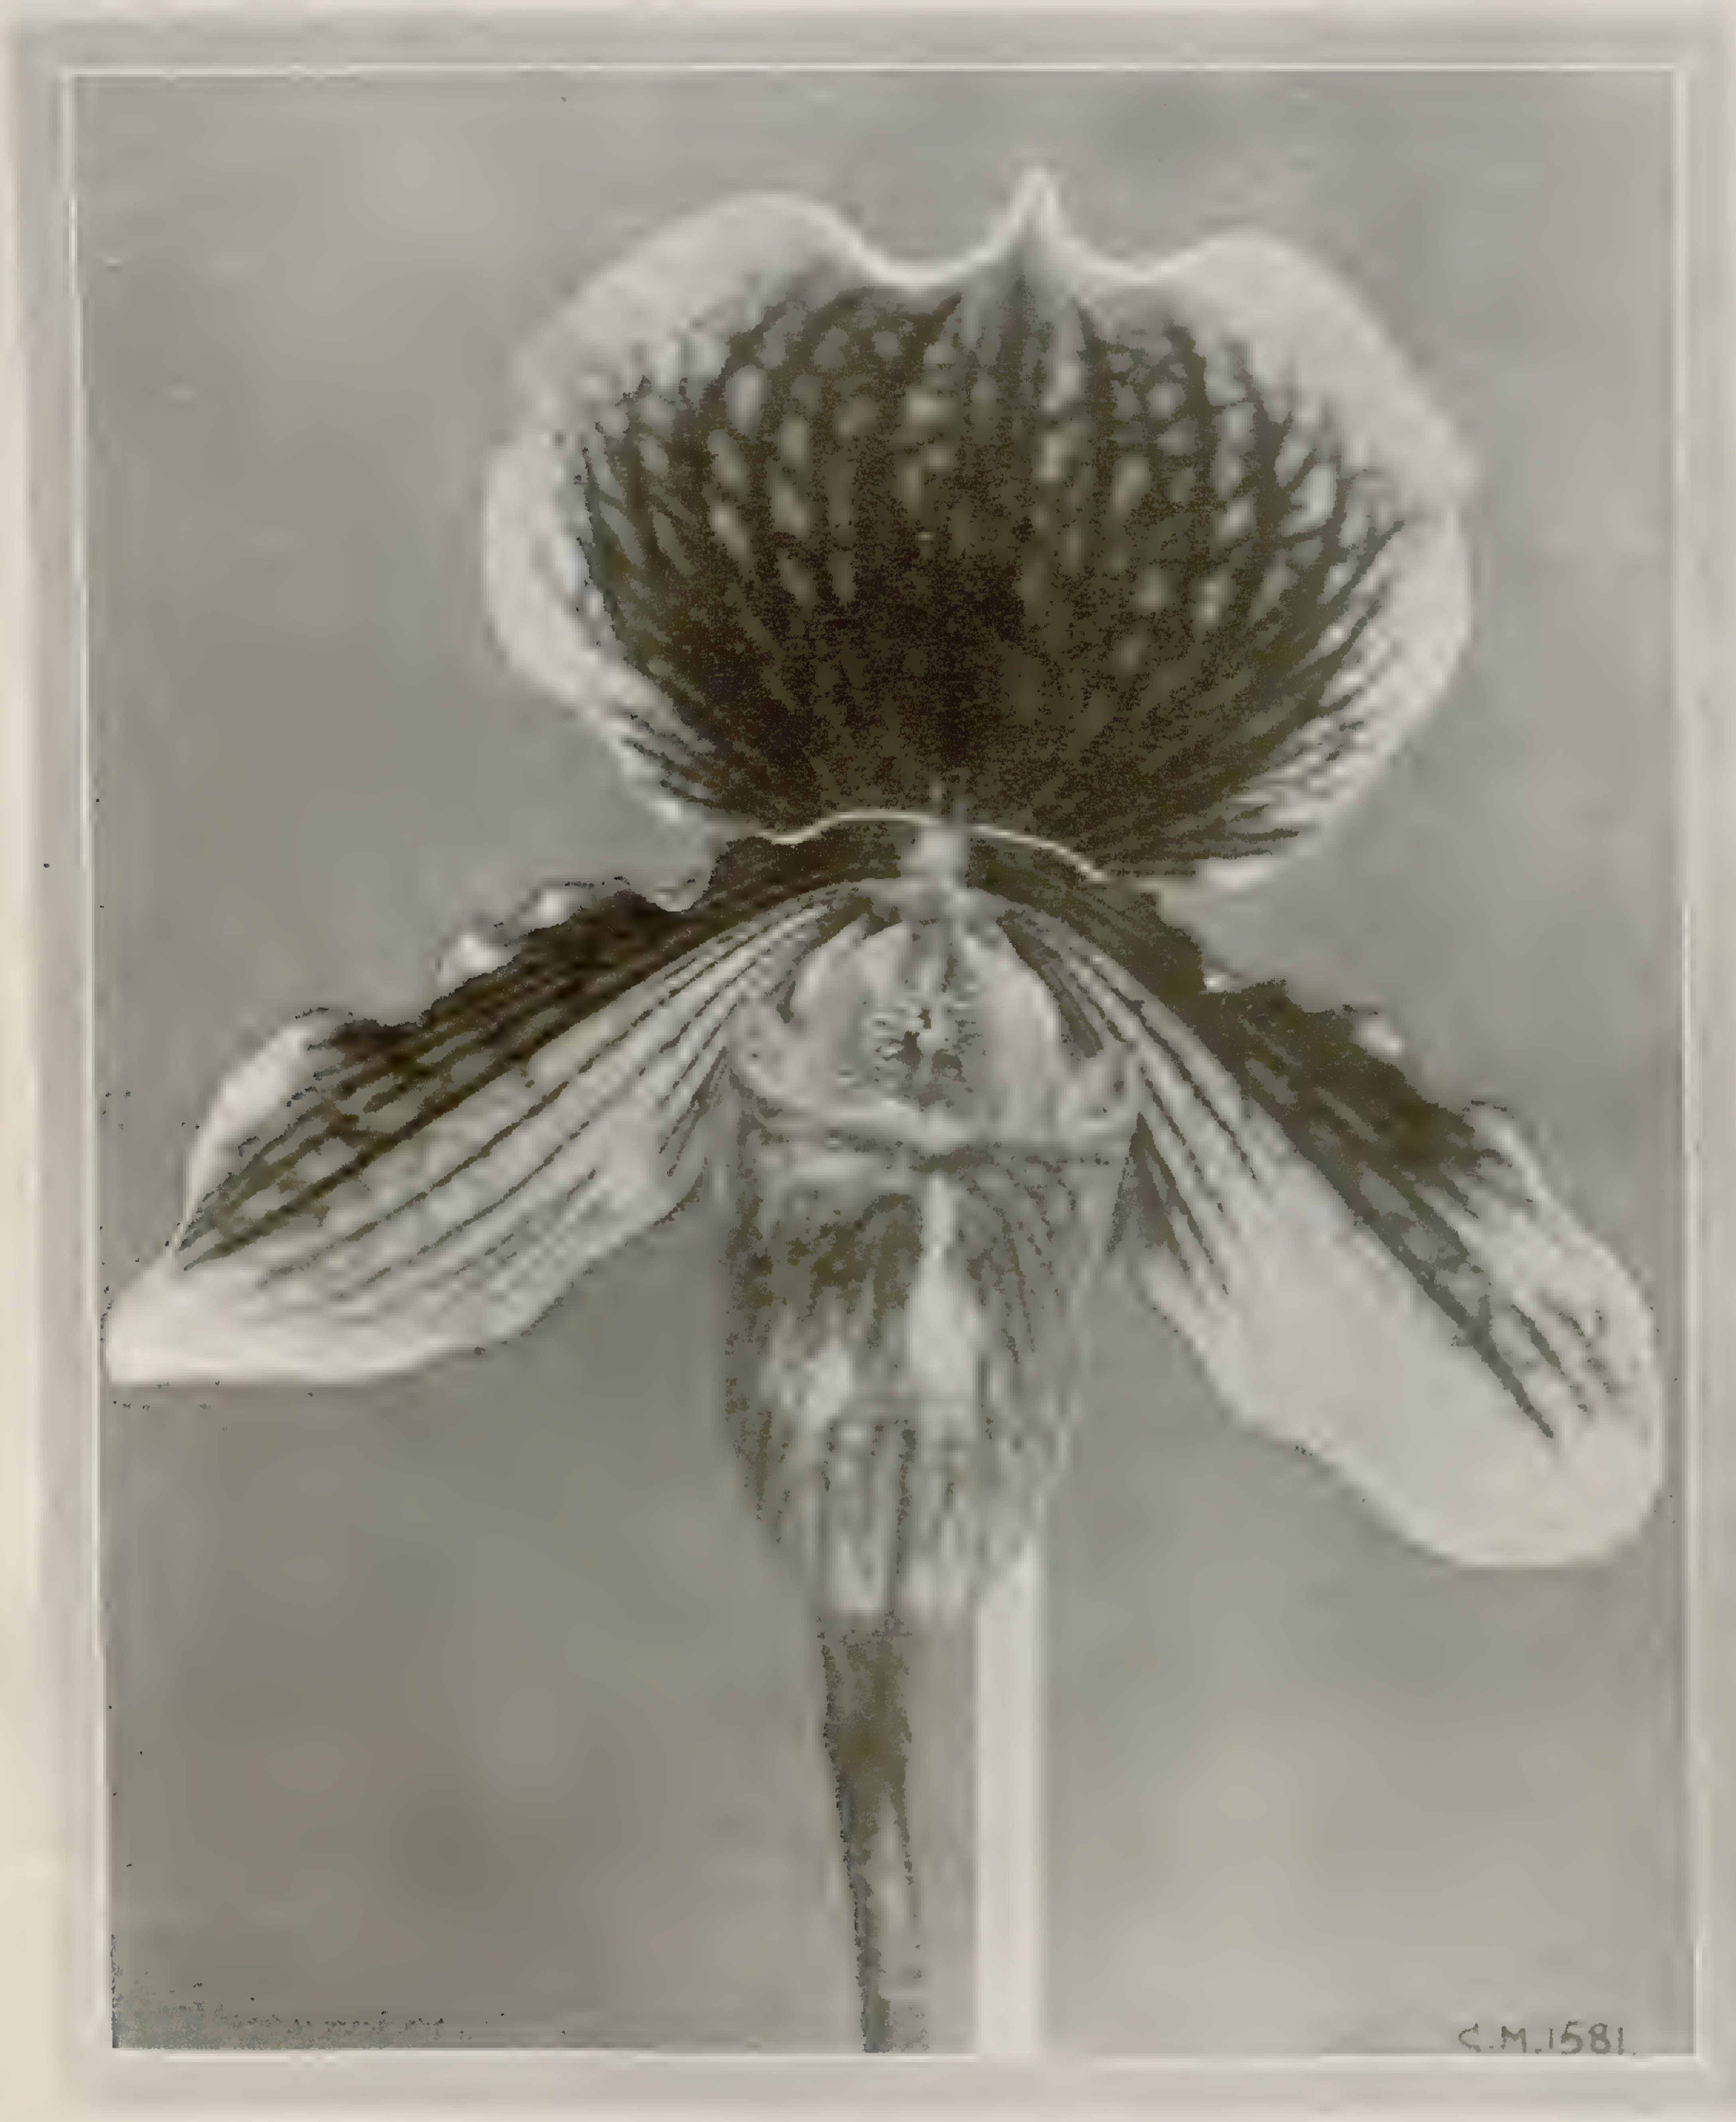
Another mistake often made with gooseberry bushes is to let them carry their whole crop till it is ripe. This practice not only permanently impairs the vigour of the tree but means a loss in the total weight of fruit obtained. If the fruit is thinned in the green state for kitchen use the remaining fruits swell up to a much greater size, while at the same time the tree is relieved of the strain of ripening such a large quantity of seed—the really exhausting part of the crop. A further advantage is that the branches are not weighed down to such an extent, especially if the thinning is most vigorously done on those branches least able to support the weight of the full crop, that the fruit becomes splashed, and the branches permanently depressed as is so often the case.

A third mistake lies in the neglect of proper feeding. The Woburn experiments go to show that, no matter what chemical manures are given, the gooseberry, after a few years, fails to give the best results unless animal manures are applied. If the soil is a light one potash is no less essential, and it is probably to the richness of stable manure in this constituent, when made with straw, that the benefit derived from it is most largely due.

A good system of manuring on a heavy soil would be a quarter of a pound of basic slag to each bush in the winter, followed by an ounce of nitrate of soda in the spring, both the lime in the former and the soda in the latter setting free some of the stores of potash in the clay. On a light soil it would be better to substitute for the basic slag the same amount of bonemeal in the autumn or superphosphate in February, supplemented by an ounce of kainit in the winter or an ounce of sulphate of potash at the same time as the nitrate of soda. If the soil is poor in lime a dressing of slaked lime at the rate of ten to fifteen pounds to the forty square yards, or chalk at twice this rate, should be applied before superphosphate or kainit are used, as they are both lime destroyers. The manures should always be applied at least as far as the spread of the branches, and beyond them is better, and it is a good practice to lightly work them in with a hoe. Whatever the soil or the manures applied, some good rotted manure should be turned under the surface soil early in the spring, and the bushes will be all the better for a mulch in the summer, either of manure or grass cuttings, weeds, and the like. To those who have grown gooseberries on the laissez faire method, and been content with two or three quarts of fruit, or less, to the bush, the results of liberal manuring will be surprising. Anyone can experiment for himself if he doubts it.

A final mistake to be alluded to is pruning. The fruit spurs on the inner parts of the branches cannot be expected to remain healthy and vigorous if the tree is such a thicket of growth that the sun never reaches them during the summer. In the middle of May, or even earlier in some seasons, all the shoots for which there will be no room inside the tree another year should be pinched to three or four leaves, thus keeping the tree fairly open during the summer, for the gooseberry, unlike the apple and pear, rarely makes much secondary growth after being pinched. This openness of the tree should be carried a step further by giving it the final pruning for the year as soon as the fruit is gathered, adopting the principle of leaving as much as possible of the young growth on the outside of the tree its full length, and doing the necessary thinning to prevent congestion the following spring, by cutting out some of the older and less vigorous branches right from the centre.

ALGER PETTS.



CYPRIPEDIUM GASTON BULTEL.

Flowers large, rose-purple, green, and white. A.M., R.H.S., December 20, 1910; Mr. E. V. Low, Haywards Heath.

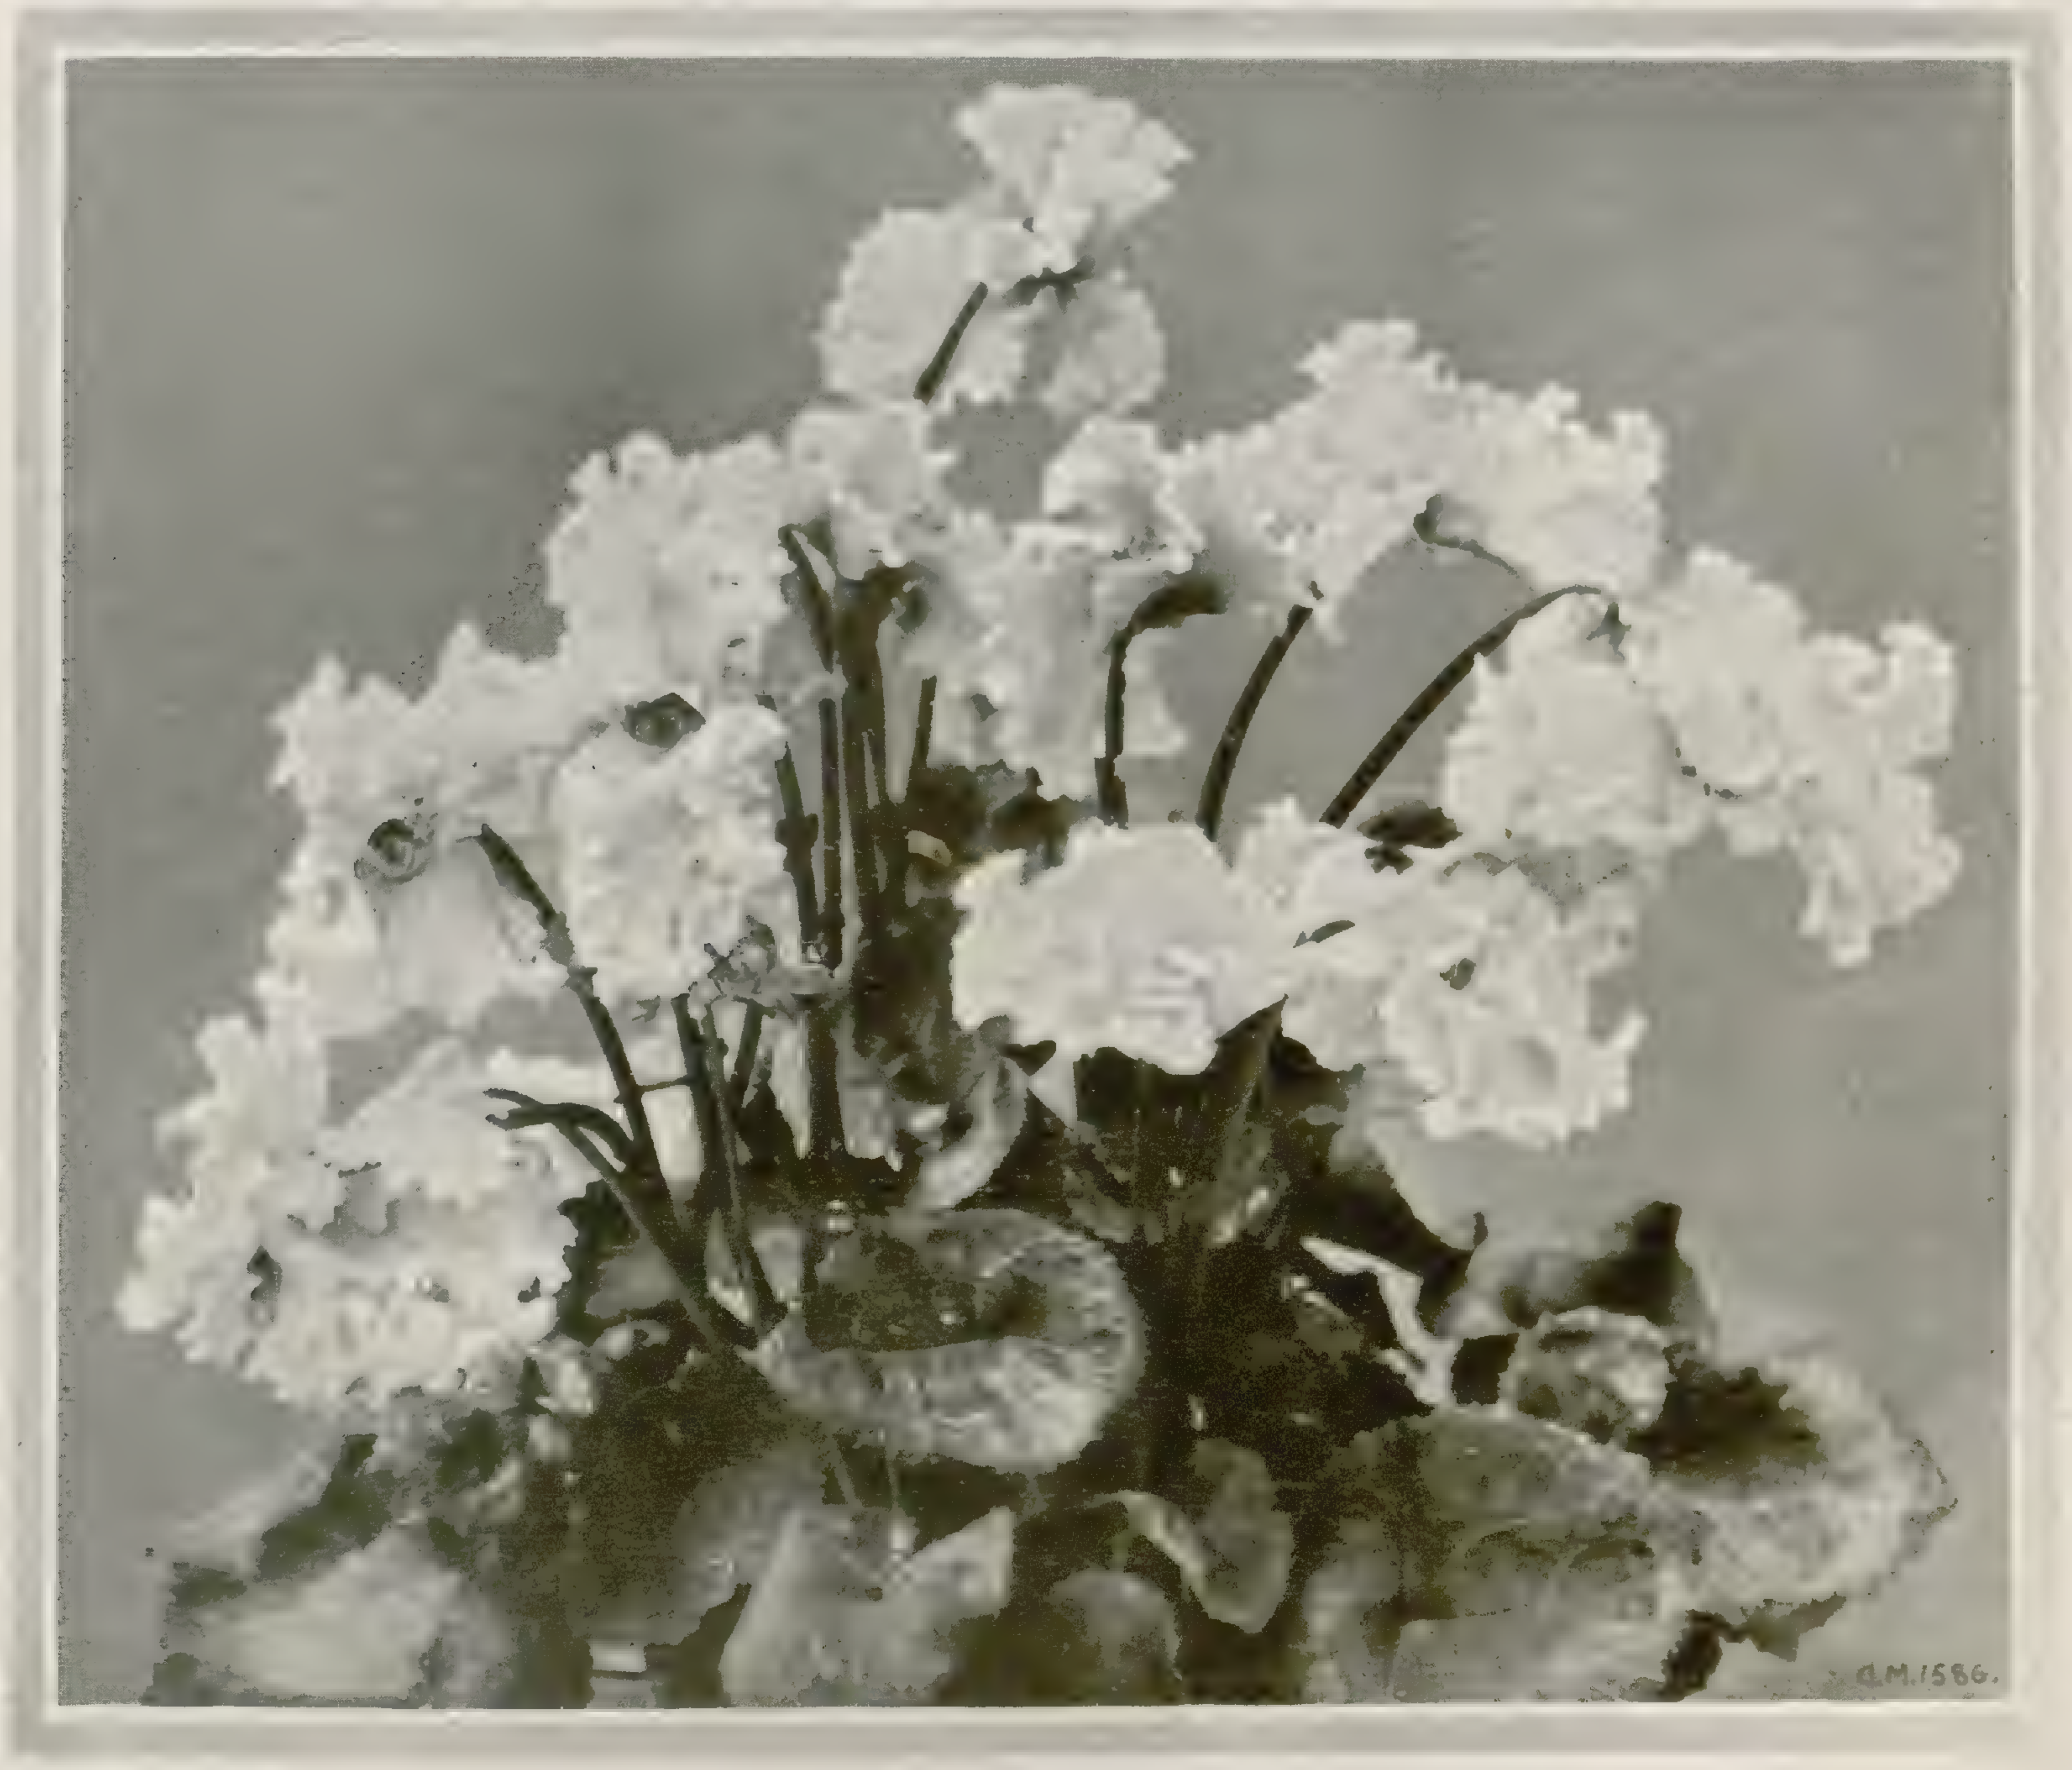
Hydrangea paniculata grandiflora.—Make a selection of the strongest and most forward of the plants that were struck last autumn. Shift them into 54's and 48's, and place in an early fruit house that has been started, so that they may receive frequent syringings. By this means an early supply of good flower heads will be obtained for house and table decoration.—A. GRUBB.

Perpetual Carnations that are carrying a quantity of blooms should have an application of some approved fertiliser with soot water at intervals. Maintain the temperature of these houses at 50 to 55 degrees, and keep up a regular circulation of fresh air by means of the ventilators. This last point cannot be too strongly advised, for it is one of the most essential points in the successful culture of carnations. When artificial heat is necessary the staging may be damped in the morning to prevent red-spider.—A. GRUBB.

NEW PLANTS, ETC.

LÆLIO-CATTLEYA CRANSTOUNÆ WESTONBIRT VARIETY.

A distinct and beautiful hybrid obtained from a cross effected between Cattleya Harrisoniana and the Walton Grange variety of Lælia tenebrosa. The flowers are of medium size, and borne on rather tall pseudo-bulbs, the sepals and petals pale soft yellow, and the lip white with red-purple markings at the apex. An illustration of this fine form was given in our issue of the 7th inst. A.M., R.H.S., January 3; Lieut.-Colonel Sir George Holford, Westonbirt, Tetbury (grower, Mr. H. G. Alexander).



CYCLAMEN MRS. BUCKSTON.
Flowers large, finely fringed, and of a rich salmon-rose colour. A.M., R.H.S., January 3; Rev. H. Buckston.

ODONTIODA COOKSONIÆ.

An attractively-coloured hybrid raised from a cross between Cochlioda Noetzliana and Odontoglossum ardentissimum. The flowers are comparatively large, of fine form, and borne in a good spike, and are rich red-scarlet, shaded rose on the lip. A.M., R.H.S., January 3; J. Gurney Fowler, Esq., Glebelands, South Woodford (gardener, Mr. J. Davis).

MILTONIA WARSCEWICZI LEUCOCHILA.

A distinct and handsome variety of one of the oldest of the species included in the genus, having been discovered on the Peruvian Andes, near Cuchiro, in 1830. The flowers are rather larger than those of the species, the petals and sepals are deep rose, edged with white, and the large lip has a crimson-purple base, and a broad margin of pure white. It was well shown by Messrs. Charlesworth and Co., Haywards Heath, at the meeting of the Royal Horticultural Society held on December 20, 1910, when, as stated in our issue of December 24, an Award of Merit was made in its favour.

CYCLAMEN MRS. BUCKSTON.

A remarkably fine form, belonging to the Papilio section of the Persian cyclamen. The plants are of excellent habit, and the flowers are large and the segments are of great breadth and finely fringed; the colour bright salmon-rose. A.M., R.H.S., January 3; the Rev. H. Buckston, Etwall, Derby.

CYPRIPEDIUM GASTON BULTEL.

A remarkably handsome hybrid with flowers of large size; the dorsal sepal is of great breadth, purple-rose, with white margin, and having crimson veinings; the petals are green tinted chestnut colour, and marked with crimson lines. A.M., R.H.S., December 20, 1910; Mr. E. V. Low, Haywards Heath.

PINUS ARMANDI.

A distinct species, which has the promise of proving one of the most handsome of the pines yet introduced to this country. There are several young trees at Kew which were raised from seeds sent to the Royal Gardens by Mr. A. Henry, who collected them at Mengtze in Yunnan, in 1897. "Bot. Mag.," t. 8,347.

CORYLOPSIS VEITCHIANA.

An interesting and attractive shrub, producing a profusion of nodding spicate flowering branches, from one to two inches in length, and bearing from ten to fifteen flowers each; the latter are pale yellow, and possess a grateful perfume. This species was collected at Chang-Yang in Western Hupeh, by Mr. E. H. Wilson, in 1900, and seeds were sent to Messrs. J. Veitch and Sons, in whose Coombe Wood Nursery it has proved quite hardy, and flowered regularly for some years past. "Bot. Mag.," 8,349.

NEOGLAZOVIA CONCOLOR.

A distinct stove plant not without attractions, although hardly of sufficient merit from the horticultural point of view to justify its cultivation otherwise than on a small scale. It is of erect growth, has narrow leaves, and bears purplish flowers set in salmon-red calyces. "Bot. Mag.," t. 8,348.

JACOBINIA SUBERECTA.

A distinct species differing chiefly from those already in cultivation in having prostrate stems, these forming a dense mass from which rise numerous erect-flowering branches. It is described as a very suitable plant for suspended baskets. The flowers are bright scarlet, and the leaves and stems are clothed by a velvety pubescens. It was introduced to cultivation in 1899 by Mr. J. Sallier. "Bot. Mag.," t. 8,350.

DENDROBIUM SANDERÆ.

A charming species, which is most nearly allied to D. Dearei, and thriving under much the same conditions as that species. It grows to a height of two or three feet, and the flowers are produced in short racemes, near the apex of the pseudo-bulbs, and are large, white with purple markings on the lip. "Bot. Mag.," t. 8,351.

Peas.—In the raising of the first outside crop a beginning may be made by sowing seed in either sixty-sized pots or wooden troughs. Many prefer small pots, sowing sufficient seed to avoid disappointment from faulty germination, attack from mice, etc. A cool frame will bring the plants along sufficiently rapid for planting out in March.—C. F.

FEEDING SPRING BULBS.

When choice bulbs are grown it is not sufficient to plant them and watch them flower, however well the ground may have been prepared before planting, for unless the soil is an ideal one for the purpose we cannot obtain the best results in this way. We should have two objects in view, the production of flowers of the largest size, firmest texture, and deepest colour, and at the same time the growth of fine bulbs for next season's display. Soils are so various that no uniform recommendations will meet all circumstances.

We will deal first with a heavy clay soil, which is one of the worst for most bulbs, notwithstanding its welcome supply of moisture and stores of potash. Its closeness of texture is one of the things bulbs dislike most, and this is accentuated by the surface running together after a heavy rain. If basic slag was not applied in the autumn it should be applied at the rate of three ounces to the square yard as soon as the tips of the leaves appear in February, and lightly worked into the surface soil. Some like to apply sulphate of potash to deepen the colour of the blossoms, but it is doubtful if this is often necessary on a clay soil, especially if it has been under cultivation for some years. When it is desired there will be no harm in applying an ounce of sulphate of potash to the square yard in the early spring. After each heavy rain the surface should be gently stirred, a pointed stick being as good as anything in a closely planted bed, and within two or three weeks of flowering half an ounce of nitrate of soda to the square yard should be given, taking care not to drop any on the leaves, and if the weather sets in dry immediately it should be lightly watered in. This will increase the size of the flowers and the depth of green in the leaves, while the soda will also set free some potash and intensify the colour of the flowers. If nitrate of soda is not at hand so early in the season good guano at double the rate will answer the same purpose, and be even better, as it supplies a complete plant food. It should always be watered in unless rain is imminent.

To soil that is light and sandy bonemeal at the rate of two ounces to the square yard should be given as early in the winter as possible, if it was not given in the autumn, and sulphate of potash at the rate of an ounce to the square yard in February, the latter being especially valuable on such soils, not only for its plant food, but for increasing the water-holding capacity of the soil. As soon as the leaves appear superphosphate of lime should be given at the rate of two ounces to the square yard, unless the soil is deficient in lime, when it is better to rely upon the bonemeal previously applied, the dressing of which may in that case be increased to three ounces to the square yard. Later, nitrate of soda should be given as recommended for heavy soils.

On a chalky soil it is of little use applying slowly-acting substances like basic slag and bonemeal, but superphosphate should be given when the shoots appear, avoiding the growing points, and lightly working it in; sulphate of ammonia at the rate of half an ounce to the square yard being given a week or two later. For such soils a mixture may be made so as to supply all needed substances at once, and should consist of two parts each of superphosphate of lime and fine bonemeal, and one part each of sulphate of potash and sulphate of ammonia, always remembering not to put nitrate of soda and superphosphate in the same compound, nor basic slag and sulphate of ammonia together. The mixture may be applied at the rate of four ounces to the square yard, as soon as the growth appears, and lightly worked in. It will keep indefinitely, and is a very useful one for general garden purposes, the action of the acid superphosphate rendering some small part of the bonemeal immediately available.

The increased vigour of growth will last the whole of the season, and, accompanied as it will be by a lasting supply of well-balanced plant-food, will enable the bulbs to store up a rich reserve for next season's growth. For bulbs in pots there is nothing superior to a solution of a good guano—a half-ounce to the gallon of water—given twice a week after the leaves are well greened.

ALGER PETTS.

PREPARING AND PLANTING PERENNIAL BORDERS.

In all parts of the country in which I find myself a keen interest in perennial plants is manifest. In the smaller establishments, the space devoted to the cultivation of these being limited, fewer plants are employed to form the groups, now so common in borders containing perennials, but in the larger places, fine bold masses are frequently met with. So pronounced is the demand for borders of this kind that shrubs are at times uprooted to give place to the more useful, and, undoubtedly, more effective, hardy herbaceous plants. These borders have been exhausted of plant food by the growth of shrubs and inattention in the way of feeding them, consequently, as is sometimes the case, if the soil is merely turned over and the herbaceous plants stuck in, the result is everything but encouraging.

As the plants are intended to remain in their positions for a number of years, ample provision should be made at the time the border is prepared to ensure a liberal and lasting supply of food for them. Much will depend upon the kind of soil to be dealt with, but in treating an ordinary loam the one aim to keep in view is to secure a good depth of a rich well-drained medium. Provided the ground has been periodically cultivated about two feet deep it is advisable to trench it, and incorporate a liberal supply of well decomposed stable manure and bonemeal, or basic slag, as the work proceeds. These should be well mixed with the soil from top to bottom, and the border allowed to stand a month or so before proceeding with the planting. In the April following the planting an application of four ounces of slaked lime and one and a-half ounces sulphate of potash should be applied to the square yard, as a surface dressing. In after years feeding can be effected by mulches of manure in autumn and early in winter, and similar dressings of lime and sulphate of potash in spring to those advised above.

To arrange the plants according to height, colour, and times of flowering, so that the border slopes from front to back, and there is an equal amount of bloom over the whole of its length throughout the spring, summer, and autumn months, it is necessary to have a plan to work from. This can easily be prepared by planning the border on paper to a scale of eight feet to one inch, and drawing lines in pencil from end to end the distance apart the plants are desired in the rows. These lines can then be measured off to any distance, and dots in ink made where the plants are to be. The pencil lines can then be removed, and lines run round the groups, and the groups numbered. By a completed plan of this sort it can be seen at a glance the relative position of each group. The first row, or line, should be one foot from the front edge of the border, the second one and a-half feet from the first, the third one and a-half feet from the second, and all other rows two feet apart. For a border that is over one hundred feet in length and seven feet in width I would allow seven plants to each group in the front row of groups, and four in the second, and four in the third. The front row of groups is formed by including six plants of the front row and one of the second. The second row of groups by including two plants of the second row and two of the third, and the back lot of groups by including one plant of the third row and three of the back one. In this arrangement the plants in the front row are only half the distance apart they are in the others, and instead of planting the front row in a straight line every alternate plant is placed three inches further into the border, to secure a better effect. Again, regarding plants, I never employ any very dwarf growing subjects in the front row, as something to cut from is what is wanted, and I find few things under one foot useful for this purpose. Where a perennial border is near the windows of the mansion it is advisable to have an edging of violas, so that a constant display of colour may be maintained from spring till autumn. Where this is carried out the violas should be planted one foot from the edge, and the first row of perennials one foot from it, with the others as stated. If the groups are allotted so that every fourth repeats itself in the time of flowering it will be found a good arrangement—thus spring, early summer, late summer, and autumn. Sometimes the display is only required for one or two of those periods of the year, and plants to bloom then only need be employed.

Perennial borders prepared and planted on these lines by one who knows his plants cannot fail to yield quantities of desirable flowers to cut from, and at the same time form an attractive, interesting, and most useful feature of the garden.

PEDESTRIAN.

Transplanting Bamboos.—The autumn and winter months being so generally recognised as the best time for transplanting most hardy subjects, it is as well to bear in mind that it is the worst period for moving bamboos. If transplanted at the above-named season the coldness of the ground militates against quick root action, and the more delicate kinds especially are apt to fall into a state of stagnation, from which they take some time to recover. The best time to transplant bamboos is when the harsh winds of spring are past, as the roots are active and the plants quickly recover from the check of removal. A very necessary point to bear in mind is that they are not allowed to suffer afterwards from want of water.—W. T.

Calceolaria deflexa.—This calceolaria is valuable for its winter-flowering qualities, as in the greenhouse its rich golden-yellow blossoms are produced for a long period during the dullest season of the year. The leaves are simple, and not unlike those of a fuchsia; indeed, the specific name of fuchsiæfolia has been applied to it. It is essentially of bushy habit, and neat flowering examples may be grown in five or six-inch pots. It is a native of Peru, and introduced by William Lobb, flowered for the first time in 1849. After that, however, it would appear to have become lost, or nearly so, till public attention was directed to it about thirty years later. It is generally recognised as one of the parents of the popular Calceolaria Burbidgei.—W. T.

LILIUM UMBELLATUM.

Although possibly not equal in beauty to some other of the lilies that could be mentioned, Lilium umbellatum and its varieties have strong claims upon cultivators, and especially upon those who for various reasons are unable to provide special positions and composts for the hardy plants to which they devote their attention. The umbellate lilies have the advantage of possessing a robust constitution, as well as being perfectly hardy, and, consequently, can be planted without apprehensions as to growth or flower production, provided the beds or borders occupy a fairly open position, and the soil is moderately deep and rich. In other words, they may be planted where herbaceous plants generally are known to thrive, with the full assurance of their making a satisfactory growth, and producing finely developed flowers. They have also the advantage of being distinct and effective in colour.

AN EFFECTIVE BED OF UMBELLATE LILIES AT KEW.

This being the case, there is no occasion to dwell upon their merits, or to refer otherwise than briefly to their cultural requirements. They may be successfully grown in beds and borders, but in private gardens, and particularly those of moderate size, the preferable course is to plant them in borders, because when so grown the blanks that occur when they have passed out of bloom are not conspicuous. They are immensely attractive when grown in large beds, as in the case of the fine bed herewith illustrated, that is annually so effective at Kew. But in these great gardens there are so many features that a bed which has lost its season's charm does not specially attract attention. If it is desired to grow these lilies in beds they may be planted much less thinly than in the bed illustrated, and the intervening spaces be filled with some other plant ranging from twenty-four to thirty inches in height, and producing flowers that in colour will harmonise with the lilies. In border culture the best results are obtained by arranging the lilies in groups, each containing from four to six bulbs, and consisting of one variety. The front row will be the best position for them, and from six to eight feet will be a good distance at which to put the groups apart.

It will be an advantage if the soil is sufficiently rich to render manurial applications unnecessary. Should it be somewhat exhausted add a liberal dressing of leaf-mould or other well-decomposed vegetable refuse, and bone superphosphate, the last-named to be applied at the rate of two or three ounces to the square yard. Then dig deeply, and in the process well mix the fertilising materials with the soil.

The following comprise a few of the finest forms: Erectum, bright red, shading to yellow; Incomparable, rich crimson, freely spotted; Sappho, orange-scarlet marked with a few spots; and Tottenhami, yellow, spotted with crimson. The bulbs may be successfully planted at midwinter, but there must not be any unnecessary delay.

G.

Plumbago rosea.—While most of the species of plumbago have flowers either white or of some shade of blue, this warm house species has bright rosy-scarlet blossoms. It is a very old plant in gardens, having been introduced from the West Indies as long ago as 1777. Its decorative value is enhanced from the fact that it may be so grown as to flower during the autumn and winter months, at which time it is particularly valuable. There is a variety, coccinea, with larger and brighter coloured flowers. Both can be readily struck from cuttings of the young growing shoots in the spring, and they grow away freely afterwards.—W. T.

JUDGING SWEET PEAS.

The following is the text of the paper read by Mr. Walter P. Wright, F.R.H.S. (chairman of the N.S.P.S. Floral Committee), at the recent conference held by the National Sweet Pea Society:

A judge of sweet peas has a different, and in my opinion a more difficult task, as compared with a judge of roses, chrysanthemums, dahlias, carnations, or indeed any other popular florists' flower.

In the first place, it is customary to set up sweet peas in vases, each variety being represented by a number of stems. In the case of the other flowers named it is usual to show one flower only of each variety. It is true that sprays of garden varieties are sometimes shown, but they are in minor classes, and as a rule the number of specimens is so small, and the arrangement such, that all the flowers can be seen at a glance.

There is certainly no parallel amongst other leading florists' flowers to the sweet pea, with its twenty or so stems per vase, and its three or four flowers on each stem. For this reason, we who specialise in what from the exhibition point of view is a new flower cannot turn for guidance to the rules or principles of other florists; we have to work out our own salvation.

There is another reason why the judging of sweet peas is different from that of other flowers. In practically all the principal colours we have two types: the plain or grandiflora, and the waved or Spencer. Many of the varieties are identical in colour; they only differ in form.

Given twenty-four varieties of roses or chrysanthemums, a judge has twenty-four specimens to examine in order to make sure that there are no duplicates. Given twenty-four varieties of sweet peas he has, in the ordinary way, 480 specimens to inspect. Any one of the twenty sprays in any one of the twenty-four vases may be a plain where it should be a waved, and if there is one the exhibit is liable to disqualification.

The difficulty of giving correct awards is increased by the absence of guiding principles as to (1) length of stem, (2) allowance of haulm or otherwise, (3) disposition of the flowers on the stem, (4) size, (5) freshness. Judges follow a go-as-you-please course, and are swayed by individual tastes and preferences. One attaches paramount importance to length of stem and size of bloom, another to freshness. Others never trouble to see whether there are plain and waved flowers in the same vase. One of our friends told me that on disqualifying a competitor for mixing plain and waved flowers the latter smiled sweetly, and, quite unabashed, remarked that as he had "tried it on" successfully with several judges previously, he thought he might as well take his chance again!

The greater the difficulty in judging sweet peas, and the greater the confusion as to principles, the more necessary it is that the problem should be faced, and I think that the time has come for the National Sweet Pea Society to take action, with the object of establishing an authoritative code. In order to further this, I propose to set out the principal points, and give opinions thereon, with a view to inciting discussion. I suggest that when the debate closes a set of rules for judging be drawn up, representing the collective wisdom of the society, and that they be printed in the society's publications and pressed on the attention of affiliated societies.

(1) **Haulm.**—In my opinion, one of the first rules laid down should be that stems are really to be flower stems, and not haulm. The inclusion of haulm attached to the stems should disqualify.

(2) **Number of Stems.**—In exhibiting a given number of roses, chrysanthemums, or carnations, it is usual to use perforated boards, so that it is a simple matter to get in the right number of blooms and no more. It is wholly different with sweet peas. The use of movable vases on tables or stages makes the task of counting more onerous, and if to this is added the obligation of counting, say, twenty sprays into each vase, the task is a serious addition to that of choosing stems and arranging vases. For this reason I believe in stating twenty sprays as an approximate number, with the warning that crowded vases will be passed over. Few, if any, judges pretend to count the contents of vases. In judging a show it is my custom to state at the outset that I do not intend to count, as this would waste valuable time that ought to be given to judging alone. Time devoted to counting is time taken from judging. As things are, if a mistake is discovered it is generally at the instance of another competitor, and inasmuch as it is almost impossible to count the contents of a vase without handling the stems, the way is open for substitution, subtraction, or addition. For these reasons I am opposed to a fixed number being stated. Nor do I think that a rigid rule is necessary in order to prevent awards being influenced by quantity rather than quality. A judge who has a good code to work upon, and a mind of his own, is not likely to be influenced by mere numbers.

(3) **Wiring.**—The use of wire to mount the stems should disqualify.

(4) **Mixed Types.**—Judges should be warned to look out for cases of plain and waved flowers being mixed in a vase of one variety, and to disqualify when found.

(5) **Length of Stem.**—Inasmuch as stems are sometimes staged 2 feet long, with the flowers straggling along them, and showing wide gaps, it might be wise to consider a suggestion that stems 18 inches in length are quite long enough to make an effective vase.

(6) **Number and Disposition of the Flowers.**—The stems should carry threes or fours, the flowers should face one way, and should be near enough together to form a homogeneous set. Long stems, with large flowers widely separated, should be discountenanced. This is not a case for disqualification, but for showing, by the choice of neater, more refined specimens for the prizes, that coarse examples are not appreciated. At present judges differ widely in this particular, and many, who at heart disapprove of coarseness, are afraid to ignore the giants because of the criticisms of the crowd. The public, however, would soon become educated up to an appreciation of genuine quality.

(7) **Freshness.**—Great stress should be laid on staging young, fresh flowers. Judges should be instructed that old flowers, however large, ought to be passed. If some vases are young, and some old, points should be deducted from the latter.

(8) **Spotted Flowers.**—Speaking broadly, clean flowers are desirable, but I think that young flowers which are merely spotted by a shower should be penalised less severely than blooms that are curling and discolouring from age.

(9) **Blending of Colours.**—Judges might be taught with advantage that as the artistic arrangement of colours is desirable, a stand in which the colours are well blended might, other things being equal, carry the award over one in which the colours are not well arranged. Colour-blending should not, however, carry inferior flowers to victory.

(10) **Double Standards.**—I think that double standards should be regarded as defective, on the ground that they mar the symmetry and harmony of the flower.

Procedure for Judges.—I think that the following might be suggested as good procedure for judging sweet peas:—

(a) When starting, count the exhibits in each class with the secretary's assistant, to make sure none is omitted.
(b) Count the number of vases.
(c) See that the exact number of varieties specified in the schedule are present in each exhibit.
(d) Make a preliminary survey, and rule out those stands that are palpably defective, in order to be able to concentrate attention on the eligibles.
(e) Look through the vases in the selected stands for mixed types.
(f) Make the awards on freshness, number of flowers per stem, size of flowers, disposition, and blending of colours. Compare vases of the same varieties side by side.
(g) Take a final look over, to make sure that there is no oversight.
(h) Mark 1st, 2nd, or 3rd on the back of the exhibitor's card.
(i) Be blandly unconscious of the subsequent decisions of the defeated competitors and "the Man from the Street," but give courteous attention and explanation to any inquiry made through the executive.
(j) Invest your fees in new varieties for the following year.

As a concise summary, I would suggest the following scale of points:—

Qualities.	Points.
Freshness and good colour	6
Number of flowers per stem (three to four)	4
Length of stem (approximately 18 inches)	4
Arrangement of flowers on stem ...	4
Size of bloom (approximate width of standard 1¾in.)	4
Colour-blending	2
Total	24

What Vegetables to Grow.—With the beginning of the year, one of the first matters to be seen to by the kitchen gardener is to select and purchase the seeds for the season, both the quantities required, and the varieties of the various crops that it is intended to grow. Seedsmen, and hybridists in general, are very progressive, and improvement is seen each year, both in the selection of stock and in new varieties. Beginners will do well to keep mainly to the well-tried kinds and experiment only with novelties as supplementary sowings to the main crops. If the new arrivals prove worthy of an entry to the main list, they can be included next year.—C. F.

DEEP CULTIVATION.

My thanks are due and freely given to Mr. Beckett for the tone of his remarks on this subject in answer to my criticisms of the methods adopted by some of the exponents of the "turn out the bottom" method, as opposed to the opposite system.

My contention is that so great a depth of good soil is not required as from three to five feet; not for vegetables even, and certainly not for fruit trees. It would, indeed, be a step in the wrong direction, because in the latter case the roots should be nearer the surface for the purpose of wood ripening, as is generally admitted. This is a strong point in my argument against placing the better-prepared soil at the bottom of the trench as an encouragement to the roots to go down in quest of nutriment. The more we discuss the method of trenching the more we shall learn of other people's ideas, and at the outset I would say I am writing for the information of beginners, who have had no previous experience. I know how difficult a subject this is to the great army of amateurs and cottagers; the former, who live in the suburbs of a town, and the latter with their few rods of allotment ground where it is not possible to collect materials for improving the surface soil, no matter how small a quantity is required. If I had simply in view Messrs. Beckett, Gibson, Ellwood, and other growers of vegetables of a similar rank, I should write differently. I have seen rose beds trenched on Mr. Beckett's plan, and in stiff, cold soil, and I have seen as the result most unsatisfactory growth. The leaves quite yellow all the summer, and the plants in a most deplorable condition for a whole season, because the subsoil brought to the top was of such an ungenial character that the roots could not make progress in it, the condition of the roses being aggravated by a spell of dry weather during the summer. I have also seen plots in which winter greens absolutely refused to grow for the first season.

If it were possible this trenched land could lie for a whole season and become ameliorated by the weather, then all might be well. But where the land that is trenched must of necessity be cropped at once, then the method is altogether wrong.

I do not dispute that Mr. Beckett can prove he can produce satisfactory results. I know well enough, as indeed do all readers of the GARDENERS' MAGAZINE, that he can, and indeed does, obtain results which I feel justified in describing as little short of marvellous. But that is not my point; it is not what he does with supplies of burnt refuse, etc., but it is what those who are not so well situated can do. It is in these I am the most interested. In Mr. Beckett's case he takes steps to improve the soil to its full depth at once. I advise a similar improvement by degrees, at the same time not hindering any crop or entailing much trouble or expense in arriving at that end. Mr. Beckett aims at improving the subsoil at once by bringing it to the surface and adding foreign matter to it for the purpose of sustaining the growth during the earlier stages. I complain because he and others who adopt the same practice give no reason for their method of manipulation beyond the desirability of getting the soil into working order as soon as possible. They should know that the classes of cultivators whom I have in view are powerless to carry out such practice. I tell my pupils that the deep-stirring or moving of the hard pan of subsoil a yard below the surface affords a means of quick percolation for the surplus water from heavy rains, which in the autumn and winter is most detrimental to broccoli, etc. Again, deep cultivation renders the soil so much warmer by the ingress of air, and what is of much importance this deeply-moved soil conserves moisture so much more readily during a spell of dry weather. All of these advantages my method obtains, and what is of supreme importance, the existing crops are not handicapped by ungenial soil conditions on the surface.

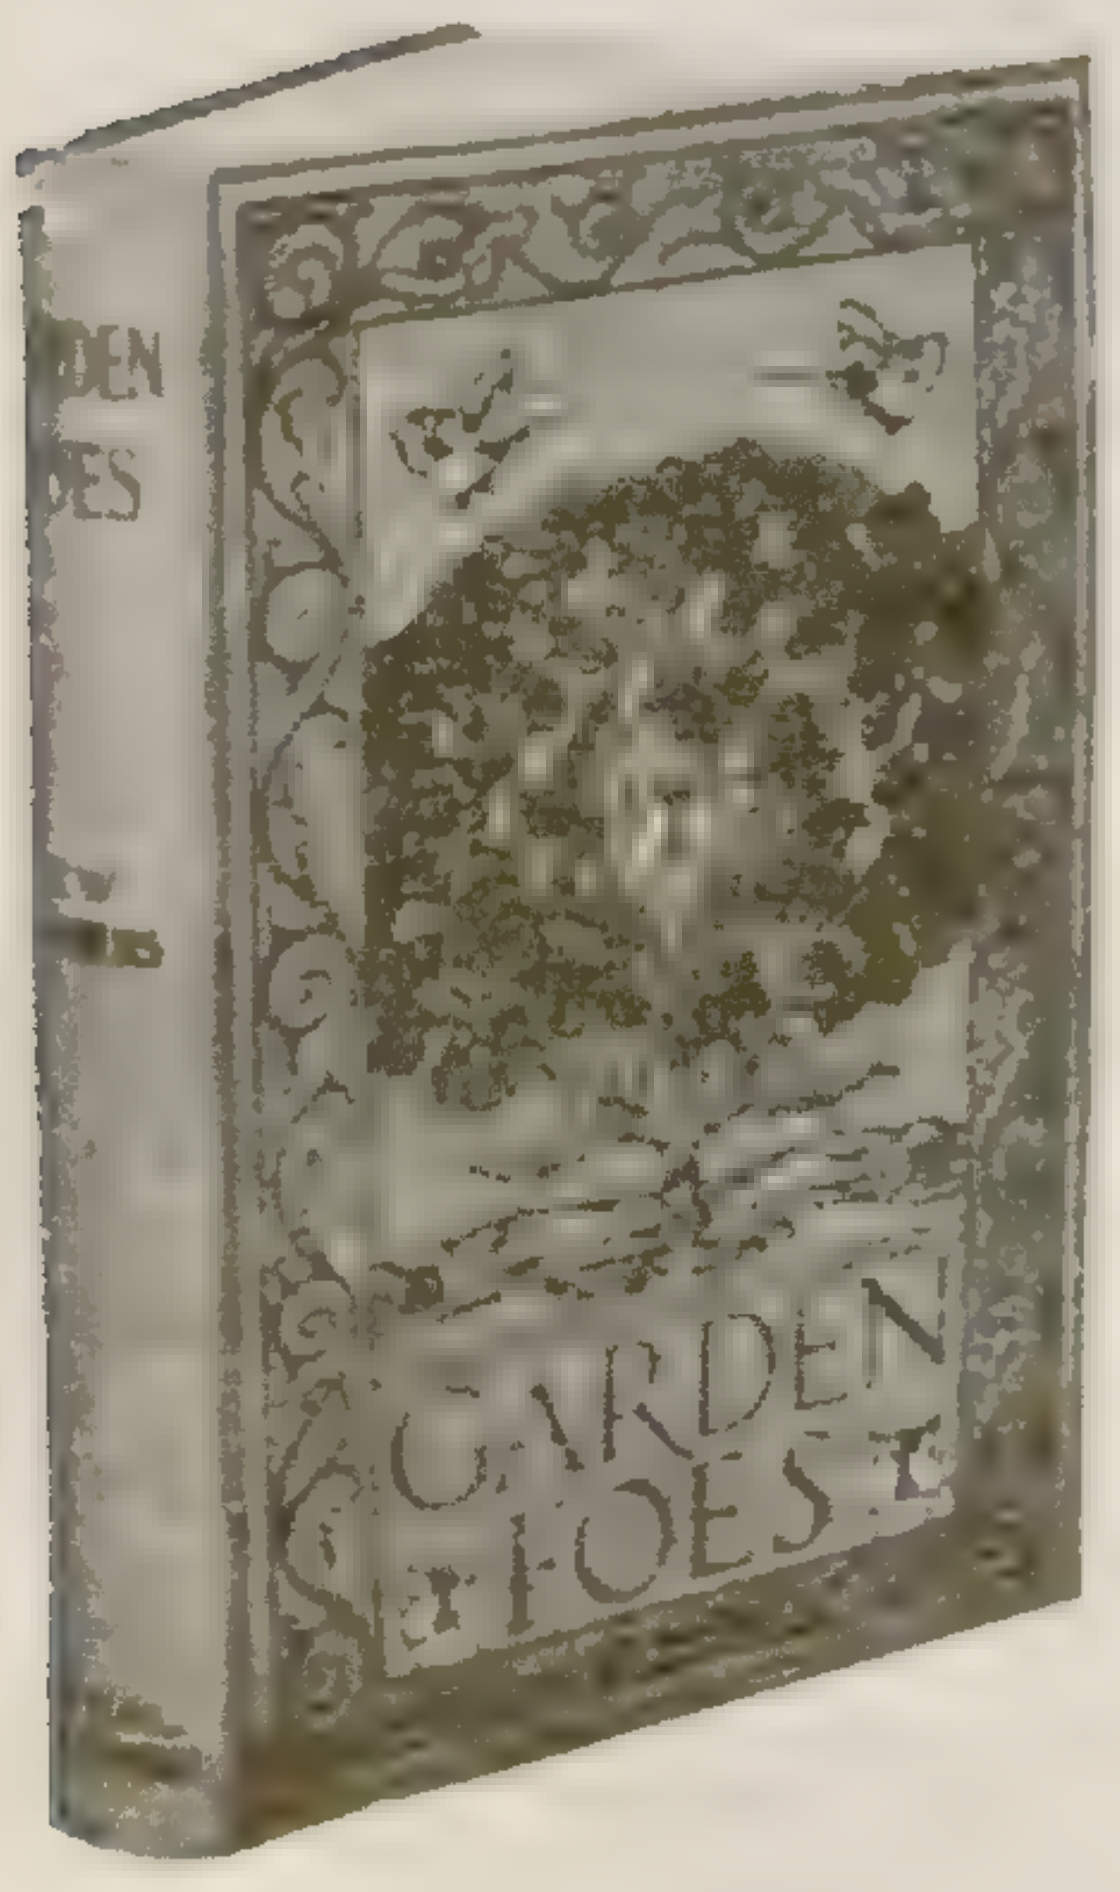
GARDEN FOES.

336 PAGES.
150 Illustrations

By T. W. SANDERS, F.L.S. (Editor of "Amateur Gardening.")



A description of Insect, Animal and Fungoid Pests injurious to Fruit and Vegetable Crops, Hardy Plants, Trees, Shrubs, and Greenhouse Plants, with all the latest Remedies for their Eradication, etc.

CONTENTS:

- Fruit Pests and Diseases.
- Vegetable Pests and Diseases.
- Flower Garden Pests and Diseases.
- Greenhouse Pests and Diseases.
- Forest Tree Pests and Diseases.
- Rose Pests and Diseases.
- Miscellaneous Pests, etc.
- Insecticides and Fungicides.
- Insecticide Formulas.
- Proprietary Insecticides and Fungicides
- Spraying Apparatus.
- Powder Distributors.
- How and When to Spray.
- Fumigating.
- Cyaniding, etc., etc.

ORDER FORM.

To the Publishers of "THE GARDENERS' MAGAZINE," 148 & 149, Aldersgate Street, London, E.C.

Please send me a copy of **"GARDEN FOES"** *by Post, for which I enclose remittance of* **2/10**

Address..

SCHIZOCODONS.

In the GARDENERS' MAGAZINE of December 31, 1910, Mr. S. Arnott writes graphically and sympathetically concerning Schizocodon soldanelloides, which has not as yet established itself in any great degree in our English gardens. Notwithstanding this, I hope in the near future to meet ample colonies of it in those gardens where it is possible to devote the maximum of time and attention in the naturalising of this most charming subject. We have the shortias establishing themselves freely, and as the plants are closely allied (the synonym of the schizocodon being Shortia soldanelloides), surely with a little closer study of its needs we ought to have the schizocodon doing likewise. Mr. Arnott's description of the failure of a host of healthy plants to withstand the summer heats of Yokohama suggests that importations should be made during the cool months of the year. This exactly corresponds with the "modus operandi" of the best Japanese nursery firms, who forward practically all goods during the winter and earliest spring months.

In dealing with the schizocodon one should realise that it is essentially a mountain plant, and, consequently, it should do better in a bracing hilly district than in the more humid lowlands. It occurs abundantly in Central and Northern Japan, both in the tree, shrub, and grass regions, ranging in altitude from 5,000 to 8,000 feet. The fact that it inhabits both tree and shrub regions on the Japanese hills points to the fact that a sunny exposure is not necessary for successful culture, but in connection with this point may I add that it is stated to grow freely on exposed hillsides in Yamashiro and others districts.

I would venture the opinion that for English gardens root protection is a greater necessity than an ultra-shady position. Could we but reproduce the natural environment of this little plant with its roots protected by the carpet of grasses and small plants, thus guarding both against drought and excessive moisture, we should possibly make greater cultural advances in its favour. This leads one to the suggestion that a grassy bank in the wild garden might suit it better than many rock garden positions, though even then it would need watching lest it should be overgrown by strong grasses.

If grown in the rock garden the soil bed should be deep enough to retain moisture during summer, and a light carpeting growth of some fairly small creeping plant should be permitted to wander among the schizocodons. Its flowering season in Japan is June and July, and in addition to the form under discussion there is the variety alpina, which possesses foliage more deeply serrated than the type, and is usually found on higher levels. In addition one may note Schizocodon ilicifolia, which is probably a varietal form of soldanelloides. This is readily distinguishable from the foregoing, as the foliage is hardly as broad, or as rounded, and the indentations around the margins are deeper, giving the foliage a miniature holly-like appearance. The blossoms are like those of soldanelloides in form, but are usually white, though occasionally one may note reddish-hued flowers upon some plants, showing that ilicifolia is subject to a diversity which is not unpleasing.

It may be mentioned that the plant under notice is apparently more restricted in its distribution, for it seems to be practically confined to the wooded hillsides of Central Japan, and this fact may account for its rarity in gardens at the present day. The fact that there are hosts of good rock plants awaiting the collector on the uplands of Japan will perhaps be better appreciated in a few years' time than at the present moment. P. S. HAYWARD.

STRAWBERRY LEAF SPOT.

In a recent issue of the "Journal" of the Board of Agriculture, attention is once more drawn to the fact that both cultivated and wild strawberries are often severely injured by a fungus called Sphærella fragariæ, Tul., better known in this country as Ramularia Tulasnei, Rab., a conidial form of the Sphærella, and for a long time the only known condition of the fungus. The foliage is the part attacked, and the symptoms are unmistakable. Small reddish-brown spots appear on the leaves; these often encroach on each other and form irregular patches. By degrees the centre of each patch assumes an ashy-grey or whitish colour, bounded by a reddish border, which becomes bright red later in the season. This peculiar arrangement of a whitish spot bounded by a red ring has given origin to the local name of "Birds' Eye Spot" in some parts of the country. The central whitish portion of the patch soon becomes studded with minute tufts of the conidial or Ramularia condition of the fungus. These continue to infect healthy leaves throughout the season. When the infected leaves begin to languish the conidial condition is followed by the higher or Sphærella condition of the fungus, the spores of which remain on the dead leaves until the following spring, when they are liberated and infect the young leaves.

This pest is everywhere present in this country, and is also well known on the Continent and in the United States. None of the cultivated varieties escape the disease, but some are more severely attacked than others. The variety called "Royal Sovereign" is especially susceptible to the disease. When the injury is severe the crop of fruit is much reduced both in quantity and in quality; the plants are also weakened for the following season.

If spraying is commenced at a sufficiently early stage (in fact, where the disease has previously existed spraying should commence when the leaves are quite young) an epidemic may be prevented. The plants should be sprayed with a solution of potassium sulphide (liver of sulphur) in the proportion of one ounce to three gallons of water. This treatment will also arrest the possible appearance of strawberry mildew, Sphærotheca humuli. Spraying should be continued at intervals until the flowers begin to open.

The following method of combating the disease has proved highly satisfactory when strawberry beds are badly rusted. The beds should be mown soon after the fruit is gathered, covering the dry leaves with a sprinkling of straw or dry litter and burning them. This may seem harsh treatment for the plants, but everyone who has tried burning over a strawberry bed has been surprised by the vigorous and healthy appearance of the new foliage.

Southampton Horticultural Society.—The report of this society that was presented by the council to the members assembled in annual meeting on Monday afternoon was of much interest as evidence of the excellent work that was accomplished during the past year. The society held three exhibitions, all of which were of a high order of excellence, but unfortunately the attendance of the public at each of them was disappointing, with the result of the council being compelled for the first time for some years to bring forward a few liabilities into the current year. The number of members has, we are pleased to learn, been increased, notwithstanding the unusually large number of losses from deaths and removals.

CLIMBING AND PILLAR ROSES

There are very few purposes to which roses can be put that are more pleasing and effective than as climbers or the clothing of pillars. Over arches and arbours, also, few subjects are more suitable and charming. But one must select the right varieties and have properly prepared ground for their growth. With so much to support this is even more essential than when cultivating the dwarfs of normal growth. It often happens also that the ground near to and around porches, etc., is used as a pathway. Although we often see plants doing remarkably well under such conditions, it will generally be found they are naturally strong-constitutioned varieties, but with a little attention to preparing the soil many of our more chaste and somewhat delicate roses might be used to advantage.

It is not so much the individual flowers as the general effect of the whole. Nor is it well to aim too much as to uniformity of growth, or to tie them in too closely. A looser and more rambling style is often the most pleasing, and nature has a happy way of placing the branches and trusses in the most artistic manner, so that the control absolutely necessary to make things secure is all that need be given. The beautiful effects frequently seen upon porches over cottage doors in the country are not often aimed at by the occupiers, but come naturally through the plants being allowed more freedom of growth than is often the case in gardens of some pretensions, and I think there are few instances where naturally-grown plants are seen to more advantage. In either case anything formal detracts from the effect.

Oftentimes the pruning knife is at fault, cutting away straggling shoots of young growth, instead of thinning out indifferent wood and removing all that is dead or declining. This would give more room for the healthy maiden growths that are the most valuable part of the climbing and pillar roses. Overcrowding and tying the growths in a mass cannot prove satisfactory, and there is far more bloom, as well as better quality and effect from maiden growths that have room to develop. If allowed to become crowded much dead wood results, and there is a greater tendency to become bare towards the lower part. It is not climbers upon walls or fences that I am alluding to in this note; but those used to cover outbuildings or the corners of some such structures as the hen or wood house may be treated similarly, while the same varieties recommended for arches and porches are suitable, and may be of some little service as regards this season's planting. A few of the best of the tried roses are mentioned below.

Whites.—Aimée Vibert, Felicité Perpetué, and White Dorothy Perkins. Pinks.—Dorothy Perkins, Minnehaha, Pink Roamer, and Cheshunt Hybrid. Crimsons.—Reine Olga de Wurtemberg, Ards Rover, Crimson Rambler, and Delight. Yellows.—Alister Stella Gray, Gardenia, William Allen Richardson, and Claire Jacquier. Buff and Salmon-orange.—Gloire de Dijon, Bouquet d'Or, Rêve d'Or, Réné André, Evergreen Gem, and Elisa Robichon. These are more suited for arches and porches. For pillars I would prefer Papillon, Climbing Caroline Testout, Gruss an Teplitz, Wallflower, Purity, Frau Karl Druschki, Crimson Rambler, and Ards Rover. The last two are equally suitable in either position, while Madame Alfred Carriere is one of the all round roses it is difficult to misplace. A. P.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEED SOWING.—With reference to the sowing of orchid seed, it has been considered advisable to defer the sowing of a portion of the seeds from the capsules that have ripened during the closing months of the year until after the turn of the days. In the case of odontoglossums and allied cool house genera it will generally be found that germination is exceedingly slow during the closing months of the year, but it is remarkable how rapid is germination of early-sown seed during the present month, and later on. The examination of the seed beds will enable the cultivator to determine the desirability as to whether further sowings are necessary, and if they are, they should be made without delay. Some of the seed may be thinly sprinkled over the old seed beds of previous sowings, but if the germination on these seed beds has not proved satisfactory, it is desirable to select some fresh ones. There is an unexplainable fact that we may sow on a number of seed beds and find, in the majority of cases, that it is only on a limited number that germination is satisfactory. It is therefore advisable that, however limited the quantity of seed may be, we should endeavour to sow it on two or more seed beds.

SELECTION OF SEED BEDS.—There is more in selecting suitable seed beds than in anything else, to successfully raise odontoglossums and their allied genera. If fresh-potted plants are selected, we find that a considerable settlement takes place, and as the plants in the pots have to be considered in the application of root moisture the surface of the material does not lead to the most satisfactory germination. On the other hand, where the compost is much decomposed, we find that, after stripping the surface of any growing substances, it quickly becomes close, and ultimately turns sour and unsuitable. The most satisfactory seed beds in my experience are the surfaces of the material in which plants of their own kind are growing, preferably plants which were potted some weeks previously, or surfaces that were prepared some weeks before they were required for seed sowing. Care must be observed to remove any robust growing heads of sphagnum moss, or the growth of algæ on the surface of the potting compost. This is most important, as the seedlings are naturally slow growing, and any mossy growth on the surface will have a tendency to outgrow the young orchids, and seriously interfere with their development. It is a most difficult matter to remove anything from the surface of the seed bed without disturbing the germinating seedlings. Previous to sowing water thoroughly with rain water, and, after allowing them to drain for a few hours, sprinkle the seeds thinly and evenly over the surface, taking care that goodly numbers fall about the base of the pseudo-bulbs and exposed roots, where the germination is usually more rapid.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CLEANING CONSERVATORY. — The majority of chrysanthemums are over, and it will be found very convenient to give the house a thorough cleaning before introducing fresh plants. Pay careful attention to the staging. Whatever material is used for covering the stage, either granite chippings, shells, or gravel, it should all be removed and thoroughly washed to ensure a perfect drainage from the stage. Prune, clean, and topdress all creepers as required, paying attention to the drainage if in pots.

CHRYSANTHEMUMS. — Cuttings in frames should have a little air for an hour or so each day when possible to prevent damping. On bright days spray the plants lightly with tepid water and close early.

CINERARIAS.—The most forward of the large-flowered varieties may be removed into a slightly warmer house. If specimen plants of the stellata type are required, the best should be shifted into larger pots, using a compost of good loam, leaf-soil, sand, and mortar-rubble, adding some manure from an old mushroom bed. Pot firmly to ensure sturdy plants. At all times keep a strict watch for greenfly, always remembering that "prevention is better than cure." Water carefully, but do not let the plants become dry at the roots.

FREESIAS AND LACHENALIAS are making steady growth and may with advantage be given a little weak liquid manure. Place a few of the most forward in a gentle heat for successive flowering.

MALMAISON CARNATIONS.—The main batch of these plants is still practically dormant, so that strict attention must be paid to the watering. It is far safer to keep the plants on the dry side until the days become warmer and root action is more vigorous. Carefully examine the foliage for rust, and keep down thrip and spider by fumigating at intervals.

BULBS AND FORCED SHRUBS.—A regular supply of flowers may be obtained by placing batches of these in heat at intervals of ten days or a fortnight. Lilacs, Azalea mollis, Deutzia gracilis, Prunus triloba, and Boronia megastigma and B. heterophylla are among the many hardy and greenhouse shrubs that force readily, and make fine subjects for the conservatory if placed in a cooler house just before coming into flower.

TUBEROUS BEGONIAS. — Sow seed of these, using a compost of loam, peat, and leaf-soil, with a good sprinkling of sand. This should be passed through a fine sieve, and well watered before sowing. After sowing cover the seed pan with a square of glass, and put in a structure with a temperature of 60 deg. Do not allow the soil to become dry, or failure will result.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

RENOVATION OF OLD FRUIT TREES. —Moss on fruit trees may be caused by the soil being poor and exhausted, and a good dressing of farmyard manure will be highly beneficial to such trees, with a spraying with caustic soda wash some time during the next month or so. This dressing will do much towards bringing the trees back to a healthy state. The best method is to clear the soil three or four inches deep from around the trees, and apply the manure three or four inches thick. It will not matter if the latter is a little fresh, provided it does not come in direct contact with the roots. In the application of manure at any time always aim at spreading it well over the area occupied by the roots. If this method were adopted more frequently in the management of old fruit trees throughout the country, and a little more readiness shown in grafting trees of useless varieties, we should soon be able to largely increase the supplies and hold our own as fruit-growers.

GRAFTING.—Old trees may be headed back any time now, ready for grafting when the bark runs freely in March. In heading back large standards it is not advisable to cut the branches off very close to the stem of the tree. The main branches may be left from five to seven feet in length, as more grafts can be put on, the wounds are not so large, and consequently heal over sooner. Moreover a large head is formed, and naturally a larger yield of fruit in the same given time. Scions that are being saved for use later on should be carefully labelled, tied in bundles with their base quite even, and plunged six inches deep under a north wall or hedge, where they will remain quite dormant until required.

NAILING AND TYING. — All trained trees in the open quarters and on walls, excepting peaches and figs, should be tied or nailed in after the pruning is finished at this time of year. In tying the larger branches use good stout string, and wind it round the wire, two or three times, from underneath. This procedure will prevent the bark coming in contact with the wire. All unnecessary wires should be removed from wirework in the open, as they frequently cause chafing and wounds, and severely impair the health of the trees.

ROOT PRUNING.—It often happens that fruit trees produce an enormous lot of wood and leaves, and comparatively little, if any, fruit. Where that is the case, and root pruning will be advantageous, providing the soil is still workable there is yet time for it to be successfully carried out. A trench two feet wide should be taken out round the tree, and from two to four feet from the stem, according to size of the tree. Cut all roots about six inches from the ball, and undermine as much as possible for the purpose of cutting the tap roots. Then return the soil in thin layers, and ram as tightly as possible. A good mulch of stable manure should be applied in May or June. Some varieties of apples only fruit every alternate year, so it is well to know the trees for at least a couple of years before commencing to root prune them. I find that if naturally shy bearers have all their side growths pruned as soon as the fruit is gathered, many of them will fruit the following year, but not heavily.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

FORCING.—If the forcing ground is in order, and the fermenting material in readiness, proceed to make up hotbeds for potatoes, carrots, radishes, etc. The main point in carrying out this work is to use thoroughly shaken-out and sweetened manure, and incorporate plenty of leaves with it, treading the mixture evenly and very firmly as the bed is formed, this being necessary for the purpose of retaining a mild and lasting heat. After fermentation has well set in, the beds should be soiled over. Use rather light and porous soil for these early crops to the depth of nine to twelve inches. Brick-pits are much to be preferred for these beds, but if not at command, with care good results can be obtained from garden frames.

CUCUMBERS.—Sow seeds of these singly, using a light compost in thumb-sized pots, and plunge them in bottom heat of 75 to 80 deg. A rather low light house is the most suitable for the growing of cucumbers, as an equable and humid atmosphere can be maintained much better than in loftier houses. Shift on the plants as they require root space, and grow them near the glass with a humid atmosphere and a temperature of 70 to 75 deg. to a suitable size for planting. Lockie's Perfection is a very suitable variety to grow for a private establishment.

CAULIFLOWERS. — Make a sowing at once to secure early plants, using pans or boxes filled with sandy soil. The young plants are subject to damping off in their seed receptacles, hence the need of sandy soil and also early pricking off into small pots as soon as possible after they attain their proper leaves. A position in an early vinery or peach house is suitable until the plants are established. Afterwards they are best in a cool frame, well up to the glass with air admitted according to the outside weather conditions. On no account give the young plants a check to their growth.

LETTUCE. — A small sowing should be made of an early cabbage variety, such as Golden Queen or Early Paris Market. The young plants should have a temperature of about 50 deg., and, when they are large enough, prick them out in a frame over a mild hotbed in sandy soil. Very little air will be necessary until the plants commence active growth, and then more may be admitted according to circumstances.

MANURING AND DIGGING.—The wheeling on of manure, trenching, and digging, owing to the wet condition of the land, will, in many cases, be much in arrears. There is nothing gained in working, stiff ground especially, when charged with heavy rains, and it is better to push on other work necessary, and leave the digging until suitable weather arrives. — C. Flack, Cholmondeley Castle Gardens.

ASPARAGUS.

Asparagus is a favourite crop in this country; it is one of the earliest of spring vegetables, and presents little cultural difficulties to the grower in ordinary soils and localities, provided careful attention is paid to detail. Indeed, a plantation of "grass" may be made in most kitchen gardens if one is willing to exercise some care in planting, supplying liberal nourishment, and keeping the crop as clean as possible. Naturally, the first important essential is a friable and well-drained soil, otherwise the crop is a difficult one to manipulate. At the same time, its special requirements seem to be very well suited in a variety of soils; in the strong rich soils common to the lias formation in the Vale of Evesham, for instance, asparagus is a particularly successful crop. The methods adopted in this locality are generally confined to row culture, the rows being from three feet to three feet six inches apart; occasionally the crop is grown in narrow beds containing two rows, with a wide path or trench between them.

Sometimes the seeds are sown where the plants are to remain, which method saves time, but generally results in variation in the strength of the plants and the size or quality of the asparagus produced. Some growers prefer to sow the seed very thinly in a bed in April, planting out in the following April the best plants secured from these sowings. Subsequently the after-cultivation consists of manuring, earthing-up, cutting, and re-earthing during the season of cutting, keeping the beds free from weeds and insect pests, cutting the sticks level in November, and levelling down the ridges. The season of plenty is usually reached about the early part of June, and at that time the grass is allowed to run a little, and become green, when it is then bunched.

Permanent Beds.

Autumn work among the asparagus beds consists of cutting down all the growth and clearing it away; this work should be performed as soon as the growths have changed colour. The thorough weeding and cleansing of the beds must then be commenced, and as soon as this has been completed, the roots should be protected from winter frosts by a well-laid covering of short strawy litter. To keep this protective covering in place it is a good plan to pack up the edges of the bed to the level of the top of the litter.

Forming New Beds.

Efforts are sometimes made to rejuvenate old beds by scattering berries over them at the time of cutting or clearing off the heads of the plants in November. It is much preferable, however, to form a new bed where the old one has become exhausted or played out, as the former method only results in the growth of a lot of "sprue," which cannot be compared to the marketable "grass." For the purpose of forming a new bed a suitable piece of ground should be selected, thoroughly and deeply trenched, and supplied with a liberal dressing of partly decayed stable manure. Bonemeal is a very useful fertiliser when making up a bed. Asparagus beds that are properly prepared and well manured at the outset give a prolific crop for at least twelve years; while beds formed on the old system of cultivation have lasted well for twenty years or more. The permanency of this crop can therefore be well secured where suitable soil conditions exist, for often the exhaustion of the crop, after a limited period of time is not due to any failing on the part of the plants themselves, but rather to a rotting away or decay at the roots, due to excessive moisture or unsuitable soil conditions.

It is well to commence the preparation of a new bed as early as possible, so that the soil may have settled down comfortably for planting in April, or seed sowing in March. At all events, at least a month should elapse before finishing the bed and planting it. Plants may, of course, be purchased if the gardener is anxious to make a start immediately, while in the following March seeds may be sown to secure sets for a future year. He will in this way be forwarder with his purchased plants, while the sets secured from his own raising will be ready in the following spring for a future extension of the plantation. A very productive and fine flavoured variety of asparagus is Sutton's Perfection, which is an improved type of Reading Giant. Giant French is a large-sized variety, as also are Argenteuil Early Purple, Connover's Colossal, and Palmetto. For general purposes the first three mentioned varieties are to be recommended.

Sowing and Transplanting.

Seeds sown in good ground between the middle of February and the first week in April generally form the most robust and best cropping plants, provided they are allowed to grow and establish themselves permanently. Too thick or too thin sowings must be avoided: the former entails a great deal of work in thinning (which, by the way, must be done early and boldly, so that the seedlings are from fifteen to eighteen inches apart in the rows), and the latter may produce too small a crop after due thinning, thus necessitating transplanting, which is undesirable. When the practice of sowing in their permanent position is adopted, the seeds should be inserted, fairly thinly, in shallow drills, and covered with about half an inch of fine soil. The seed may also be drilled or dibbled in on raised beds three feet wide, with a space of about two feet between each bed. For transplanting purposes the usual practice is to select yearling plants, placing them on ridges, with the thin roots spread down the sides, and to the lower level at the bottom of the ridges. Freshly dug plants are most desirable where the crowns are purchased for this purpose, as if allowed to get dry they lose much of their initial vigour, and the mounded parts become very subject to decay when replanted.

After Culture.

This consists of thinning out the seedlings, weeding, and protecting the beds from injury by bad weather. Blanching is effected by earthing up to a slight extent with leaf-mould, and much good can be done by giving occasional dressings of salt, soot, and guano during hot weather. When the growths commence to assume an autumnal tint, the plants should be cut down and the beds tidied up for the winter. Not until the third year of growth can asparagus be cut. The best plan is to snap the sticks squarely and as deeply as possible, the tops then showing about two inches above the surface soil, and the scales on the head unopened. Good quality "grass," fit for the best tables, should be about seven inches long, of handsome appearance, with four or five inches of white stem, and the remainder of a nice purple colour.

Forcing.

Asparagus may be forced either in frames over hotbeds of manure, or in heated glasshouses. The roots for forcing should be quite three, or preferably four, years old, and may be dug up late in autumn and stored in a cool cellar or shed under straw. In hot houses a bed should be prepared with a covering of manure and leaf-mould, the clumps of grass packed closely together, and a temperature of from 55 to 65 degrees maintained. Excessive heat gives an earlier result, but the produce is slender, and very spindly as a rule. When a hotbed and frame is employed the roots should be laid closely together on the manure, and covered with a little soil. Edible shoots will be ready in about two or three weeks, and a supply will be available for five or eight weeks onwards. Fresh beds may be prepared at intervals of about three weeks from November to April in order to secure a constant supply

J. C. NEWSHAM.

A GREAT SEED HOUSE.

Messrs. James Carter and Co., who still retain their seed shop in High Holborn, and another in Queen Victoria Street, E.C., have moved their immense business centre from High Holborn to Raynes Park, a western suburb of Wimbledon, in the beautiful county of Surrey, and by so doing they have given splendid evidence of the great and ever-increasing importance of horticulture in this country.

Probably nothing in recent times has so distinctly shown the wonderful advances horticulture is making, as this change of address from High Holborn to Raynes Park. Change of address may mean many things. In this case it means new and enlarged premises to meet the growing needs of a great business; it means more room to develop the business and ability to cope more quickly with the increasing demand; it means up-to-date buildings, and altogether better conditions of light and air for the employees, and the last word in machinery for cleaning and preparing seeds; it also means ample space for the conduct of seed trials and tests under the eyes of the members of the firm, and a more direct control of every department of the firm's work than was possible in the City warehouses; it also means a magnificent advertisement for the firm, and a splendid object-lesson of what British pluck, enterprise, and honesty can accomplish.

It was in 1836 that the founder of Messrs. Jas. Carter and Co. commenced business at 237, High Holborn, and made a special feature of supplying seeds true to name, and of tested germinating quality. Since that time the premises have had to be enlarged many times, and about eighteen years ago the firm took over 97, High Holborn, opposite their original home, but, notwithstanding their grounds in Essex, and their nursery at Forest Hill, it became very evident some two or three years ago that an altogether larger place was needed to cope with the seed and bulb trade, a trade that ranges throughout the United Kingdom, and extends to our Indian Empire, the United States, and all the British Colonies. The need was urgent, and a site occupying about 22 acres was selected at Raynes Park, where there are ample frontages to the London and South-Western Railway Company's main and branch lines, along which pass about 800 trains per diem—a fine advertisement. A large business encourages big ideas, and it is not beyond the mark to say that Messrs. Jas. Carter and Co.'s magnificent warehouses and offices at Raynes Park are the finest of their kind in Europe, splendidly built, wonderfully convenient, finely appointed, and lighted, warmed, and ventilated in a manner beyond all praise.

GARDENING APPOINTMENT.

Mr. J. Wright, for two years foreman at Bear Wood, Wokingham, has been appointed head gardener to G. H. Williams, Esq., St. Donat's Castle, Llantwit Major, Glamorgan, and enters upon his duties on January 14.

THE GARDEN WOMAN.

It has often been remarked that reminiscences are of little value and interest, and that in these go-ahead times there is plenty of food for thought in watching everyday life and trying to keep pace with events as they are, instead of pondering over things that have been. This may be so, but we cannot help being reminiscent sometimes: indeed, life would be shorn of one of its pleasures if we did not now and then tell an old tale. I well remember an old friend, who used to remark about any good tale that was told in passing, "Ah! that will just do for you to tell when you get an old fellow."

The subject of these few notes was suggested by an article I read in a daily newspaper a short time ago, entitled "The Lady Gardener." The antithesis to the lady gardener is the "garden woman." This person is, or rather was, usually a garden labourer's or farm labourer's wife, who had usually brought up a family of children and sent them from home to get their living in various ways, and had time to spare to earn a little money to help keep the household together, and was also a person of great respectability and integrity, and withal clean and industrious. She was rather removed from her compeers, women in like circumstances being glad to work in the fields, stone picking, turnip hoeing, haymaking, harvest work, potato digging, or any field work which presented itself. Now, the garden woman's work was regular, and these other operations on the farms were intermittent, there being periods when their services were not required. The garden woman's work consisted of attending to the young gardeners in the bothy, cooking for them, making their beds, fetching the clean linen, etc., on alternate Saturdays from the mansion, cleaning the bothy, giving a little attention to the labourers, as far as tea making, etc., in their mess room, also doing rough work at the head gardener's house, and making up all spare time weeding, repairing blinds, cutting shreds for nailing wall trees, etc.

The hours were from eight o'clock in the morning till five o'clock at night, and the wages four shillings per week.

These are, as I have said, reminiscences, for to-day in this country it is very difficult to find a woman to perform some, or any of these duties at a very much enhanced rate of wages; indeed, a friend of mine had to pay ten shillings per week, and the hours of work were very much shorter, and when one woman retired from the work he had very great difficulty in filling the vacancy. Now one very great point with the garden woman was that she was not supposed to know anything about gardening: possibly she might have a very large garden cultivated in the best style at her cottage home, but when she went to the garden at the manse, domesticity had to be her forte. Womanly knowledge of horticulture was not required; indeed, it would have been thought presumption on her part to have suggested anything not exactly in her line of business. Her position in the garden social scale was lower than the garden boys, inasmuch as her name was at the bottom of the weekly pay sheet. Of course, I do not wish to say this is as it should be, and I should be sorry to write anything to detract in any way from the right of women to be gardeners, as now, in many cases, for instance in the textile trades, women compete on equal terms with men in some departments of manufacturing woollen and cotton goods.

The real difference between a garden woman and a lady gardener seems to be a matter of wages, combined with the facilities the lady gardener has of being trained at various colleges for indoor work, but for outdoor gardening the old-fashioned garden woman will take a lot of beating, if she was only allowed to exercise her knowledge of gardening to the full instead of being confined to the somewhat narrow channel I have described. W. M.

LATE-STRUCK JAPANESE CHRYSANTHEMUMS FOR EXHIBITION.

The following is the text of the paper read by Mr. Thos. Stevenson at the recent N.C.S. Conference:—

As the title of my paper suggests, I only propose to give here a very brief outline of the cultivation of Japanese chrysanthemums for exhibition from late-struck cuttings. Not that this is a new method, but I think it may somewhat explode the generally-accepted theory that chrysanthemums require a very long season of growth, and that the growth requires hardening to the consistency of a walking stick before it can be induced to give a thoroughly well-developed flower that is fit to take its place on an exhibition board.

That some varieties do give the best results when grown very hard I am quite prepared to admit, and the best example of a variety of this kind that I can think of at the moment is Duchess of Sutherland, and, speaking generally, all the very tall, and consequently faster-growing varieties, are best struck fairly early; but a very great many of our best Japanese chrysanthemums will give flowers equally as good, or even better, when struck later than if rooted in late November or early December. During the few years that I have been exhibiting I can assert that I have cut a greater percentage of first-rate exhibition flowers from plants rooted in March and April than I have from those rooted early and grown on in large 16's or No. 12 pots; but, as with every other system, there are certain points in connection with their cultivation that must be rigidly observed, or the flowers may not quite come up to one's standard of excellence.

ADVANTAGES OF LATE-ROOTED PLANTS.

Almost every season we hear rumours of the waning popularity of the large exhibition blooms, and many employers are undoubtedly averse to their being cultivated, but very often this is because they are grown to such a height that it is necessary to mount a pair of steps to see the full beauty of the flowers, but could they be grown dwarfer and arranged nicely where the full beauty of the flowers could be seen and admired, I feel convinced a great many grumbles would cease. Further, the plants would serve a double purpose, as most gardeners have to keep a conservatory or winter garden furnished; and what look nicer or are more easy of arrangement with other plants than good chrysanthemums, grown on single stems and in small pots.

I find that to obtain really good blooms the plants must be kept growing freely from the time of rooting, never allowing them to receive a check or become pot-bound in the intermediate stages of growth, and always aiming to get them in their flowering pots as early as possible, of course taking into consideration the date of striking. This is one of the main points to be observed, and another is the watering. From the outset the plants will take more water in proportion than will the earlier-rooted ones, without it in any way tending to make them sappy or gouty, due no doubt to the drier and warmer atmosphere at the time of striking. I also find that taking the buds may be done from seven to ten days later than the older plants, as they develop their blooms rather more quickly, and it is astonishing with what accuracy one can time the buds of these single-stemmed plants.

Some of the varieties may be grown straight away, the natural break occurring at just the right time for one to take the resulting first crown bud, while others will require stopping (in most instances some time during June) to ensure the buds being secured about the right time. If the plants are growing freely, which they should be during June or early in July, the stopping will not be much check to them, as they break into fresh growth within a very few days. I have practised stopping the plants twice, once immediately after they are established in 60-sized pots, and again as may be necessary for the timing of the buds; this double stopping keeps the plants very dwarf, but it certainly is at the expense of the flower. The first stopping tends to check root action, and the plants never recover the lost ground, and this is why I am so much opposed to the much-advised March stopping of plants (in this instance, early struck) to secure second crown buds.

In the past season I purposely stopped some of the strongest plants of several varieties in March for the sake of comparison, and though the weaker plants of the same varieties were stopped in June for the purpose of timing the buds, they simply grew right away from the early-stopped ones in every instance, and produced very much finer flowers.

Another point: These late-struck plants, if kept in fairly small pots, say, large 32's and 24's, will take a great deal more manure than the others right up to the time the florets begin to hang down, without showing any signs of damping in the florets, and this late feeding ensures the flowers opening quickly and finishing well, without any indication of staleness, so that these late-struck plants have several points to recommend them. First, their short season of growth, as compared with those struck in December, and the small amount of frame room required till the middle or end of April. Secondly, the greater accuracy of timing the buds and the subsequent easy opening of the same; and thirdly, by their dwarfness, which enables them to be housed in smaller structures, where they can be easily seen and handled, and also by their greater adaptability for grouping and other decorative purposes, so that this system of cultivation should especially commend itself to amateurs.

PROPAGATION.

From the last week in March to the end of April is the best time for propagating, and stock plants should be specially looked after for the purpose. Very early in the season all cuttings should be removed to the surface of the soil, and after growth begins to break up again they may be at once removed to the cold frame, and should be given all the light and air possible to keep the cuttings quite sturdy. Strong, sappy cuttings always take longest to root, and never make as many roots as do the finer and harder ones. The stock plants must be kept free from fly by syringing with soft soap or some other approved insecticide, but must not be fumigated or all the edges of the leaves will turn yellow or brown, and thus early spoil the appearance of the plants. Also, if the plants the year previous have been infected with the rust fungus, they should be syringed, or the cuttings dipped in a solution of sulphide of potassium, ½oz. to one gallon of water, previous to being inserted in the pots or boxes.

At this season of the year, if the cuttings are fairly hard, they will root well in almost any kind of glass structure, but as the aim should be to root them quickly with as little flagging as possible, it is advisable to place the boxes or pots, whichever you are using (I prefer boxes), in a house or frame, where a fairly humid atmosphere is maintained, [illegible] in such a position that they have a little shade during the hottest part of the day, and [illegible] where they will not commence running [illegible] before making roots. As soon as rooting commences, gradually inure the plants [illegible] little air, and lose no time in potting [illegible] into middle 60's, and replace them in a frame where they may be kept moderately close [illegible] a few days. Should the weather be warm [illegible] should not hesitate to give air at night [illegible] immediately after potting, but would [illegible] them fairly close during the drying part the day. Keep lightly sprayed, and in a very few days hardening in earnest may be commenced, so that in a fortnight or so after potting the lights may be entirely removed on all favourable occasions. Use the syringe to prevent them flagging during the hottest part of the day. From now onwards the treatment will be very similar to that accorded the earlier rooted plants, except that the former are in 60's, whilst the latter are in 32's. Keep a sharp eye on the watering, as these small pots soon dry under the influence of wind and sun. As soon as the roots have reached the sides of the 60's, a shift will be necessary, this time into 54 or 48 sized pots, according to the size of pot one is using for flowering them in. Use a fairly rich open compost at this potting, making the soil as firm as you can without using a rammer, and should the weather be favourable they may not require the shelter of a frame, but be placed straight out of doors; preferably pot thick for a few days, spacing them out as soon as the roots begin to run into the new soil. Keep the plants well syringed twice daily, using well diluted soot water, and look well after the watering, though at no time must water be given to excess. As soon as ready they may be given their last shift, this time into large 32's, or some of the stronger growers into 24 sized pots.

DATES OF ROOTING CUTTINGS, ETC.

It may be of interest to give the dates of inserting the cuttings, and of the several pottings. On looking up my diary I find the cuttings this year were inserted on March 26, potted into 60's on April 20, on May 9 into 54's, and into their flowering pots on June 4. In 1909 the dates were March 29, April 19, May 12, and June 5. From this it will be gathered that dates vary very little from year to year, and certainly not more than a few days at the most. It also shows that the plants are shifted along quickly in the young state, and this quick shifting tends to keep them stocky and prevents the wood getting hard, which it is very apt to do once they are allowed to become pot-bound. To ensure good flowers I like to see the wood swelling up gradually as the plants grow, and not thin at the base, with stronger wood further up; in plants of the latter type the flow of sap cannot possibly be so free as when the stem is of good even thickness all the way up.

Of course, the cuttings may be inserted later than the date stated, and for grouping may be put in as late as the first week in May, the plants will give good flowers, but it is hardly possible to secure really heavy blooms suitable for showing. Further, these plants have to be shifted into their flowering pots much later than I have mentioned, but from my own experience late potting is not to be recommended, as where a variety is at all likely to damp this will accentuate the evil in a remarkable degree. As an instance of this, I had several plants of a new variety struck very late this season, and as they made such good plants, I gave them an extra potting, but the results were terribly disappointing—not one flower opened without damping seriously; and, though I rather anticipated this from past experience, and consequently gave them the best position to try and avoid the damping, yet I could do nothing with them, hence my advice to pot as early as possible.

COMPOST AND REPOTTING.

It is not necessary for me to go into details of compost, it being sufficient to say that this should be moderately rich, not too heavy, but sufficiently porous to allow of the free passage of water at all times, even in the event of very wet stormy weather: and you may be sure there is something radically wrong with the compost if water is found to stand for any length of time in the pots, either after watering or after a storm, and I would strongly advise growers to err on the light rather than on the heavy side with their compost. This may mean a little more labour in watering, but this is quite counterbalanced by the plants keeping up a steady growth during a very wet time, should such be experienced during July or August. A point I should have mentioned is to crock the pots well, as this will save much anxiety towards the end of the season.

Pot firmly, using a rammer, but do not make the soil so hard that the roots cannot ramify through and through it, and leave sufficient room for a small top-dressing or two of soil as the season advances. After potting, I again prefer to stand the plants closely together for the convenience of spraying, and this also keeps them from drying quite so much, which is a distinct advantage with freshly-potted plants.

So far I have dealt with the cultivation up to the time of shifting into their flowering pots. As soon as the roots begin to take to the new soil the plants should be stood out in their permanent quarters for the summer, and this, for preference, should be on an open piece of ground, with a good ash base, and as free from trees as possible, with, perhaps, a little shelter from north and east winds, but this is not imperative, as after this date we have very little wind from such directions. The plants should be placed about 18 inches apart in the rows, and the rows a yard apart, which will give them ample light and air. To prevent damage by wind the tops of the stakes should be tied to a wire running from end to end of the rows, a bit of advice which may be considered unnecessary.

After this the work is very straightforward; tying must be regularly attended to, as also must be the removal of all side shoots; watering is an important matter, and the soil must not on any account be allowed to dry. Syringing is also very necessary, and on all fine days should be done both morning and afternoon, though not after from 3.30 to 4 p.m., or, if the situation is somewhat low-lying, it might be conducive to mildew. During dull weather syringing should be discontinued, and towards the end of the season it should be gradually lessened, the days, as well as the nights, being so much more moist.

FEEDING.

This is also an item in the cultivation which must be carefully looked after, and I have seen it recommended that feeding should commence as soon as the buds are taken. Personally, I prefer to commence feeding much earlier than this, in fact, as soon as the plants are in good growth and the pots fairly full of roots I like to give them a little liquid manure. Remember, I put but very little manure in the potting soil, and certainly nothing the plants are likely to take up for some time, bonemeal being the chief addition to the soil. As soon as the plants require it, and before they show any signs of suffering, I give them a little artificial manure, and continue this every week or ten days until the flowers are expanding nicely. Two or three times during the growing season I give a slight top-dressing of soil, which is watered in with a rose, and not pressed down, and I find this watering with a rose keeps the surface soil firm right through the season, and is much to be preferred to watering with the spout of the can, which is bound, at times, to expose some of the surface roots if used at all carelessly

TREATMENT UNDER GLASS.

The treatment the plants are accorded after housing is made the same as advised by the other growers. I think it very much benefits the plants, and certainly lessens the tendency to damp, if they are housed before the florets actually show colour, as we usually find the few early blooms we are in the habit of leaving out of doors as long as we can are the most subject to damping, and I would strongly advise early housing, as I am sure the flowers will not be any earlier in opening. Give all the air possible during fine weather, but as soon as the flowers begin to open a little fire heat must be given to keep the air inside the house dry and circulating. During very wet or foggy weather it is wise to stretch tiffany over the ventilators to prevent the moisture driving in, but never under any circumstances take off all the top air. As the flowers develop cold draughts must be avoided, as I have often found that all one side of a bloom will damp where it has been exposed to the cold draught of a front ventilator. Discretion is very necessary in this matter of airing and heating, and though no hard and fast rule can be laid down as to the temperature that the chrysanthemum house should be kept at, yet it should at all times feel dry and comfortable on entering, and even on cold nights ought not to drop below from 48 to 50 degrees.

STOPPING.

As pointed out earlier in the paper, the buds on these plants may be timed fairly accurately, and most of the varieties will need to be stopped to get them out for a given date. There are just a few, such as Edith Jameson and its sports, that require pinching in April, i.e., as soon as they are established in 60's. I have grown these varieties right away without stopping when propagated in March, but they are usually a few days early, so it is best to stop them. There are also a few varieties, such as Madame Paolo Radaelli, Hon. Mrs. Lopes, Mrs. D. Thornton, and Captain Mitford, that require stopping during the early part of May to get really good exhibition blooms; after this there are very few but what may be left until after they are in their flowering pots before being stopped.

Bessie Godfrey, Frank Payne, Chrysanthemiste Montigny, Madame G. Rivol, Mrs. W. Iggulden, W. Gee, Mrs. C. Penford, Duchess of Sutherland, and Master David are among the varieties that should be stopped during the first ten days of June, whilst most of the other popular varieties, such as F. S. Vallis, Reginald Vallis, James Lock, Sir Frank and Lady Crisp, Mrs. G. Mileham, Lady Talbot, Valerie Greenham, Master James, Superbe, Walter Jinks, Miss A. Nichols, Algernon Davis, Rose Pockett, Purity, W. Mease, Sir A. Rollit, Harry Wood, Bessie G. Payne, Francis Jolliffe, etc., give the best flowers when stopped between the 10th and 20th of the month. There

Eckford's Giant SWEET PEAS

The Finest Blooms

that blossom on the Sweet Pea Plant are grown from Eckford's famous seeds. Eckford, the Sweet Pea Specialist, supplies only seeds that are bound to give good results. Eckford's seeds flower brilliantly, give brighter colours, longer stems, larger flowers, and succeed even in the most difficult soils.

Villa (B) Collection.
24 splendid varieties, suitable for exhibition, 50 seeds of each, 5/6

Villa (C) Collection.
12 splendid varieties, suitable for exhibition, 50 seeds of each, 2/9

HENRY ECKFORD, F.R.H.S.,
(Dept. 221),
WEM, SHROPSHIRE.

Eckford's Giant SWEET PEAS

are a few that may be stopped even later than this, such as White Queen, J. H. Silsbury, Mrs. W. Knox, O. H. Broomhead, Miss H. Rowley, Maud Jefferies, Mrs. L. Thorne, and Splendour, etc., etc. Though I recommend these dates for stopping, should the natural breaks occur at any time within a few days of the dates mentioned, I should let this suffice, as the less check given to the plants the better they will do. Of course, if anyone thinks of following these dates, due regard must be given to the locality, but for anyone south of London they should at least prove a very serviceable guide, always bearing in mind that the plants should be very liberally treated from the time they are well rooted in their flowering pots.

There are, I know, many minor points not touched upon, but I have confined myself as much as possible to what is really essential in the production of good exhibition blooms from late-struck plants, and I can only hope that the advice may prove interesting and useful.

MARKETS.

EXHIBITIONS AND MEETINGS.

◆

Beckenham Horticultural Society.

On Friday, the 6th inst., Mr. J. A. Watson, B.Sc., of Elmside, Redhill, Surrey, gave a lecture before the above society on "The Life Stories of a few of our Common Weeds" (illustrated with lantern slides). There was a fair attendance considering the unpropitious weather. The plantain, dandelion, groundsel, thistle, etc., were discussed. An invitation was given to some boys of the council's schools to attend the lecture, the object in view being to present a certificate to the boy who should write the best account of the lecture. Several lads attended. Mr. Watson dealt with the subject from a botanical standpoint, but pointed out the time of flowering, the adaptation to secure cross-fertilisation, whether annual or perennial, etc. Hearty thanks were accorded Mr. Watson.

Mr. F. W. Price secured a special award for an oncidium, with finely-developed spikes of flower. Mr. Libbiter showed a dish of seedling tomatoes.

Bournemouth Gardeners' Association.

The first lecture of the New Year was given by Mr. C. Pearce, of Astney Firs Gardens, on January 3. The subject of the lecture being "The Cineraria."

At the fortnightly meetings exhibitions of fruits, flowers, or vegetables have been held, and prizes awarded during the last session, and in the future it is proposed to hold exhibitions at all meetings, and to award good prizes. Honorary exhibits will be a feature in the future as in past years, and points will be awarded according to the merit of each exhibit. At the meeting just held prizes were awarded for three gentlemen's buttonholes (any flowers), to be shown on a board.. Some extremely beautiful exhibits were staged, the judge being Mr. R. Chamberlain, florist, Bournemouth. The first prize was awarded to Mr. C. King, whose exhibits were made up of bouvardias, tuberoses, and carnations, with suitable greenery. Mr. Heath was second prizewinner, Mr. Nippard third, and Mr. Dowell fourth.

Mr. Pearce showed three very fine plants of cinerarias, for which he was awarded a first-class certificate. The lecturer first dealt with sowing the seeds, advocating very thin sowing, and also under cool conditions, as in a cold frame, where late sowing was the rule. But if early-flowering plants were required then he advised cultivators to sow the seeds in a gentle heat. The earliest sowings, the lecturer said, should be made in April; but for general purposes, sowings in June were early enough. He referred to the hundreds of strong seedlings that had come up in the open borders in his own garden from self-sown seeds, the latter shed by old plants placed outside. Mr. Pearce strongly advocated growing cinerarias under cool conditions throughout the summer months, and in positions where there would not be any occasion to apply shadings against strong sunshine. Overcrowding should be avoided, as plants so grown possessed long-stemmed leaves, and were, generally, much drawn up. He said the plants must have abundance of air, and also plenty of moisture around them. He did not favour the use of thumb pots for seedlings, but preferred to transplant the latter around the edges of shallow pans, and afterwards to place them in large pots. Two parts fibrous loam and an equal quantity of sweet leaf-soil, with a sprinkling of old mortar rubble, formed the compost for the final potting, and he, the lecturer, always used a small quantity of rotted manure

Having referred to the causes of the white leaf maggot, and other insect pests, the lecturer answered a number of questions from the members present. The discussion was a lengthy and interesting one, the feeding, pinching, and other matters of cultural interest, being dealt with. Hearty votes of thanks to the lecturer and Mr. Reeves, the chairman, brought to a close a very profitable evening.

Bristol Gardeners' Association.

A meeting was held on December 29, at St. John's Parish Rooms, when Dr. Shaw occupied the chair. A lecture on "Protective Colouring of Insects" was given by Mr. Stafford, the master of Caerleon Schools, Newport. The lecturer gave a brief life-history of the Lepidoptera family by way of introduction, with black-board demonstration, stating that he had made this a special study for twenty years, and during this period had collected most of the British moths and butterflies, and a large number of foreign specimens, several cases of which were set out along each side of the room. Particularly noticeable were the gorgeous colours of the specimens from India and Brazil. Mr. Stafford said insects owe their colour to pigments embedded under the skin; different food caused different colours; and colour was both for aggressive and defensive purposes. Most wonderful was the protective mimicry of some insects, while others emitted a nasty fluid as protection from their enemies. The Indian leaf butterfly (specimen on view) has veins and ribs similar to that of a leaf. The Atlas moth, he said, was the largest in the world, some examples measuring eleven inches across. A good discussion followed.

For two zonal pelargoniums, Mr. Bastin was awarded first prize; seven points going to Mr. Springham for parsnips and Apple Scarlet Pearmain; three to Mr. Scott for Newton Wonder apple; and five to Mr. Woodward for Cypripedium Countess of Carnarvon and C. Œdippe.

Easton Neston, Towcester.

"Your **Caustic Alkali Wash** I can highly recommend as a good all-round wash for fruit trees in general. I have used it extensively here both on young and old trees, on walls, espalier and others, with excellent results. Old trees that were literally smothered with mosses and lichens being left after the dressing with the heart quite clean of anything. It might also interest you to know that I find the best means to apply the wash is by the aid of the **National Knapsack Sprayer** you supplied me with in the spring of last year, a most excellent article, enabling the operator to more thoroughly distribute the wash, with the minimum of waste."

(Signed) G. HALLETT.

Prices: 40 tins, **37/6**; 20 tins, **20/-**; 10 tins, **11/-**; 5 tins, **7/-**; single tins, **1/6**. Carriage Paid. One tin makes 10 gallons of wash.

The FINEST GRAPES in ENGLAND

those winning the First Prize in the Premier Grape Class at SHREWSBURY,

were fed entirely with "LE FRUITIER."

See letter below.

£100

IN PRIZES AT SHOWS.

ORFORD HOUSE GARDENS,
NR. MARKET RASEN, LINCS.

Gentlemen,

As I have this season used only your "Le Fruitier" on all my Vines and Fruit Trees, I thought you would be interested in my success. I have taken over £100 in prizes at five shows, in addition to carrying off the first prize in the Premier Grape Class for 12 bunches of grapes at Shrewsbury Show. I won 5 other first awards.

The above results confirm my opinion that your "Le Fruitier" is the best Manure I know of to grow and finish grapes and other fruits for exhibition. Yours truly,

W. PARKER.

BONES Specially Prepared, 1in. to ½-in. and Meal. Quotations to your Station.

CHARCOAL Pure Vegetable, 3/- per Bushel.

LOAM Prime Yellow, Full of Fibre.

PEAT-ORCHID All Pure Fibre, no Waste. Prepared ready for use. 12/6 per large cask.

PEAT Selected Turves in Prime condition for Stoves and Greenhouse Plants.

RHODO. PEAT 15/- per Ton, Free on Rail, Hants.

BINDING CASES for binding the 12 months' numbers, green cloth, ornamented in gold, price 2s., post free.

VOLUME LIII., bound in green cloth, containing the 52 weekly numbers, 1910. Price 12s. 6d.; by post, 13s. 1d.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

GRAFTING.—A. F., Weston-super-Mare: Yes, certainly.

CUCUMBER BELLE VUE.—A correspondent wishes to know the raiser and distributor of Cucumber Belle Vue.

BRITISH GARDENERS' ASSOCIATION.—F. E. W., Wrexham: This association is steadily gaining strength, but we do not know the exact number of its members at the present time. The secretary of the B.G.A. is Mr. John Weathers, and his address is Talbot Villa, Isleworth, W.

WEEDS ON LAWNS.—R. W. B., Leamington: If the weeds are very numerous indeed the best plan will be to re-turf or sow the lawns, but if there is upwards of 50 per cent. of grass among the weeds, a good dressing of one of the lawn sand preparations, followed in due course by a rich surface dressing, and the application of good lawn grass seeds, will work wonders. You can obtain lawn sand for the destruction of weeds in lawns from any of the sundriesmen or seedsmen who advertise in our columns.

BEGONIA GLOIRE DE LORRAINE UNDER COOL TREATMENT.—The following interesting letter comes from a Nottingham correspondent, and, as to our knowledge, the famous Begonia Gloire de Lorraine is grown under, apparently, widely differing methods with fair success, we publish the letter in the hope that our readers will send us quite brief accounts of their methods, with special reference to temperature. "What do you consider the lowest possible temperature in which Begonia Gloire de Lorraine can be propagated and grown well? I have grown a few on several occasions, and my experience is that they appear to need a fairly high and moist temperature during the season of growth. I have visited gardens and seen them growing, and in most cases they have been cultivated in mixed stove collections or cucumber pits. In several large gardens I have seen a span-roof house devoted to the begonias, and in each case the house was kept very warm and humid. I have also seen attempts made to grow B. Gloire de Lorraine in cool, airy houses, with miserable results. One person told me recently that he had seen this begonia growing and flowering in a house heated only by two rows of four-inch pipes—a flow and return; I could quite believe they might be flowering in such a house then (October), but I could not believe they were wintered and propagated in a structure heated only for a cool greenhouse. Probably they may have been bought in the spring and kept until flowering time, but this is only surmise. The few plants I have grown have had a temperature seldom lower than 60 degrees, and yet they never become large, and always seem to grow slowly. Perhaps the soil makes some difference. Some time ago I visited a noted garden not far from here, and one of the young men told me B. Gloire de Lorraine could hardly be grown in a certain establishment where he had been employed, while in a neighbouring garden specimens 2ft. to 3ft. high were easily produced. I have a house that was originally a vinery, but has been reconstructed for a warm house. It has open lattice staging, painted a dirty green colour, which gets terribly hot on sunny days. In my opinion this is not a suitable staging for a house where moisture is needed. The dimensions of the lean-to are 15 feet long, 16 feet wide, 13 feet 6 inches high, and 5 feet to the sill. A gable runs two-thirds the sill and meets in the centre of the roof, giving more air space than a flat roof would. There are about 100ft. of 4-inch pipes, and I wonder whether this is sufficient to maintain a temperature high enough to enable me to grow Begonia Gloire de Lorraine well?"

ROSE MILKY WAY.—Mr. M. H. Walsh, Woods Hole, Mass., U.S.A., sends the following letter, which we gladly publish, as we were quite under the impression that this rose was raised at Waltham Cross: "My attention has been called to your issue of July 9, 1910, under heading of new single rose Milky Way, and in which it states Milky Way is a new seedling rose raised by Messrs. Wm. Paul and Son, Waltham Cross. This is misleading. The new single rose Milky Way is one of my productions, and not Messrs. W. Paul and Son's. Kindly make this correction, and oblige."

ROSE SOCIETY'S RULES.—J. B., Gourock: If you accept the society's rules you can scarcely alter them to suit your own convenience without first submitting the matter to the society. Your best course will be to write to Mr. Edward Mawley, V.M.H., Rosebank, Berkhamsted, stating your case, and the reasons for wishing to make the alteration. Mr. Mawley will then tell you how far the rules are binding on societies in affiliation with the N.R.S.

PRUNING ORCHARD TREES.—S. F. K., Malvern: The matter is dealt with as follows by the Board of Agriculture, and the leaflet to which you refer is No. 70: When young standard trees are properly pruned for the first five or six years after planting, they require very little attention in that respect later. They should be gone over each year, all surplus wood being thinned out, and interlacing or diseased branches cut away. Non-observance of this practice will result eventually in the development of a head of densely tangled and diseased branches, examples of which are to be found in nearly all old orchards. The extent to which this condition may be remedied by careful pruning depends very largely upon the individual trees. If, for example, a tree is very old, the amount of wood which ought to be cut out is generally so great that its removal seriously weakens the tree, and frequently even kills it. In dealing with old trees it is necessary that the greatest care be taken not to remove too much wood at one time. It is better to spread the operation over two or even three seasons than to cripple the trees by too severe pruning. Many full-grown trees do not lend themselves at all well to the purposes of pruning. The requisite thinning-out of the wood frequently cannot be accomplished except by the removal of many of the larger branches, with the result that a very large portion of the head, and especially of the fruiting wood, is lost. When pruning is being done, therefore, these facts should not be overlooked. As much surplus wood and interlacing and diseased branches as can be spared should be cut out, and particular attention should be given to thinning in such a manner that the fruiting wood is exposed as far as possible to a free supply of air and sunlight. Extra time spent in removing dead and diseased twigs will be profitably occupied, for it is on such parts that some of the most serious fungoid pests, such as the brown rot and apple scab fungi, pass the winter stages of their life-history, and in the following spring break out into active growth and produce another epidemic of infection. All prunings should be burnt immediately, in order to destroy insect and fungoid pests; the ashes should be distributed over the soil as manure.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss or soft leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

M. B. J., Merton.—1, Justicia calycotricha; 2, Begonia Haageana; 3, Lithospermum prostratum.

W. M., Hale.—1, Cypripedium Œdippe; 2, C. Leeanum; 3, C. Hera Euryades; 4, Cœlogyne cristata; 5, Selaginella uncinata.

L. N. S., Sandgate.—1, Fittonia Pearcei; 2, Curculigo recurvata; 3, Cyperus papyrus; 4, Nephrolepis Duffi; 5, Ardisia mamillata.

P. G., Hereford.—1, Cotoneaster frigida; 2, Quercus Ilex; 3 Ligustrum lucidum; 4, Cupressus Lawsoniana; 5, Abies Nordmanniana.

C. C., March.—1, a beautiful garden variety of Begonia Rex; 2, not recognised, please send when in flower; 3, Amaryllis aulica; 4, Gymnogramma Wettenhalliana; 5, G. Matthewsi.

FORTHCOMING ENGAGEMENTS.

MONDAY, January 16.—Royal Horticultural Society, Examination of Employees in Public Parks.

TUESDAY, January 17.—Royal Horticultural Society, Meeting of Floral, Fruit, and Orchid Committees, 12 noon: General Meeting, 3 p.m.: Lecture by Mr. H. C. Long on "Weeds and Weed Seedlings": Scientific Committee, 4 p.m.

Full Instructions on Planting and Propagation of Hardy Plants and Flowers.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

EASILY-GROWN HARDY PERENNIALS.

By G H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

SOME FEATURES OF THE WORK:

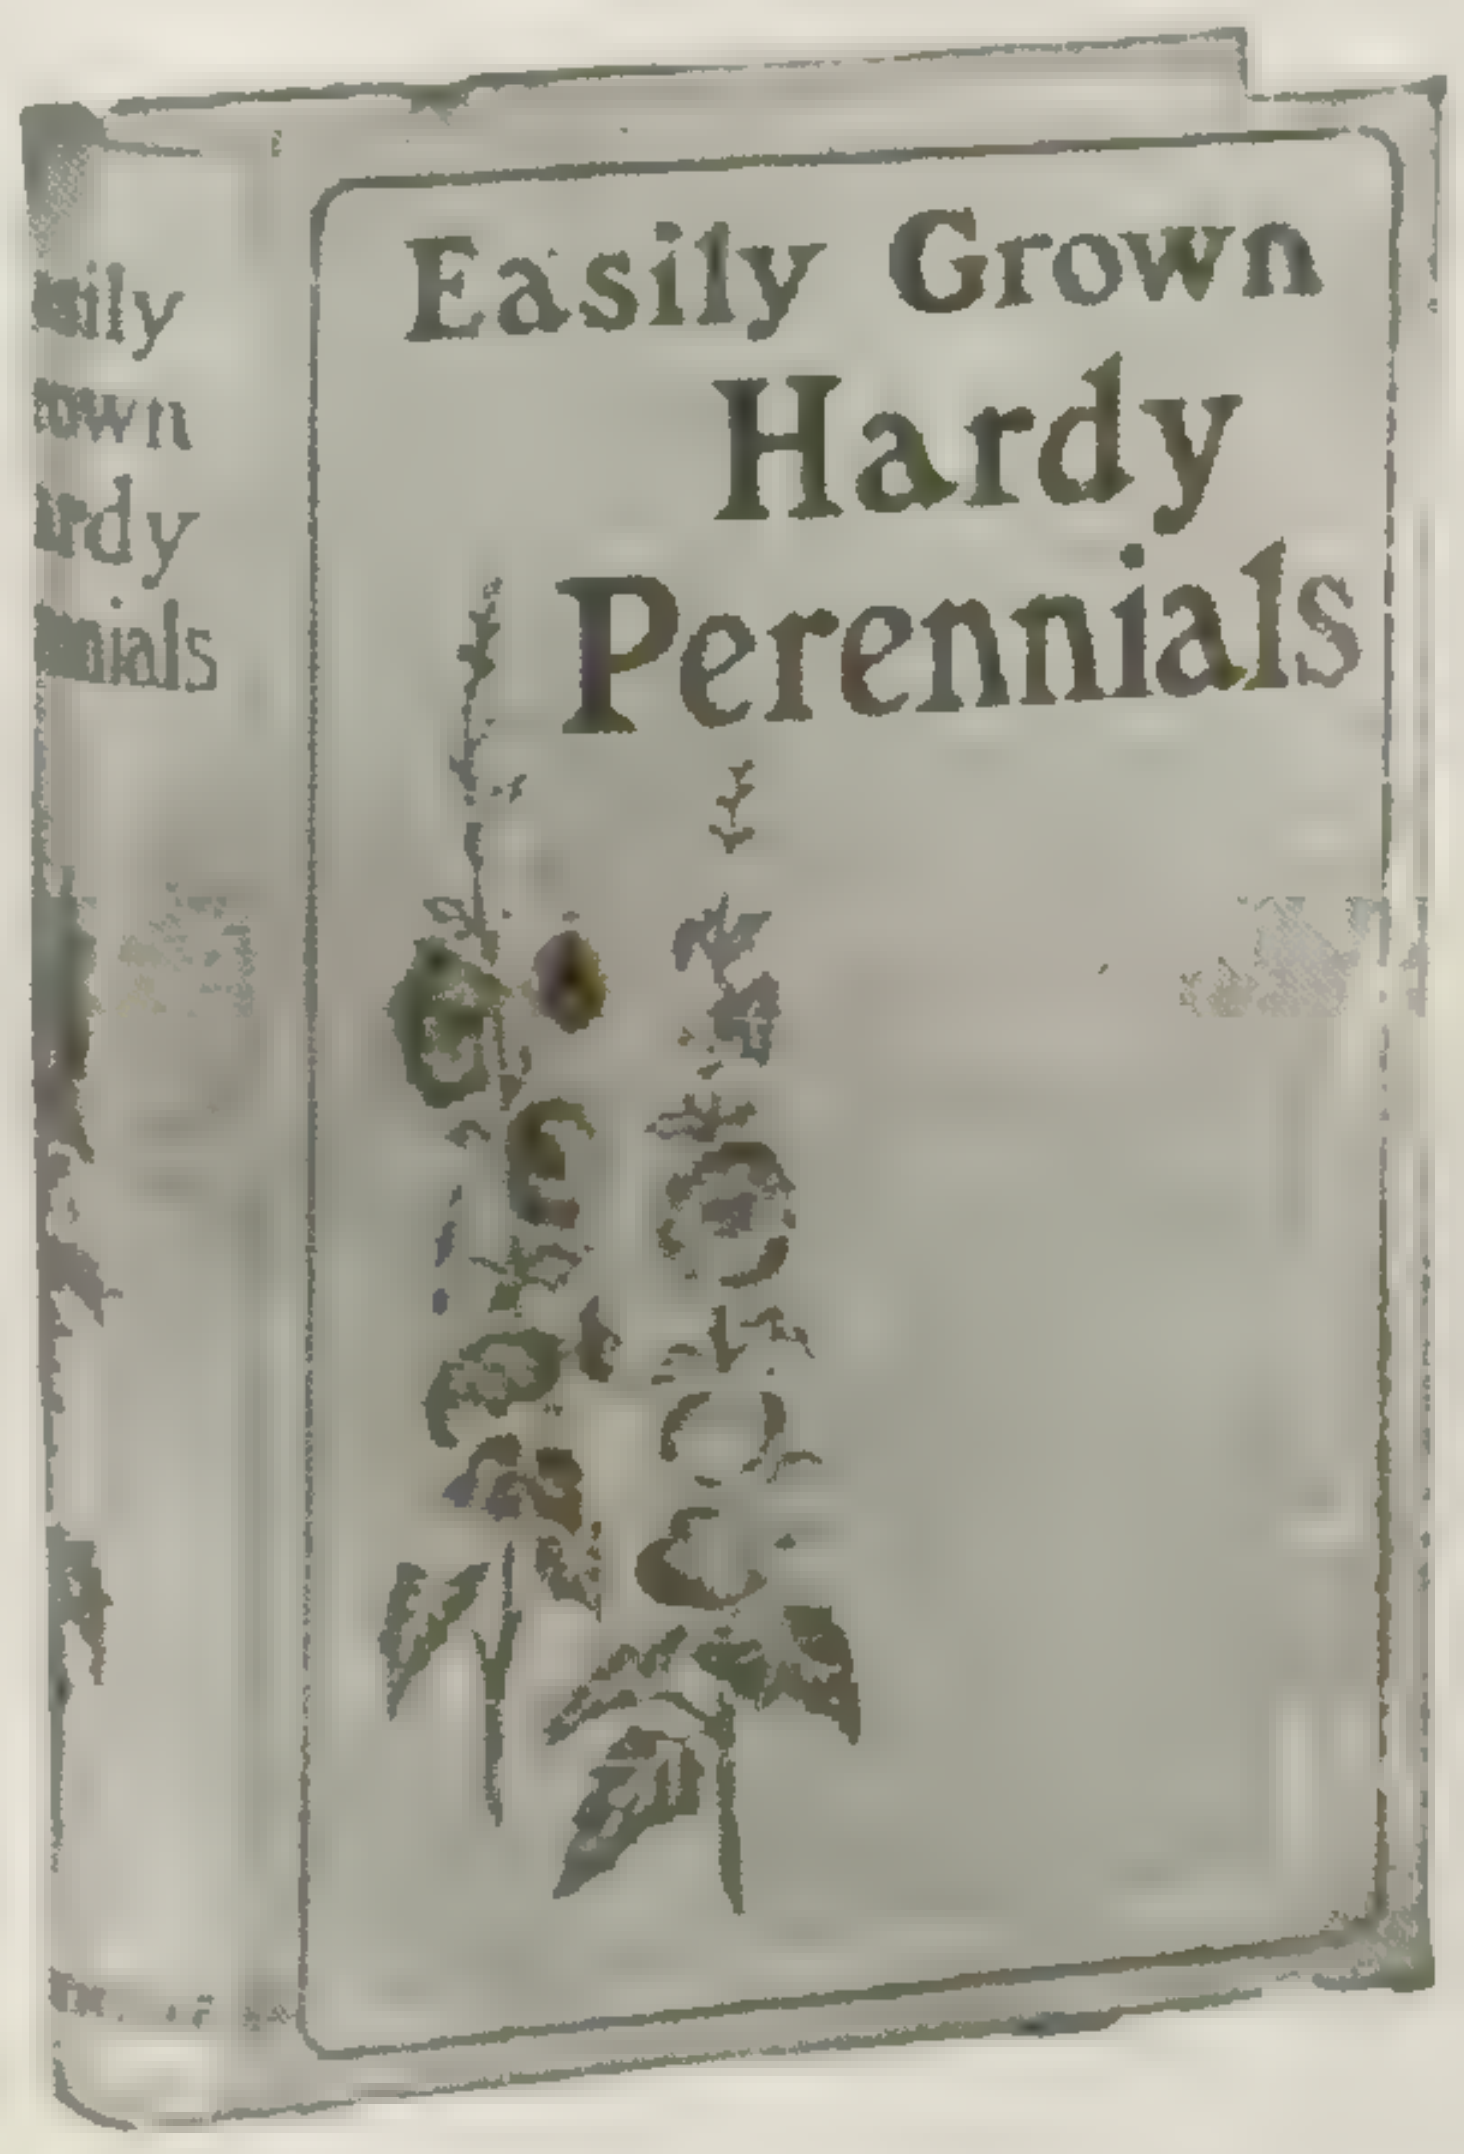
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.—Gives the botanical or generic name of each genus of plant described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

NEW GARDEN PEA FOR 1911.

MASSEY'S RELIANCE, per packet 1s. post free.

Mr. W. A. Cook, Head Gardener to Sir E. G. Loder, Bart., writes: "I am very pleased to inform you it proved a great success, especially as it was such a cold wet time for early peas. Sown on the same day as several other varieties, it was not one day behind, and is equal in bulk to anything I have ever grown. Haulm about three feet, with especially long pods for so early a Pea."

Countess Spencer, blush pink.
Henry Eckford, orange-scarlet.
Helen Pierce, white, veined blue.
Lady Grisel Hamilton, lavender.
Lady Althorp, blush, waved.
Miss Wilmott, salmon pink.
Nora Unwin, pure white.
Phenomenal, white, edged lavender.
Queen Alexandra, intense scarlet self.
Queen of Spain, pale reddish-lilac.
Sybil Eckford, cream, suffused pale pink.

COLLECTION No. 22, Price 1/9.
12 Very Fine Waved Varieties.
The number of seeds and price per packet is indicated after each variety.

Apple Blossom Spencer, rosy-mauve ([illegible]), [illegible]d.
Chrissie Unwin, carmine-lake (30), 3d.
Enchantress, rich rose (50), 3d
Frank Dolby, clear lavender (50), 3d.
James Grieve, creamy-yellow (50), 3d
John Ingman, rosy-pink, shaded carmine (50), 3d.
King Edward VII., rich carmine-scarlet (50), 2d.
Mrs. Bieberstedt, deep heliotrope (50), 3d.
Mrs. Routzahn, primrose, edged rose (30), 3d.
Paradise Ivory, cream, suffused rose (40), 3d.
Purity, pure white ([illegible]), [illegible]d.
St. George, cherry-red and rose-purple (50), 2d.

Collections 21 and 22 together for 2/3, with one packet of Paradise Blue Flake, 3d., gratis.

COLLECTION No. 23, Price, 2/9.
12 Extra Fine Waved Varieties.
The number of seeds and price per packet is indicated after each variety.

Clara Curtis, creamy-yellow (50), 3d.
Constance Oliver, rose, creamy ground (25), 6d.
Elsie Herbert, white, edged rose-pink (25), 3d.
Flora Norton Spencer, Ageratum-blue (40), 3d.
Florence Wright, pure white (25), 6d
Helen Lewis, madder-lake (50), 3d.
King Edward Spencer, crimson, waved (40), 4d.
Marjorie Willis, carmine and rose-red (25), 3d.
Mrs. Wilcox, white, striped crimson (20), 3d.
Olive Ruffell, cream, suffused rose (40), 3d.
Tennant Spencer, violet-mauve (50), 4d
Sweet Lavender, white, watered lavender (25), 6d

Collections 22 and 23, if purchased together, price 3/9, with one packet of Aurora Spencer, rose flaked white, 6d., and Winnie Savage, rosy-lilac, 6d., gratis.

COLLECTION No. 24, Price 4/-.
12 Newest Varieties.
The number of seeds and price per packet is indicated after each variety

Asta Ohn, light lilac and heliotrope (30), 4d.
Etta Dyke, pure white (30), 3d.
George Stark, finest scarlet (40), 6d.
Maud Holmes, waved crimson, sunproof (10), 6d.
Mrs. A. Ireland, mauve-rose, waved (30), 4d.
Mrs. Hardcastle Sykes, pale lilac-rose (40), 3d.
Martha Washington (syn. Eric Harvey), white, flushed rose-red (25), 1/-.
Mrs. Hugh Dickson, cream and pink, waved (12), 6d.
Mrs. Breadmore, cream, edged strawberry (30), 4d.
Othello Spencer, the best dark waved variety (20), 3d.
Winsome, rosy heliotrope (12), 6d.
Zarina, rich peach pink (30), 6d

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Floral Selection.

In these days of great floral exhibitions, where the eye is regaled with such a marvellous multiformity of flowers, diversified in make, arrangement, and colouration on apparently infinite lines, we are apt to impute all this to human selection directed to the improvement of normally simple forms. In many cases this idea is correct, as in the chrysanthemum, the begonia, the sweet pea, and even in the rose, but it must not be forgotten that there is a host of most beautiful flowers which have been evolved, and boast both size and colouration equal to the best of man's productions, and yet owe their charm and development entirely to insect selection exercised through the æons which have elapsed since flowers proper first made their appearance. To this class belong many of the choicest orchids, which, in some occult way, have developed their grand and ornate blossoms in tropical forests, where the foot of civilised man had never penetrated until their discovery. The same may be said of many of the finest lilies, so far as their, so to speak, spontaneous development is concerned, while such magnificent blossoms as are displayed by the tropical passion flowers, tacsonias, daturas, and innumerable others, are one and all Nature's unsophisticated productions, so far as man is concerned. What, too, must we say of by far the largest flower of all, the Rafflesia Arnoldi, by the side of which the huge Japanese chrysanthemums must hide their diminished heads, its individual flowers measuring a yard in diameter, mere parasite though it be. The curious feature of this wonderful plant is the fact that it attracts the fertilising insects by a humanly repulsive carrion-like odour, and repays them for their services by inducing them to lay their eggs in it under a misapprehension, the unfortunate carnivorous grubs when hatched being doomed to destruction in the absence of proper aliment. Man, in the course of his evolution, has become undoubtedly the most potent selective factor, but all his work has to be done on lines laid down for him by the insects, in so far as fertilising contrivances and specific floral forms are concerned, and it is in this connection that by far the greatest diversity exists. All he can do is to manipulate these types, and now and again blend them by hybridisation, increase their size and development by selection, take advantage of "sports," or indications of variation of less marked character, work up extra-petalled blooms into double ones, and so on; but he cannot contrive to alter the fundamental generic difference, the dragon's head of the antirrhinum, or the weird forms of the aristolochias he cannot evoke, or the thousand and one other peculiar shapes which, somehow or other, we are forced to assume have arisen through some subtle response to the tastes or habits of the visiting insects, which, in their turn, have become modified as time went on to fit, the long proboscis of the fertilising moth lengthening as the trumpet of its associated flower increased in profundity. It is perhaps in the direction of colour that man is capable of eclipsing the insect predecessors. Here undoubtedly he has managed to introduce within the limits of a single species a gamut of colouration which we are hardly likely to find in natural flowers. In the primrose, for instance, he has contrived to obtain flowers of an almost pure blue from a stock which is normally yellow, an extremely rare association, and in the chrysanthemums and begonias, the range of tints, excluding blue, is almost infinite, embracing many colours which are hardly likely to occur anywhere in normal compositæ. Nevertheless, as we have said, when we come to the fundamental parts of the flower, the fine arrangements and adjustments which secure, as far as may be, cross-fertilisation, and, in any case, fertilisation of the seed, these persist throughout, except where totally eliminated by complete transformation into petals, as in true doubles. In the way of hybridisation man, in most cases, takes a line peculiarly his own, since he has brought together species indigenous to widely distant lands, and managed, in many cases, to mate them to great advantage. The insect, on the other hand, apart from the fact that it usually confines its visits to a limited range of species, is naturally precluded from carrying pollen to plants from one region of the earth to another, while, in any case, unless great precautions against self-fertilisation are taken, Nature sees to it that no cross occurs by subtle antipathies and structural arrangements.

MR. G. W. LEAK,
Chairman of the Committee of the National Sweet Pea Society.

Mr. G. W. Leak, whose portrait is given herewith, has for some years past been prominent among those who take an active interest in the fragrant and exquisitely beautiful flowers to which our present issue is so largely devoted. Mr. Leak, as manager to Messrs. Bath, Lim., Floral Farm, Wisbech, has a thorough acquaintance with sweet peas from the commercial point of view, and his presence on the Executive Committee of the National Sweet Pea Society has unquestionably been highly advantageous to that body. That Mr. Leak's work as a member of the Executive Committee was highly appreciated was proved to demonstration by the fact that at the recent annual meeting the committee submitted his name to the members for election as its chairman. The members accepted the committee's recommendation, and he was unanimously elected. We need hardly say that, while Mr. Leak is a sweet pea enthusiast, he does not by any means limit his attention to these flowers. He enjoys the manifold charms of sweet peas, and it may be assumed, appreciates their commercial importance, but he is not less alive to the attractions and usefulness of other classes of hardy plants in which he has long taken much interest. We heartily join with his many friends in wishing him a successful year of office.

Botanical Lectures in London.—A course of ten lectures on "The History of British Botany" was commenced at University College, Gower Street, W.C., on the 20th inst. This was on Stephen Hales, by Francis Darwin, Esq., F.R.S

The remaining nine lectures will be as follows: January 27, Nehemiah Grew, by Dr. Agnes Arber, F.L.S.; February 3, Morison and Ray, by Professor S. H. Vines, F.R.S.; February 11, Sir William Hooker, by Professor F. O. Bower, F.R.S.; February 17, Robert Brown, by Professor J. B. Farmer, F.R.S.; February 24, William Griffith, by Professor W. H. Lang; March 3, J. S. Henslow, by the Rev. George Henslow, F.L.S.; March 10, W. H. Harvey, by R. Lloyd Praeger, Esq.; March 17, Arthur Henfrey, by Professor F. W. Oliver, F.R.S.; March 24, W. C. Williamson, by Dr. D. H. Scott, F.R.S. The lectures are free, and will be given in the Botanical Department, University College, on Fridays, at 5 p.m., with the exception of that on February 11, which will be at 10 a.m.

Horticulture in Edinburgh.—At the annual general meeting of the Royal Caledonian Horticultural Society, held in Edinburgh on the 12th inst., the Secretary read a report of the joint committee formed of members of the Royal Caledonian Horticultural Society and the Scottish Horticultural Association to consider the question of amalgamation. The committee expressed themselves as being unanimously of opinion that it would be in the interests of horticulture generally to have the work carried on in Edinburgh by one strong society rather than by two, as at present, and they would have no hesitation in advising the Council to proceed with such a scheme. With regard to the suggestion that both associations might be dissolved and a new society formed, the committee were met with difficulty in the case of the Royal Caledonian Society, as under its charter the society had no power to dissolve. The Secretary for Scotland on being consulted said that there was no precedent for assenting to surrender of the charter, and the proposal was open to serious objections. The meeting decided to leave the question open. The report stated that the balance in excess of income over expenditure was £78. Mr. Stewart Clark was elected president for the year.

An English Forestry Association is, at the instance of Mr. M. C. Duchesne, superintendent of Burnham Beeches, in process of formation. A preliminary meeting was held at the Surveyors' Institute on Thursday evening, with Lord Clinton in the chair.

Experimental Potato Culture.—Mr. W. J. Grant, director of agricultural and horticultural education in Monmouthsire, contributed a large collection of potatoes to the meeting of the Royal Horticultural Society on Tuesday, which was of interest as illustrating the experiments that were conducted in Monmouthshire during 1910. At the New House Farm the experiments appear to have been carried out with a view to determine the relative merits of Irish and Scotch seed tubers. In the trial in which artificial manures were used, the heaviest crop was produced by Eldorado from Irish seed; Factor from Scotch seed, and Duchess of Cornwall from Irish seed being second and third. Royal Kidney, owing to its freedom from disease, proved, as in previous years, to be a valuable potato for soils from which it will cook well. Both Eldorado and Royal Kidney were quite free from disease, and this was attributed to the crop having been lifted previous to the wet weather having set in. In the cultivation of potatoes on the same farm without artificial manures it was, according to the report, proved that the flavour, quality, and keeping properties of potatoes grown without artificial manures are better, but less in bulk, than those to which artificial manures were applied. The yield of the potatoes grown without artificials was about two tons less per acre than of those which had their aid. The varieties grown in the comprehensive trials on the White House Farm, Llanvair, were subjected to cooking tests with the following results. The best flavoured varieties were—First earlies: Early Favourite, Eclipse, Edina, Ideal, Veitch's Ashleaf, and Webber's Early; second earlies: Aberlady Early, Conquest, Royalty, Russet Queen, and Supreme; maincrop varieties: Dalhousie Seedling, Goldmine, Mayfield Blossom, Superlative, The Admiral, The Provost, Windsor Castle, Dalmeny Acme, Princess Alexandra, and Dalmeny Regent. The Llanvair crop was practically free from disease, and this was attributed to the potatoes having been sprayed three times and the tubers lifted early.

The Libra Peach.—Mr. Will Tayler, of Hampton, writes: "There is a curious reference to the Libra Peach in Mr. C. H. Curtis's description of the beautiful gardens at Sutton Place, Guildford. If Mr. Goatley finds the fruits are not so good as a turnip, the trees must be starved. All varieties which receive insufficient nutriment or moisture are poor eating, in my opinion, the more so when there is no sustained warmth from the sun until he has dropped to the September angle." We may point out that the reference is to an article that appeared in our issue of January 7. On p. 9 note is made of "an orchard of young standard fruit trees that was planted chiefly for the sake of the blossom display in spring time, though, of course, there is no objection taken to the fruit that may follow. Some large trees of the Libra peach out in the open here look in first-rate condition, but Mr. Goatley suggests that a good turnip is better eating than a Libra peach from these trees." In other words, this peach is not a success at Sutton Place planted out in the open. Planted against a wall in a favourable position the peach is a good one, as evidenced by the Award of Merit it has obtained from the Royal Horticultural Society.

Elm Tree on Fire.—Early in the morning of the 12th inst., one of the large elm trees on the breadth of turf between Rotten Row and the Serpentine at the western end of Hyde Park was found to be on fire. An alarm was given, and as the fire engines were quickly on the spot and a supply of water from the Serpentine readily available, the fire was soon extinguished. As the flames appeared to burst from all parts of the tree, the effect is said to have been very good from the spectacular point of view. We have no information as to the cause of the fire.

Wimbledon and Putney Commons Extension Fund.—The secretary of this fund, Mr. Richardson Evans, The Keir, Wimbledon, writes us as follows: "At the last meeting of the Wimbledon Borough Council, it was proposed to rescind the resolution by which a contribution of £10,000 was voted to the Wimbledon Common Extension Fund. The ground assigned in the motion for revoking the grant was that it had been sanctioned on the understanding that the Surrey County Council would assist, and that the Surrey County Council had, in fact, declined to assist. The Mayor, who presided, said it was his duty to state that the grant had been made unconditionally and without any reference to the course that might or might not be taken by the Surrey County Council. In the course of the debate it was stated that the decision of the Surrey County Council was not final, and that the matter would be reconsidered after a suitable interval. The only division taken was on the motion 'that the question be now put.' The Ayes were 14; the Noes were 4. The supporters of the motion for rescinding the grant formed the minority. The proposer of the motion claimed the right of replying, and, as only five minutes remained, he talked the subject out."

British Gardeners' Association.—During the past year the association has made greater progress than usual. Three hundred and fifty members have been elected, bringing the total up to 1,964 at the beginning of December. It is anticipated that early in the present year over two thousand gardeners will have joined the association since its formation. The monthly journal has been increased in size, and the Executive Council have adopted a scheme for the examination of professional gardeners, the first to be held on Wednesday, April 26, at 7 p.m.

A Trial of Potato Diggers will be held by the Royal Agricultural Society in the autumn of the current year.

Parks in America.—The annual report of the Board of Commissioners of the Parks belonging to the City of Boston is of much interest to those who are engaged in the management of open spaces in populous centres, and indeed to all who appreciate their importance. The Commissioners express regret that the citizens of Boston fail to fully appreciate parks that are not well within the influence of the sea breezes. They say, in the course of their remarks upon this point: "Franklin Park lacks the presence of the ocean, and the sole fact that it is very beautiful seems insufficient to bring people to it in fair proportion." Much attention is devoted to the provision of playgrounds in the Boston parks, and the report contains illustrations of five of the most useful and attractive of the buildings provided for the use of children.

Gypsy and Brown-tail Moths.—These moths are still very abundant in the United States, and their caterpillars are so destructive to tree life in many parts of the country as to render repressive measures essential. Combating the moths and their caterpillars involves a heavy expenditure on labour and materials when the area to be dealt with is large. In his report to the Board of Commissioners, Mr. J. A. Pettigrew, the superintendent of the Boston parks, states: "We have succeeded in combating these pests so successfully that serious damage has been avoided. The cost, however, is a serious tax on our resources, being last year 15,499.21 dollars (one dollar =4s. 2d.); the amount of arsenate of lead used was thirty tons. The whole system was sprayed, and infestations are now only to be found on the borders where pupating larvæ crossed over from neighbouring property."

New Pleasure Ground for Sutton.—Mr. J. W. Hartley, of Sutton Hall, Keighley, Yorkshire, who died in November, 1909, left, under certain conditions, freehold land containing about four and a-quarter acres for the purposes of a public park or recreation ground. He also left a sum of £1,000 for laying out the ground, and £1,000 upon trust for investment and to apply the interest in the upkeep of the ground to the Sutton Parish Council. Mr. Hartley imposed the condition that no public meetings are to be allowed in the park.

SOME NEW SWEET PEAS.

With a view to assist those of our readers who are desirous of including some of the newer varieties in their selections of sweet peas, we herewith illustrate a few of the finest novelties that came under our notice in the course of the summer of 1910. A considerable proportion of them have received awards from the Royal Horticultural Society or the National Sweet Pea Society, and in some cases from both, and they may all be purchased and sown with the full assurance of their proving distinct and in other respects satisfactory. They do not exhaust the list of meritorious varieties of recent introduction, as will be gathered from the articles by Mr. T. Stevenson and other successful cultivators which appear in this issue.

Charles Foster is properly regarded by experts as one of the finest of the many beautiful sweet peas that have been introduced to cultivation within recent years. It is certainly a variety that should be obtained and grown well, for the flowers are of high quality and exquisite in colouring, the colours being best described as pastile pink. It was raised by Mr. R. Bolton, of Warton, Carnforth, who exhibited it remarkably well at the National Sweet Pea Society's exhibition in 1910. In the previous year the variety received an Award of Merit from this society.

Cherry Ripe.—A variety of great beauty and remarkable for its finely-developed flowers and its distinct colour, the latter being a pleasing shade of rich cerise. Raised by Messrs. Gilbert and Son, of Dyke, Bourne, Lincolnshire, it received an Award of Merit from the National Sweet Pea Society in 1910.

Colleen.—A charming bicolor, well deserving hearty commendation. The size and high quality of the flowers are well shown in the accompanying illustration, and it will suffice to say that the standard is bright carmine-red, and the wings blush-pink. Colleen is one of the excellent varieties raised by Mr. W. Deal, Brooklands, Kelvedon, and an Award of Merit was made in its favour by the Royal Horticultural Society in 1909, and last year it was commended by the National Sweet Pea Society in the same year for its value for garden decoration.

Maori Belle.—A variety of considerable interest from the fact that it was raised in New Zealand, and has come to this country with a high recommendation. It is described as "a glorified giant Mrs. Walter Carter, of vigorous growth, very floriferous, and comes with 40 per cent. of fours daintily poised on long stalks." The standard and wings are said to be pale lavender "devoid of purple or metallic sheen. This variety was raised by Mr. C. Trevethick, Wellington, New Zealand, and has been introduced to this country by Mr. G. H. Mackereth, of Ulverstone.

Marion Cuthbertson. — A charming variety remarkable for the large size and fine form of its flowers. The colour is a beautiful shade of rose-pink. Raised by Messrs. Dobbie and Co., of Edinburgh, this variety ranks high among the many fine sweet peas that have been raised and introduced by the firm.

Stirling Stent.—A remarkably fine addition to the orange-coloured section which created much interest at the National Sweet Pea Society's exhibition in 1910, where it was finely shown by Mr. W. E. Alsen, Densmead, Hants, whose arrangement was illustrated in our issue of July 16, 1910. The variety was raised by Mr. J. Agate, of Havant, and the National Sweet Pea Society in 1910 awarded it a First Class Certificate and the silver medal offered for the best sweet pea of the year. The illustration represents two spikes of flowers.

Paradise Apple Blossom.—A variety that claims special attention for the distinct and beautiful shade of colour it affords. The flowers are of full size, with finely waved standards and wings, and the standard is rose-pink and the wings blush-pink. The variety was raised by Miss Hemus, Upton-on-Severn, and received an Award of Merit from the Royal Horticultural Society in 1909.

Thomas Stevenson.—A variety of a high degree of merit, that has the promise of taking a foremost position in the orange-scarlet section. The flowers are large, of fine form, and the colour is brilliant orange-scarlet. It was raised by Mr. R. Holmes, of Norwich, and is being distributed by Messrs. R. Sydenham, Lim., of Tenby Street, Birmingham.

SWEET PEA PARADISE APPLE BLOSSOM.

Raised by Miss Hemus, and received an Award of Merit from the Royal Horticultural Society in 1909. The colour is light rose-pink.

THE FUTURE OF THE SWEET PEA.

"This also will pass away"
—(Persian saying).

We are at present marching towards purity and fixity in sweet peas, and in the future both will be attained. In the future there will not be the insane yearly rush of novelties on to the market which we see at present. The public will have got tired, and for all but a few novelty producing will have ceased to be profitable. I am thoroughly at one with the sentiment so well expressed by Mr. C. H. Curtis in your columns a few years ago, that the future of the sweet pea will rest with those who control the purest and best stocks. We all know what is meant by the purest stocks—stocks true to type and colour. The "best stocks" is an expression not so unequivocal, but the growers who work for size of flower, substance, or quality, uniformity of fours, or even fives, brightness of colour, vigour, and length of stem, are those who are going to extend their reputation.

SWEET PEA COLLEEN.
Raised by Mr. W. Deal, and received an Award of Merit from the Royal Horticultural Society, and a Commendation from the National Sweet Pea Society in 1909. The colour, blush-pink and carmine.

Now that the older varieties are being remade, these desirable qualities are being achieved. Let me explain what I mean by being re-made. Every raiser who is breeding scientifically is raising, say, Etta Dyke, Clara Curtis, and Countess Spencer every year, and he is constantly on the outlook for seedling forms of these and other varieties which are better than the original in some slight way—the very fact of being crossed seedlings presupposes renewed vigour. It is needless to say that one requires to be an expert of the first water to do work of this kind successfully (I am not claiming this for myself, gentle reader).

What about new colours? There are some new colours, and any number of new combinations of present colours yet to be worked out of the sweet pea, as we presently know it, but I do not think any striking new colour, such as bright yellow, will be evolved from Lathyrus odoratus. If, by hybridisation, some new factor can be introduced into its constitution, a new epoch may arise, and a departure come about as valuable and interesting as the advent of the Spencer type. I am in full agreement with Mr. Edwin Molyneux, Mr. Walter P. Wright, and Mr. Thomas Stevenson as to double standards in sweet peas. I think it would have been better if the National Sweet Pea Society's Conference had decided to ignore them, even to discourage them in competitions until they had been developed sufficiently to form a class by themselves. But the Conference did not go very far on the wrong road. It only decided that "double standards shall not be discounted." I don't expect they will be premiated by many judges. I believe double standards will "come to stay" in the future. I have seen some very charming things in them. I saw in London last summer a pure white double standard which was exquisite. I saw at Duns a fine double form of Tortoiseshell, or Nancy Perkin, which, when two or three sprays were bunched together, gave a patch of the most glowing colour I ever saw in sweet peas. At Marks Tey double forms of Countess Spencer and Constance Oliver have been grown for some years, and are apparently quite fixed. I have the opinion of Mr. George Munro that the double standard forms will be very acceptable to market men, and if they take on with the public, through being more lasting when cut than any other type, the popularity of the sweet pea will greatly increase.

This brings me to another most important point, which I hope will not be lost sight of in the future—the preservation of the delightful perfume of the sweet pea. Raisers would be well advised to watch this factor, or should I say element, and see that it is retained. There is yet one more point I think worth considering, and that is the height of the plants. I feel something ought to be done here. A plant beginning to bloom at eighteen inches or two feet, and not growing more than six feet, is surely tall enough—when we get them to twelve, fourteen, and sixteen feet, they are then too tall for human nature's daily food!

I do not see at present what is coming along to eclipse the sweet pea—nothing certainly among annuals—but fashions change, and new men, like new times, bring new manners.

WILLIAM CUTHBERTSON.

Grapes at Tyntesfield.—You do well to emphasise the value of what Mr Wilkinson has done in the renovation of vines and the improved production of grapes since he took charge of the gardens at Tyntesfield. I am certain, too, that much more good of a similar character might be done with vines in many gardens by renovating rather than by removing them entirely and planting new canes. There is a tendency at the present time, especially amongst the younger members of the profession, to root out rather than improve the existing canes. So many instances of the rapid improvement of existing vines can be seen that I am sure gardeners generally would be well advised to consider the probabilities of the future before taking the drastic step of entire removal. When we consider what has been done with the old vine at Hampton Court by renovation, surely such an example should have an influence upon present practice. The vineries at Tyntesfield are lofty, and generally on a large scale, and by a thorough reorganisation of the rooting space and mulching coupled with a judicious method of pruning Mr. Wilkinson has, since my visit there staged many grand examples of grapes which I have seen at the various shows.—E. M.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

SOLD IN BAGS AND TINS BY SEEDSMEN, NURSERYMEN, ETC.

SWEET PEA ENTHUSIASM IN SCOTLAND.

There has been an extraordinary wave of enthusiasm in the culture of sweet peas all over Scotland within the past few years. It started in the Border town of Duns, where Mr. Thomas Duncan and Mr. Alex. Malcolm, well known enthusiasts, whose names are familiar to every sweet pea grower, are still growing and helping to foster the culture of their favourite flower. The former still grows a very large quantity of peas, but has almost given up competing, and the latter is winning as much fame to himself in the raising of new varieties as he did in the past on the show boards, and, along with the Rev. J. M. Simpson, of Edrom, has sent out such varieties as Edrom Beauty, Masterpiece, Mrs. Malcolm, Isobel Malcolm, and there are other good things to follow.

Nowhere in Scotland has enthusiasm burned more brightly than in Perthshire, and the natural result has been the formation of the first Sweet Pea Society in Scotland. The society owes its origin to the hon. secretary, Mr. R. S. Halley and the hon. treasurer, Mr. A. M. Mechie. The former, being in the habit of attending many of the local shows, thought that the time was ripe for the formation of a society to bind the growers together, and, with the assistance of Mr. Mechie, drafted a circular calling a meeting (under the convenorship of the Rev. J. S. Clark, Bridge of Earn) of all interested in the culture of the sweet pea. The meeting was well attended, the society was launched, and officials elected and, after much discussion, the classes were thrown open, and the result justified the decision.

As to the progress of the society one cannot do better than quote part of the report for last year, given at the annual general meeting: "Just a year ago to-day saw the birth of the Perthshire Sweet Pea Society, the first of its kind in Scotland. It was launched with great enthusiasm by a fairly representative gathering of sweet peaists, and we are glad to be able to record an unabated enthusiasm among its members. During the past year no fewer than 144 members have been enrolled in Perthshire and the surrounding counties, from Forres in the north right down to the Borders. Our list of patrons is exceptionally good, there being a total of thirty-eight, and all keenly interested in the society. We have also been very fortunate in having a splendid working committee, gentlemen who have spared neither time nor expense in attending the meetings held in Perth. The society's first schedule was a good one, and many complimentary things were said of it by the foremost growers in Scotland, and the society is much indebted to the president, the Rev. J. S. Clark, and Mr. W. A. Morison, Newburgh, for the help they gave the secretary in compiling the same. The society's first exhibition was held in Perth on Saturday, July 30, 1910. The opening ceremony was performed by the Countess of Moray (in the unavoidable absence of the president) in the presence of a large and fashionable gathering. The exhibition, from a floricultural point of view, was a very great success. The large marquee was taxed to the utmost, and Mr. W. Cuthbertson (who assisted Mr. W. P. Wright by judging the small growers' section) remarked that a marquee half as large again would not have been too large for the beautiful and fragrant display. There were nearly 200 entries, representing close on 1,000 vases, and all the classes were keenly contested. In the small growers' section the class for six vases brought out no less than twenty-three entries. The quality of the exhibits, generally speaking, were of a very high order."

The show brought the cream of Scottish growers together, with the exception of Mr. Gilbert Kerr, of Langton, and Mr. Charles Shaw, of Bogahan. The Borders were represented by Mr. Thomas Duncan, of Fogo, who simply could not stay away. The society's cup was won by Mr. Thomas Fender, of Caltoquhey, Crieff, with a grand lot of flowers, scarcely so strong as the second lot, but what they lacked in strength was more than made up in freshness and colour; the runner-up was Mr. George Reid, of Downfield, Dundee, who is a grower of the first rank, and he has had a wonderful season of successes. He started exhibiting at the N.S.P.S. Show on July 13, and continued right on to September, winning nearly all the honours wherever he exhibited. The Rev. Harold Mayall, Comrie (this year's president of the Perthshire Sweet Pea Society) was remarkably well represented in the prize list; he made a capital début in the large growers' section, and will be a force to be reckoned with in keen competition wherever he exhibits in the future. Another coming grower who did well at Perth is Mr. W. Young, Falkland Palace, Fife; he showed excellent blooms, and ran in third place for twelve vases, and also won honours in other classes. Mr. W. A. Morison, Newburgh, is an enthusiast who grows

SWEET PEA THOMAS STEVENSON.
Raised by Mr. R. Holmes. The colour is rich orange-scarlet.

and exhibits very fine flowers, and he is one of the leading lights of the Perthshire S.P.S. Further north, Mr. J. S. Adams, Brechin, and Mr. D. Milne, Drumald, Montrose, are rapidly coming to the front.

When at the Aberdeen show in August we had the pleasure of seeing some very fine flowers staged, notably by Mr. J. Grigor, Seapark, Forres. Perth Show was rather early for him, but he was in prime condition at Aberdeen, when for length and strength of stem, and substance, combined with colour and freshness of flower, he was fit to win anywhere. Deeside was represented by Mr. R. Petrie, Crathes Castle, who showed capital blooms, although a trifle weather-beaten. Other keen growers on Deeside are Mr. J. Crozier, and Mr. R. Reid, of Durris House. In East Aberdeenshire we have Mr. Robert Gordon, of Ellon, a grand grower, who turns out wonderful blooms: such, in fact, as are not often seen on the exhibition stage. Another keen sweet peaist is the Rev. Mr. McKenzie, Methlick, a grower who, with a little more experience in staging, will prove a tough opponent. Coming into Banffshire, Mr. R. Morton, of Cullen House, is a grower who will shine in any company: we had the pleasure of seeing his plants just coming into bloom in the beginning of July, and were delighted with their strong, healthy appearance. In Inverness-shire the sweet pea is extensively grown, and when at the show in the Highland capital we were not surprised to find that sweet peas were certainly the feature. Mr. W. L. Reid, of Cantray, and Mr. E. G. Fraser Tyler, of Auldewrie, are growers who ought to come down further south and cross swords with the Lowlanders. Miss Burns, of Drummond Hall, obtains fine length of stem and grand substance of flower, fit to take honours in much keener competition. Miss Fraser, of Moorlands also grows very fine flowers, and made a capital runner-up to Miss Burns.

R. S. HALLEY.

SWEET PEA MARION CUTHBERTSON.
Raised by Messrs. Dobbie and Co. The colour is rose-pink.

SWEET PEAS IN SMALL GARDENS.

The sweet pea is without doubt the Queen of Annuals, and its proud position is not so much due to its importance as an occupant of the largest and most efficiently staffed gardens as to the fact that it is a flower that can be easily and successfully grown in any town or suburban garden where flowers will grow at all. The sweet pea calls forth intense enthusiasm from vast numbers who possess only limited opportunities for cultivating it, and it is to these growers that the present notes are addressed.

Many have already sown their seeds in the autumn, and have prepared their sites for next year's display, but the majority have made no such preparations, so that it is not too late to offer advice as to the best positions for sweet peas in small gardens. Where the whole of the plot is devoted to sweet peas, it will be found advisable to grow them in rows about six feet apart, and, preferably, running from north to south but where the peas are grown in borders among other flowers, clumps give by far the finer effect, although they are somewhat more troublesome to attend to. The use of sweet peas for hiding unsightly objects or fences is too well known to need much comment, but I should like to call attention to the frequent mistake of growing a row of sweet peas within a few inches of a fence. The results will be far finer if a space of at least two feet is allowed between the plants and the fence. Growing other flowers close to the sweet peas is another frequent source of comparative failure. If possible, it should be arranged that the neighbouring plants, even when they have made their full growth, do not come within at least two feet of the sweet peas. Shade from the midday sun is not always a disadvantage, especially in the case of varieties that lose colour easily, but sweet peas should not be planted directly under trees.

Very good results can be obtained from soil that has only been dug one spit deep, but it is an advantage to grow the plants in soil that has been dug to a depth of two or three spits. When the soil is trenched, however, it should be trenched all over, and not simply in a narrow strip a foot or eighteen inches wide. In wet seasons especially this latter method frequently does more harm than good. The sweet pea delights in a rich soil, but the manure should be thoroughly mixed with the staple, and not left in layers an inch or so thick. Where sweet peas are grown a dressing of lime is of great value, especially in soils that have been given animal manure for a number of years. The addition of bonemeal is also highly beneficial. Those who are able to trench their soil should work the bonemeal into the top spit, the animal manure being kept below the top eight inches. In the majority of soils it will be wise, when trenching, to keep the old top spit still on the top.

Those who do not trench their soil, and they will be by far the most numerous, should dig it over thoroughly, and remember, especially if they delay their preparations, that on no account must undecayed manure be used so that it comes into close contact with the young roots.

The great aim is that when the planting time comes the soil shall be of good tilth, and ready to fall to pieces at a touch, and be at the same time fairly firm. Good results cannot come from a loose soil, so that any trenching should now be completed as soon as possible to allow the soil to settle. If necessary the ground should be trampled down to make it firm, but only when it is dry. To attempt to work on a clay soil while it is wet is very unwise.

It is the general experience that autumn sowing gives the best results, but good results are also obtainable from spring sowings. If possible, the seeds should be sown under glass, in pots or in boxes about five inches deep, at the rate of about five seeds in a 48-sized pot. It is wise to place the pots in a slightly warmed structure, otherwise there is a liability of the seeds rotting, but as soon as the plants are through the soil they should be placed in a cold frame. While here, the amount of air given them should be gradually increased until the lights are left off altogether, except in frosty or wet weather. In the earliest stages great care is needed to guard against over-watering, which frequently causes seeds to rot, especially the spotted and white seeds.

Provided that the plants have been thoroughly hardened off, they can be planted out as early in April as the soil is in good condition to receive them. A single row, with the plants nine inches apart, will be suitable for most gardens. Some growers raise only one plant in each pot, so as not to disturb the roots, but there is practically no advantage over several in a pot if the roots are carefully shaken apart.

When the seeds are sown in the open ground the great thing is to choose a day when the soil is in good condition. The earlier this can be done in March the better, although there are many who wait until April, or even May. If the seeds are cheap the best plan is to sow two or three inches apart, and thin out to six or eight inches apart when the plants have grown a week or two. The grower must be constantly on guard against birds, slugs, and mice, as either of these will destroy sweet peas altogether, and the danger commences as soon as the seeds are sown.

Hazel or similar boughs are suitable and convenient for the plants to climb up, but are not always obtainable. Wire netting is an efficient substitute, and is not more expensive in the long run, as it can be used several years. Great care should be exercised to ensure that the supports are absolutely firm, so as not to blow down at any time. While the plants are young they will need a little help to enable them to commence climbing. It should be remembered that well grown sweet peas generally reach a height of six feet, and frequently several feet higher, and sufficiently high support should be allowed them.

Throughout the season the hoe should be kept at work near the roots, and early in June a slight mulching with decayed manure should be given, and this can be increased later on. It is unwise to give any extra manure until the plants are in flower, and even then great care must be exercised not to use too much. Soot water and the diluted liquid obtained by soaking horse manure in water are excellent, but, as a general rule, such stimulants as nitrate of soda and sulphate of ammonia are best left alone by the amateur. Liquid manures should not be given when the soil is thoroughly dry, but the ground should be first watered with clear water. It is not wise to commence watering until the soil is fairly dry, and then it should be thoroughly done. Just sufficient water to wet the top three inches is worse than none at all.

SWEET PEA CHERRY RIPE.

Raised by Messrs. Gilbert and Son, and received an Award of Merit from the National Sweet Pea Society in 1910. The colour is a lovely shade of cerise.

Before concluding let me remind the owner of a small garden that a good selection of varieties is most important, and that it is wise to obtain the seed from a reliable source. Good stocks of the following varieties should be obtainable at a reasonable price from most first-class seedsmen, and they can all be thoroughly recommended: Nora Unwin, King Edward VII. Spencer, Asta Ohn, Evelyn Hemus, Countess Spencer, Helen Lewis, Constance Oliver, John Ingman, Princess Victoria, Tennant Spencer, Elsie Herbert, and Mrs. Andrew Ireland. Four good additional varieties, somewhat more expensive, are Mrs. Hugh Dickson, Edna Unwin, Tom Bolton, and Clara Curtis. America Spencer is a very good striped variety, and Maud Holmes or Sunproof Crimson are worth the extra price in place of King Edward Spencer.

G. F. Drayson.

1912

THE SWEET PEA AS AN ARTICLE OF COMMERCE.

However much the introduction of the commercial element is to be deprecated in connection with the beautiful products of Nature, human environment demands adequate facilities for their distribution amongst the lovers of the beautiful. Hence it follows that intelligence and skill must be applied to the performance of this use and the necessary materials provided for its successful accomplishment. In all honourable work it is a well-established principle that "the labourer is worthy of his hire," and surely no work can be more praiseworthy and honourable or more deserving of reward than helping to develop the love and enjoyment of the beautiful by placing the possibility of its enjoyment within the reach of all, and that is where the true commercial spirit has full right to enter.

The early history of the sweet pea clearly shows that for many years the work was conducted along these lines. It is earnestly to be hoped that this spirit may ever continue to animate those who are engaged in disseminating the seed of this lovely flower, and that the day may never come when the mere money grubbing element will be permitted to prevail.

For many years after its introduction into this country the seed of the sweet pea appears to have had very little interest for seed dealers, and, as a result of my researches into the early history of the flower, I find that it was not offered as an article of commerce until 1730. In that year Robert Furber, gardener, of Kensington, published "A Short Introduction to Gardening, being several useful Catalogues of Fruits and Flowers." At the same time Furber also published, by subscription, a set of twelve very fine engravings under the title of "Twelve Months of Flowers." The work was dedicated to

"H.R.H. Prince William of Cumberland,

"Their R.H. Princess Mary and Louisa."

"The Nobility and Gentry and other subscribers, and amongst the latter are the names of Sir John Evelyn and the Rev. Isaac Watts, D.D."

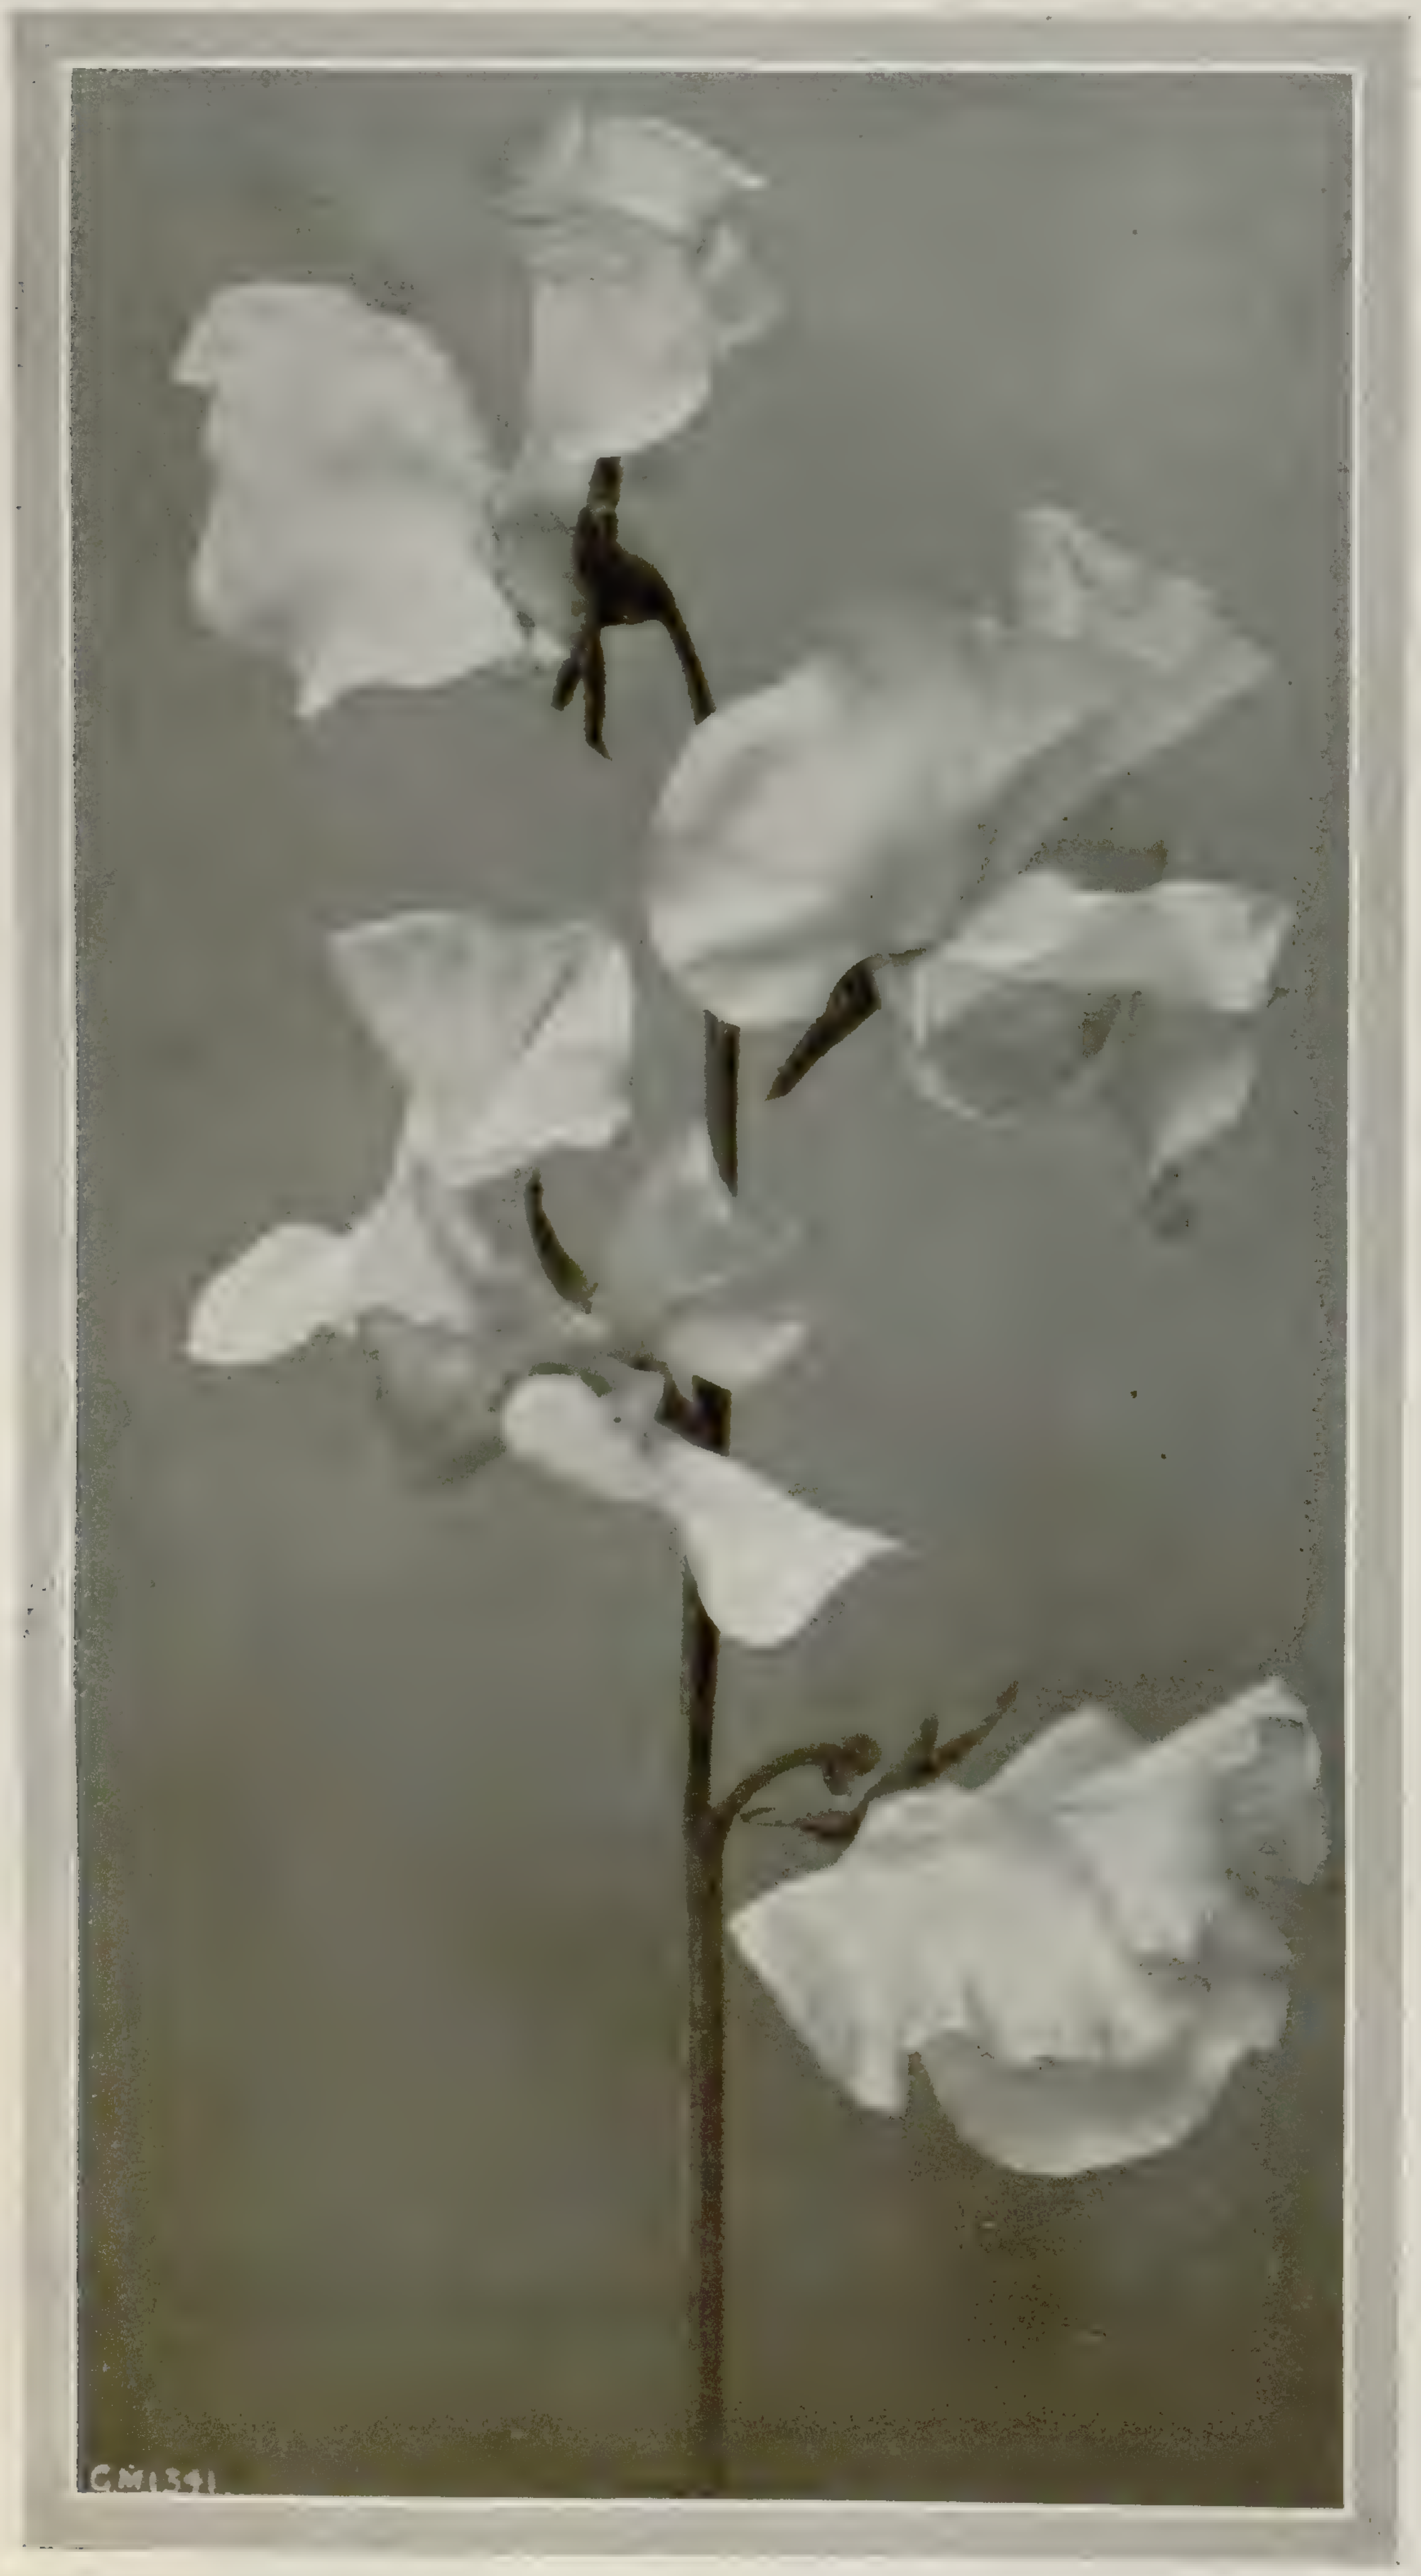
The interesting point in connection with sweet peas is an illustration of the only variety known at that time in the plate for the month of June. A reproduction of the plate appears on page 51, and the sweet pea is No. 33 on the right-hand side. The form is certainly grotesque if judged by twentieth century standards, but it closely resembles Commelin's famous drawing which appeared in 1700.

Looking back over the two centuries that have intervened, I am of opinion that a pardonable feeling of envy of the ease with which Furber could fill his sweet pea orders, having only one variety to provide, will frequently pass through the minds of those whose duty it is to furnish the many hundreds of varieties that exist at the present day.

This naturally leads to the purely commercial side of the question. The Editor of the Gardeners' Magazine has kindly asked me to give, as near as possible, an estimate of the supply of sweet pea seed to-day. The task is one of very great difficulty, but, judging by facts under my personal observation, and the acreage which is annually devoted to their culture, the world's produce must be nearly 500 tons.

The greater part of these are sold in America, where they form the most important item in the flower seed section of the commission seedsmen's boxes. Great Britain and her many Colonies also use immense quantities, for it is as easily grown by the cottager as the prince. In Germany there is a growing demand, especially for the early-flowering section: Scandinavia has also entered the lists; France is much interested in the Cupid section; and some day, perhaps, even Italy will join the ranks of its admirers, and thus remove the reproach which rests upon it while it remains like the prophet, "without honour in its own country."

S. B. Dicks, F.R.H.S.



SWEET PEA CHARLES FOSTER.

Raised by Mr. R. Bolton, and received an Award of Merit from the National Sweet Pea Society in 1909. The colour is an exquisite shade of pastile pink.

Vine Eyes.—These may be put in now, or any time during the next month, and the sooner they are started the longer will their season of growth be. Select good plump eyes, and cut them, wedge-shaped, out of the shoot, and place in small pots containing some fine sandy loam and leaf-soil, or, if a quantity be required, they can be put in pans or small seed trays, and placed in a propagating frame with a brisk temperature. But as soon as they begin to grow they must be moved to a more airy place near the glass.—W. A. Cook.

Engrav'd by H. Fletcher.

THE FIRST ILLUSTRATION OF A SWEET PEA OFFERED FOR SALE.

A reproduction of the June plate in "Twelve Months of Flowers," designed by Peter Cassteels, engraved by H. Fletcher, and published by Robert Furber, at his nursery over against Park Gate, Kensington, London. Our reproduction is from a copy in the possession of Mr. S. B. Dicks, F.R.H.S., and the sweet pea is seen at the lower right-hand corner.

THE NEWER SWEET PEAS.

That the sweet pea is still growing in popular favour is amply evidenced by the great demand for new varieties, and so long as raisers can produce those that are actually new and interesting the cult of the sweet pea will move forward.

I am optimistic enough to think that we are a very, very long way from the time when the sweet pea will lose popular favour, and in support of this we only need take a very cursory glance through the present season's list of novelties. All of the varieties will not prove gems of the first water, but there are several which I am quite sure are really great advances on those that are now at the head of their various colour classes, and I should say that better things have been secured, and apparently fixed, than has been the case for the past three or four seasons.

Of many we cannot possibly have seen the best, as the past season was anything but ideal for testing the merits of the peas, though perhaps in the matter of growth it was one of the best on record, but the cold drizzling weather, with an occasional bright day, kept the flowers in the worst possible condition for proper comparison. But even under these conditions many of the varieties under review stood well out from among their neighbours.

From a seedsman's point of view, it could hardly have been worse, and many varieties that early in the season gave every promise of yielding a good crop of seed, failed miserably, and so all enthusiastic amateurs are the sufferers, either by not being able to obtain seed of their pet new varieties at all, or by having to pay much more for what they have, or hope to have, and lucky, indeed, are they who made up their minds early, gave their order in, and thus got first call on what little seed there was. But as many of the varieties offered this season were held over from last year, I hope that everyone will obtain at least the best of the novelties.

In giving a description of some of the newer varieties I do not wish it to be understood that these are all the new varieties that are worth buying, but a description of a few that I know to be really good, at least from my point of view, and were it to include half of those that I think good, or pretty, the list would need to be an extensive one.

As a really new and distinct variety pride of place must be given to Charles Foster (Bolton), and though I had seen this variety two or three times before, the beautiful form in which it was shown at Vincent Square will long impress me, and, I might say, it appealed to me more than any pea I have seen; the delicate shadings of lilac and pink, with that metallic hue on the edges of the wings and standard forming an extremely beautiful combination of colours. I think this variety will need really good and skilful cultivation for the show bench. Another new variety in what I call the lilac shades is Bertha Massey, first shown by Messrs. Bide under the name of Mrs. Ryle. It is of a very pleasing shade of lilac, which appears to stand the weather very well, and the flower is quite up to exhibition size.

Red Chief, another of Mr. Bolton's introductions, is quite a new break in the very dark or maroon shades, and the name under which it was grown at the sweet pea trials—Red Maroon very aptly describes it. The pale yellow keel contrasts well with the standard and wings, which are large, and of good substance; altogether an unique and desirable pea. Scarlet Monarch (W. Deal) promises to stand out well among the numerous varieties in this colour, being a brilliant shade of scarlet, which stands the weather well, and for a scarlet it is of good size. Red Star (Malcolm) is another new scarlet, much in the way of the first-named, perhaps not quite so bright in colour, and the flowers, if anything, are a trifle further apart. It will be interesting to note these two varieties during the coming season.

Maud Holmes (Sydenham and Holmes) is a very fine crimson; indeed, a perfect flower in every way, and though I grew this by the side of the two strains of Sunproof Crimson last year, I should hardly like to say which was the best. The former may be just a trifle the larger.

Compress (W. Deal) is a most beautiful shade of mauve, without that variation of colour we find in the Marquis, and I like this variety very much; the flower is large, and there is a fair percentage of four flowers on a stem. Helio Paradise (Hemus), and Queen of Norway (Bolton) are also two very good mauves, a trifle deeper in colour than Empress, but both produce very fine flowers, borne on good stems, and with high cultivation invariably give fours.

I do not remember a season when there were more varieties of lavender sweet peas being placed on the market. Some of them I have seen, others I have not, so should I appear to have overlooked something that is especially good, readers will know that I have not grown it, or seen it growing. Amongst the many I have seen none has impressed me more than Florence Nightingale (Burpee). I cannot recommend it on the score of being perfectly true this past season, but have great hopes for the future, and the best description I can give of it is that it is a glorified form of Lavender George Herbert, with, perhaps, a little more waving in the standard, and the very mention of Lavender George Herbert should be sufficient guarantee of the colour. Nettie Jenkins, sent out last season by Mr. Unwin, but perhaps not generally known, is a flower of much beauty, the very soft lavender of the flower being strikingly set off by a touch of white at the base of the wings and standard.

Anglian Blue is a pea which I think will be seen in good form this next season, the colour being a clear bright blue, practically the same as Zephyr and Kathleen McGowan, but as growing with me this last summer it was certainly a much larger flower, and of good substance, with the blooms well placed on the stems. What appeared to be a very nice pale blue was Guy Hemus, one of the many that Miss Hemus was exhibiting in these shades during the past summer The colour is about the same as that of Plumbago capensis, and if this is really quite fixed it should prove an acquisition, the flowers being quite up to exhibition size.

Isabel Malcolm (Dobbie) is a pea which will be much in demand for decorative purposes, the colour being practically straw yellow, and I can well imagine what a fine combination this and Guy Hemus would make in a vase—delicate, but none the less beautiful. Ivanhoe, another of the Messrs. Dobbies' varieties, is also a decorative sweet pea, much in the way of Mrs. Bieberstedt, but of quite Spencer form.

I must not forget the much-talked-of variety, Stirling Stent, which created such a sensation in July last on account of its colour. I feel sure, however, that Earl Spencer will beat it both in form and colour. I have no doubt this will be used a good deal for cross-fertilisation, as it is credited with being quite sunproof. Iris, one of Mr. Breadmore's introductions, is a very delicate sweet pea, best described as a very soft salmon, and though it may not prove of extraordinary value as an exhibition variety, it will certainly be much prized for decorative effects. Henry Eckford Spencer (Breadmore) is a variety of much merit, a bunch of it being very effective, and softer in colour than Earl Spencer, so that this, too, will be useful from a decorative point of view.

Afterglow (Bolton) and William Eagle (one of my own raising), are two peas that I should say are quite unique in colouring, the same colours predominating in both of them, viz., mauve and blue. In the former they are more or less mixed in both standard and wings, whilst in William Eagle the standard is a very pale mauve, and the wings of a clear shade of blue, the edges of both wings and standard being just touched with a metallic shade much in the same way as Rosie Adams.

We still have a few more pinks, all are beautiful, and it would be worth something to be able to say which is actually the foremost among Lancashire, Doris Usher, Mrs. R. Hallum, Anglian Pink, Lady Rose, etc., but no doubt we shall be able to judge these during the coming season, and they will, indeed, prove good peas if they oust Mrs. H. Dickson and Gladys Burt from the position these now hold.

The last pea I shall try to describe is the variety Thomas Stevenson, which was named after myself by Mr. R. Holmes, and is being distributed by Messrs. R. Sydenham, Lim.; this, as growing with me this past summer, is quite distinct from all the other varieties in this colour (orange), and though an individual flower may not look so deep as either Dazzler or Edna Unwin, yet in the bunch it is much the richest, having quite a golden glow over the orange. I see in one place it is described as an orange form of Helen Lewis. I cannot thus describe it, as the standard of the flower is broader and more upright, and certainly has more substance. The shape of the flower is very much like that of Mrs. Andrew Ireland, but it is a much stronger grower than this variety, and, I might mention here, that it gains in colour until the flowers are fully expanded.

If growers were limited to this little list alone I feel sure they would be able to exhibit well, but with these, and a good sprinkling of our older friends, such as Evelyn Hemus, Elsie Herbert, Mrs. H. Bell, Mrs. H. Sykes, Countess Spencer, Etta Dyke, John Ingman, Clara Curtis, etc., we ought to be able to put up quite a formidable lot, always providing the weather will treat us a little more kindly than it has done during the past two seasons. Most, if not all, of the varieties mentioned in this list I was able to sow late in October, and am pleased to be able to say that in nearly every instance they have germinated quite 95 per cent., and, in some cases, even more. This, I think, is a striking testimony to the great care our seedsmen are taking with the seed they are sending out, as practically all the leading growers in the sweet pea trade are represented in my collection. I hope all growers are obtaining results as good, or better.

Thomas Stevenson.

Lobelia cardinalis.—In many gardens it is necessary to lift the plants and winter them in frames. The roots may now be placed in a warm greenhouse to induce them to make growth. As soon as this commences they may be pulled to pieces, and each shoot potted singly, three-inch pots being the most suitable, and a mixture of one-third loam, one-third leaf-soil, and one-third sand, thoroughly mixed, will be found an excellent rooting medium.—E. C. P.

THE DECORATIVE VALUE OF SWEET PEAS.

I am glad to have been asked to say a few words from a decorator's point of view upon the many good qualities of sweet peas, and I feel that it would have been well-nigh impossible to have entrusted the subject to a greater admirer of these lovely flowers.

The position I am justified in claiming for the sweet pea is a fairly important one, as during four months of the year I place it well ahead of all other garden flowers except the rose. Speaking as one of the army of floral caterers for our great capital, it is safe for me to say that they form the very backbone of our supply from the time the good forced blooms arrive until the rose season is well advanced. The reason that they are so popular and useful is not difficult to determine, as it lies in three most important particulars. First, they give us an almost perfect range of superb and unaggressive colours; secondly, they are almost the easiest flower in the whole Flora to arrange; and last, but not least, they are not only beautiful when arranged alone, but carefully chosen shades blend with, and add beauty to, almost every other flower, from the choicest orchid to the commonest flower in the herbaceous border.

With a view to illustrating this, I give below a few of many contrasts which have suggested themselves to me, and I have often successfully used.

Clara Curtis is charming in a bowl with Sunset, Sunrise, or Marquise de Sinety rose, or in a table decoration of cattleyas and a few sprays of yellow and brown oncidiums, or in a bouquet of Carnation Mikado, which by itself is rather dull, but which becomes a lovely thing when mixed with this beautiful pea. It also contrasts splendidly with violets.

Evelyn Hemus or Mrs. C. W. Breadmore with Rose Mme. Abel Chatenay or Carnation Fortuna.

Mrs. Hardcastle Sykes or Princess Victoria with Carnations Mayday or Winsor, or Rose Prince de Bulgarie or President Carnot.

Asta Ohn, Frank Dolby, or Lavender George Herbert with yellow carnations or roses, or with cattleyas and Scabiosa caucasica.

Countess Spencer or Paradise with Rose La France or Bridesmaid.

Mrs. Henry Bell, Mrs. Hugh Dickson, or Zarina with Rose Lyon, Lady Pirrie, or Mrs. Alfred Tate.

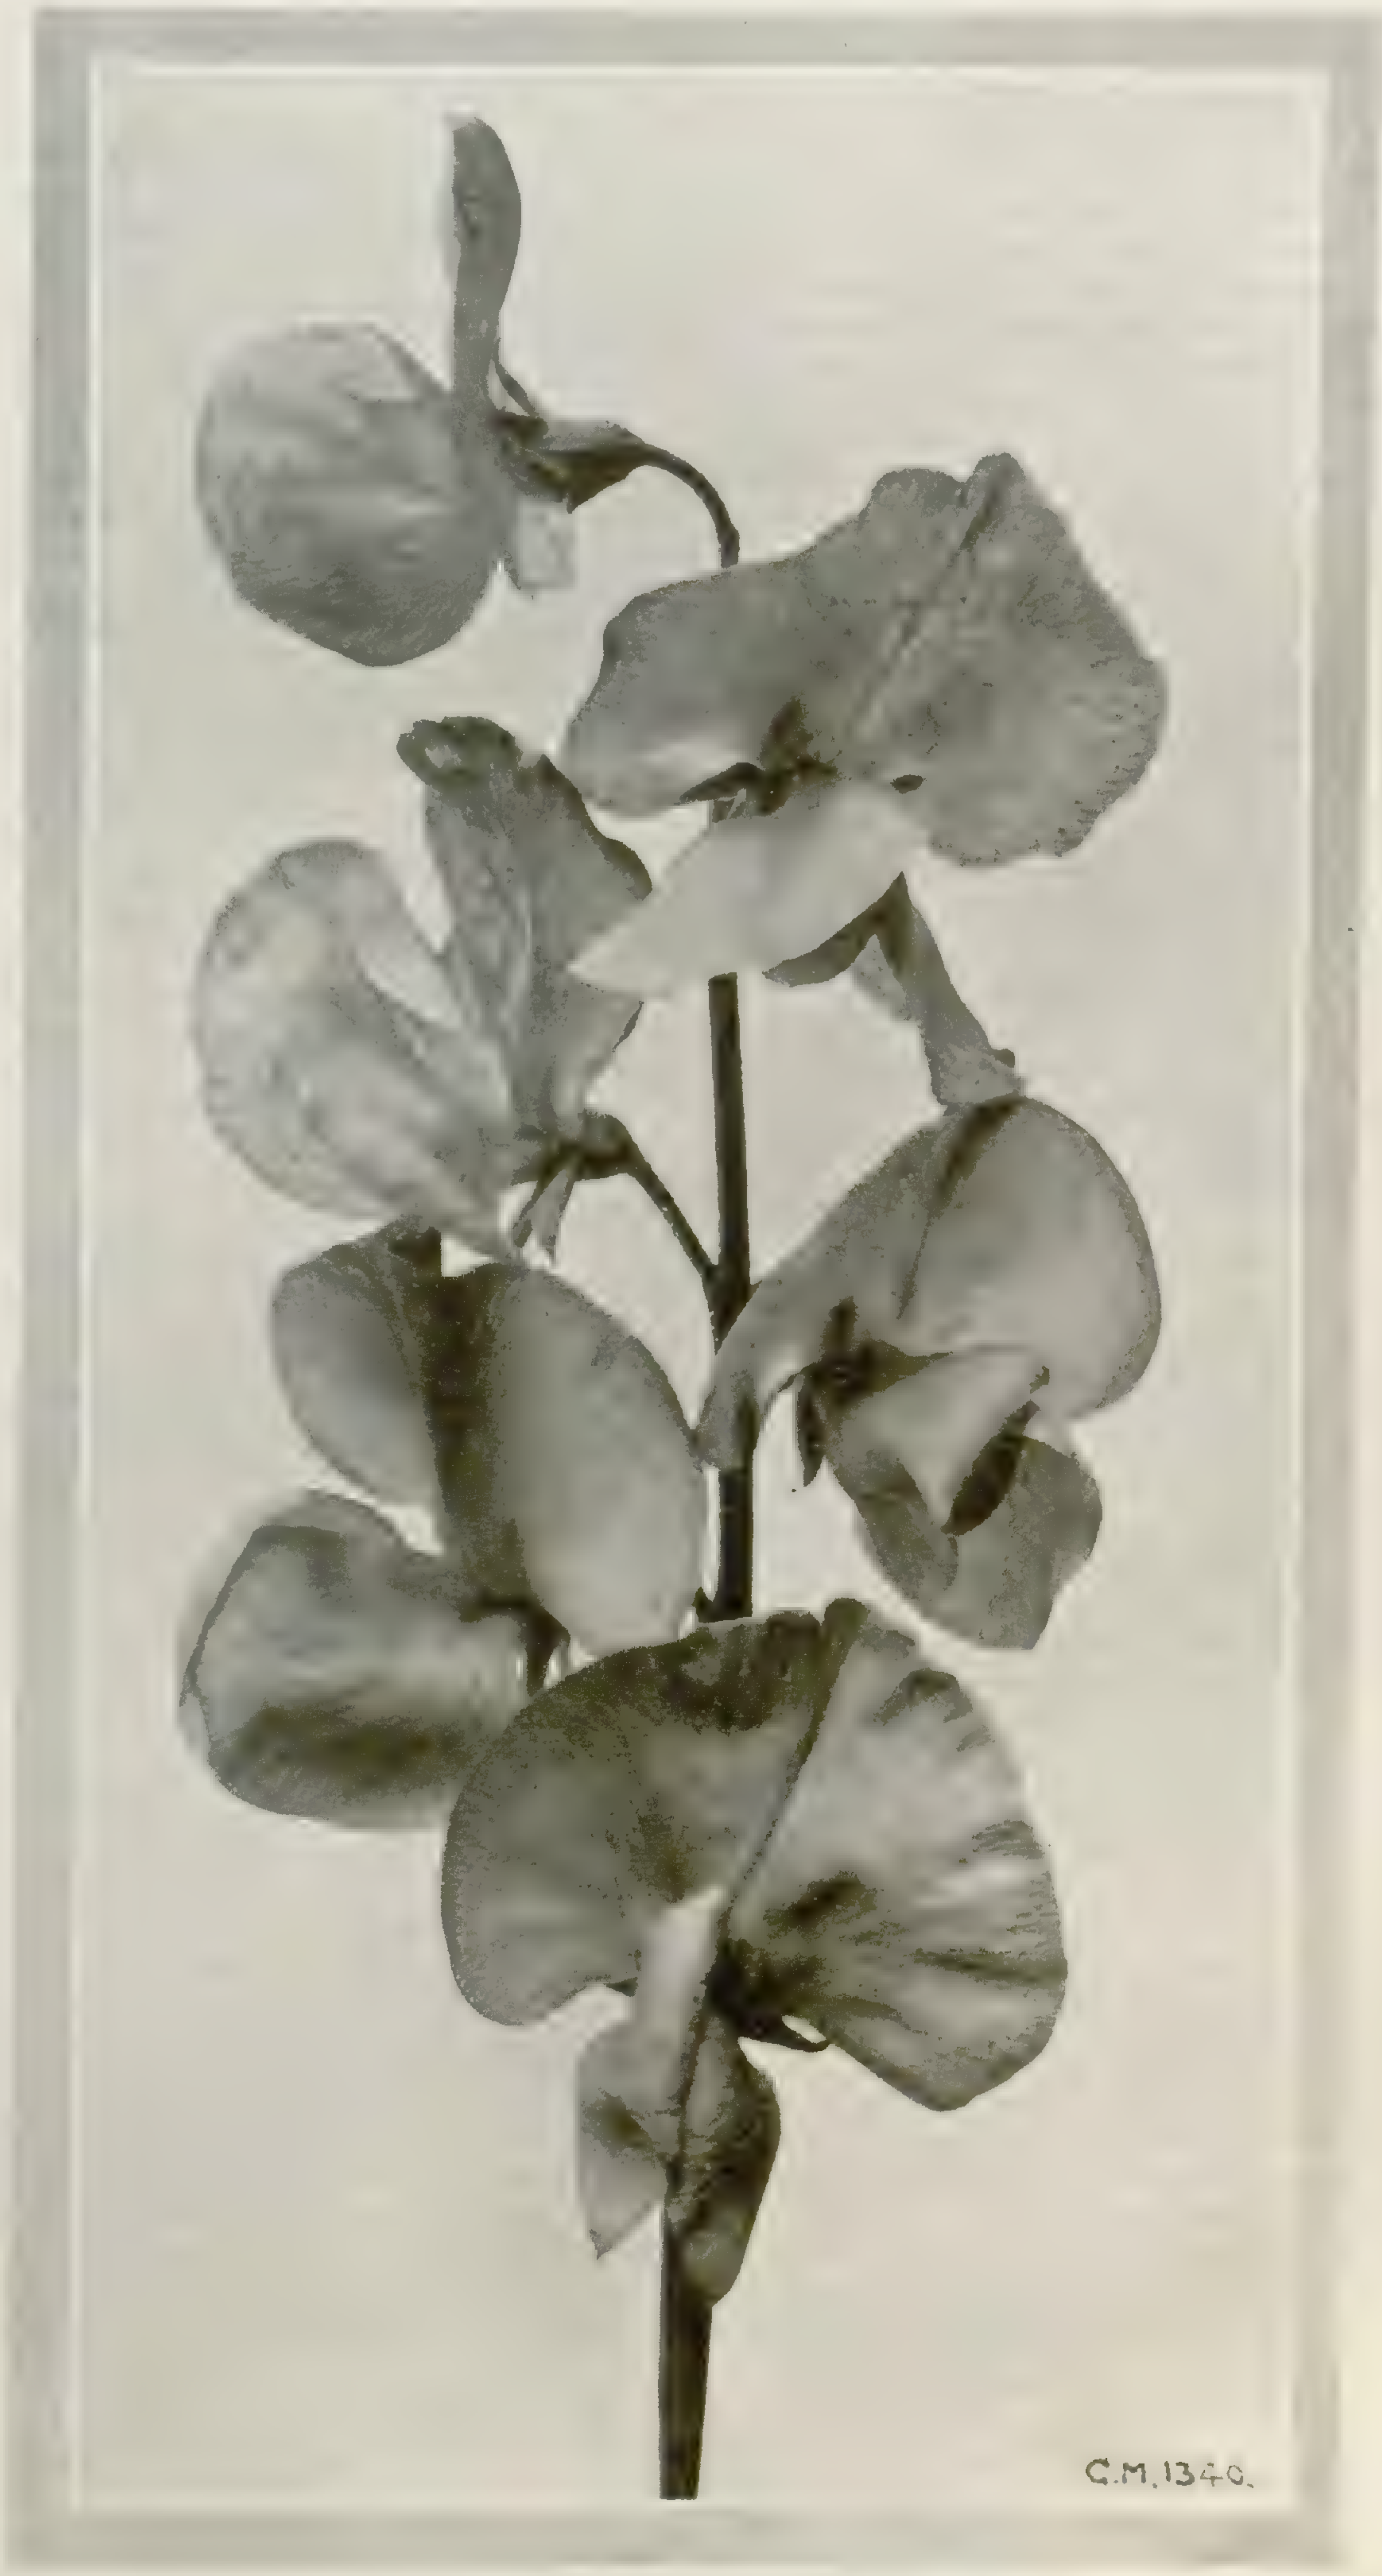
Etta Dyke, Nora Unwin, or Dorothy Eckford help to lighten any floral arrangement in which they are used, and in concluding the list, I should like to suggest Charles Foster with the lovely new rose Juliet. I have never tried them, but I feel certain they will produce a wonderfully effective contrast, and I am longing to use them.

Going from the house to the garden, sweet peas still hold their own from a decorative point of view, as there is nothing so graceful or productive, and nothing so easy to grow.

At every summer show, too, they play a most prominent part, and I venture to say create a more universal interest than any other flower, and they invariably give the brightest bit of decorative colour in the exhibition. If any proof of their value from a florist's point were needed, a visit to the National Sweet Pea Society's Show would more than provide it.

The tables and decorative vases of sweet peas are far more beautiful than those in similar classes at any other of our national shows, except those at the Rose Show, and they are lighter and more elegant even than them, their all-round excellence being far superior. This, I consider, is chiefly due to the fact that they are so much easier to arrange than roses.

As sweet pea foliage is not very suitable for table decoration, I advise the use of the following for that work: Selaginella cæsia, pale green Asparagus plumosus, pale A. Sprengeri, Gypsophila elegans or paniculata, Lonicera japonica variegata, or very light and slender sprays of Rochford's Golden smilax. Never use maidenhair fern, as it makes the arrangement heavy and stiff, as each frond is practically the same shape.



SWEET PEA STIRLING STENT.
Raised by Mr. J. Agate, and in 1910 was awarded by the National Sweet Pea Society a First Class Certificate and Silver Medal. The colour is brilliant orange.

I should like to take this opportunity of impressing upon all growers for market the stern necessity of growing none but the best varieties. I am sorry to say that, although there are quite a good number of really fine standard sorts which can now be bought fairly cheaply, there are, unhappily, many hundreds of boxes of cut flowers of the old hooded varieties daily put upon our market. These flowers do not make enough money to pay for picking and boxing, and it is remarkable that growers should continue their cultivation.

This wretched stuff does a great deal of harm to the sweet pea industry, as it gluts the market, and tires buyers who have to look over stacks of boxes to find a good one. Let me assure growers that a good quality in sweet peas is highly appreciated by the British public.

I now venture to give a list of a few of the very best varieties for decorations: Mrs. Hardcastle Sykes, Etta Dyke, or Nora Unwin, Helen Lewis, Mrs. Henry Bell, Evelyn Hemus (not too many) Paradise (if good stock), Frank Dolby, Mrs. Hugh Dickson, Zarina, Clara Curtis (not in very large quantities), Asta Ohn, Lavender George Herbert, Constance Oliver, Countess Spencer (good stock), Rosie Adams (small quantity), Sunproof Crimson, Masterpiece, Mrs. Andrew Ireland (in small quantities), Mrs. Townshend, and Winsome. May I also suggest a few newer varieties, and some not yet in commerce, which will be welcome additions when they become plentiful: Charles Foster, Stirling Stent, Dazzler, Lancashire, Cherry Ripe, Anglian Pink, Guy Hemus, Iris, and a giant cattleya-coloured one which has been named after me. Neither maroon, magenta, bronze, dark blue, or striped varieties should have much consideration by market growers. A short row of each will be quite enough just to give variety.

It will clearly be seen from the above list that I go only for the Spencer or waved type of flowers, although good stocks of some of the best hooded ones, such as Miss Willmott, Jeannie Gordon, Dorothy Eckford, and Queen Alexandra may also be grown with profit if they are really well done. My last word to all florists is never be afraid of using sweet peas because they are common, as, if properly handled, there is no more beautiful flower.

R. F. Felton.

SWEET PEA CULTIVATION.

The following is the text of the paper on "Sweet Pea Cultivation" read by Mr. George Herbert, at the Conference held by the National Sweet Pea Society:

In the present paper I give what has been my own experience in sweet pea culture, more especially for exhibition purposes. I always consider the secret of success lies in the preparation of the ground. No matter how excellent the variety, or how clever the feeding, if the ground is not well prepared one cannot reasonably expect good exhibition blooms, at least not such as are required to win prizes at the best exhibitions. I have found a fairly heavy soil suits sweet peas best, as they continue flowering for a much longer period, and produce finer blooms, as a rule, than if grown on a light soil.

The whole of the ground intended for sweet peas should be trenched to a depth of 2½ feet to 3 feet, and this should be done as early in the autumn as possible, to allow the soil to settle down during the winter. When trenching, have the two top spits turned from one trench to the other, and the subsoil, whether clay or sand, dug a foot deep, adding to it plenty of good rotten manure, leaves, and bonemeal. If there is a clay subsoil give it a good dressing of lime and ashes previous to turning the two top spits from the next trench on to it. I do not believe in putting in a thick layer of manure, then a layer of soil, and so on, but I do believe in thoroughly mixing the whole of the soil and manure together. This allows the sweet peas abundant and good food from the beginning to the end of their career. Many people put manure a foot thick at the bottom of a trench, and none anywhere near the top, and the consequence is that all the time the plants should be making rapid progress they are at a standstill, and by the end of the season they have just found the manure, and are doing their best when the frost comes.

Trenching should be finished before the New Year if possible, as this allows the soil a good three months to settle down before planting time, and, in my opinion, nothing is so detrimental to sweet peas as loose soil. I always aim at making the soil quite firm, and as the trenching proceeds we slightly tread down each bottom layer as it is put back (provided it is not too wet). The top is left as rough as possible to allow the weather to do its work. Early in the spring, before planting, a thin layer of short manure is spread on the ground and a light dressing of lime and soot over the top, and the whole is forked in; directly the soil is dry enough it is trodden firmly, and it is then ready for planting.

I consider the autumn is by far the best time for sowing sweet peas for all purposes. About the middle of October is a very good date. I prefer to sow in very shallow boxes, let the seeds germinate steadily in a cold frame, and when the seedlings are about three inches high pot them up singly in three-inch pots, using a good loamy soil and potting firmly. They are then transferred to a cold frame, and plunged to the rim of the pot in ashes, and here they remain until they are planted out in their flowering quarters in April. White, lavender, and cream varieties I always sow in very sandy soil; in fact, my best results in the germination of white sweet peas have been from pure sand. The seeds are apt to rot if kept too damp, owing to their very thin skin.

After potting, the seedlings should be kept moderately dry, because from December to February they grow very little. Air should be admitted to the frame freely, and if the weather is open the lights should be taken off altogether; this keeps the plants sturdy and strong. To coddle sweet peas means to ruin them.

The first week in April is a good time to start planting, weather permitting. If the plants have been kept cool through the spring they will suffer no injury whatever from any frost we may have after that date. For exhibition purposes I prefer rows to clumps, and allow at least 18 inches from plant to plant for all the strong-growing varieties. All are planted in double rows, but the individual plants are not placed opposite one another. Twelve inches is allowed between the double row. This allows the air to circulate between the plants as they are growing, and keeps them from becoming sappy through overcrowding. Plant firmly and place small twigs round each plant at once.

A great deal has been written as to the best way of staking sweet peas, and I have tried various methods, but the system adopted last season pleased me most, and certainly was the most satisfactory. Two poles about 12 feet high were put in at the end of each double row of 25 yards' length, and two more halfway between; a thin galvanised wire was then strained from pole to pole on the top another in the centre, and one about 12 inches from the ground. Long hazel sticks were then inserted in the ground outside the wires, on either side of the row, and tied back to the wires, this keeping them in an upright position, and leaving a clear air space of 12 inches down the centre of each double row of plants.

When the plants are growing well three of the strongest shoots on each should be retained and all lateral growths removed; this applies to the stronger-growing varieties, such as Elsie Herbert, John Ingman, etc. Nancy Perkin and Earl Epencer will do better with two stems, or even one stem. If the more vigorous varieties do not have more than one stem, coarse blooms often result, and these badly placed on the stem. The lateral growths should always be removed when young, simply rubbing them out with thumb and finger. This early disbudding saves a great deal of time, besides allowing all the strength of the plant to go to the haulm which has to produce the exhibition blooms. The growths should be trained on the outside of the sticks, and this can easily be managed by an occasional tie.

It is advisable to examine the sweet peas every day, for when about three feet high the plants rapidly increase in strength, and the tops get heavy, so that if there should be a rough wind or a heavy shower, and the tendrils do not happen to be in reach of a stick to cling to, the growths snap off or become so twisted as to spoil them. At this stage of growth, if the weather is warm, an occasional damping over in the evening is a great help to sweet peas. About the middle of June, if the weather is at all dry, give a heavy mulch of long manure on each side of the row. This keeps the ground cool and moist. The Dutch hoe should be worked freely about the rows during the growing season, as this is a great help, more especially if the weather is dry.

With regard to feeding, very little artificial manure is needed if the ground has been well prepared. On light soils more feeding will be needed than on heavy ones. I am a strong believer in soot as a manure, and this is worked round the plants with the Dutch hoe before being watered in. Mackereth's sweet pea manure I have also used with success, more especially in connection with pot culture, but, as I have already said, I depend chiefly on what is put into the ground before planting, and artificials I look upon as stimulants to be used if needed, but they often do more harm than good. I saw an example of this last season at one of our largest shows; there were flower stems considerably over 2 feet in length, but the flowers would have looked a deal better on six-inch stems. I asked the exhibitor how he obtained such long stems, and the answer was "Nitrate of soda." I had guessed as much, for although the flowers had not travelled half the distance others in the show had they were too soft and flimsy to open properly after being put in water; in fact, after the first day scarcely anything but the stem was to be seen. I do not condemn patent manures, but say emphatically they must be used very carefully, and in conjunction with natural manures—and hard work.

Having made experiments with feeding both on heavy and light soils, I have found better results follow on heavy land with very little feeding than on light soil with heavy feeding, the ground being well prepared in each case.

If late flowers are wanted from the same plants it is a good plan to cut them back alternately to one of the strong lateral growths that keep showing at the bottom of the haulm. This should be done about six weeks before the blooms are needed, and by keeping the early buds picked out as they appear the laterals will soon gain strength enough to produce really good blooms.

Sweet peas should be cut freely, and not a single seed pod should be allowed to form so long as flowers are needed for exhibition purposes. This advice has been quite unnecessary during the last two seasons, for it has been a trouble to get seeds to set at all.

A few sweet peas benefit by a slight shading, and I thing this is a point where some growers make a mistake. They endeavour to be extra careful, and put tiffany over all the plants, but what improves one variety spoils another. All the sunproof crimson set, lavender, bronze, and cream varieties, are improved by the sun, and lose their brilliancy or purity of colour if shaded. Such varieties as Nancy Perkin, Earl Spencer, Stirling Stent, and Dazzler are improved if shaded for about three days before they are wanted for show. After the flowers are cut the shading should be removed at once, as it soon causes the plants to become drawn if left in position.

A selection of varieties is best left to the discretion or taste of the grower; if he is a keen sweet pea man he will certainly be a member of the N.S.P.S. (if not it is quite time he was), and being a member, he will be furnished with all the information he desires regarding varieties, and so can make his own choice. Further, if he wishes to see the best and the newer sweet peas growing, he can, by taking a trip to the society's trials at Sutton Green, Guildford, see the cream of varieties, and so can make his own choice.

SPECIAL OFFER **SWEET PEAS** FOR 1911.

IF YOU WANT

REALLY GOOD SWEET PEAS

AT MODERATE PRICES, send to

ROBERT SYDENHAM, LIMITED, 33, TENBY STREET, BIRMINGHAM.

NO ONE WILL SERVE YOU BETTER.

This Firm has the largest Retail Sweet Pea Trade and Retail Bulb Trade in the United Kingdom. The quality of their SEEDS and BULBS is well known all over the WORLD as being equal to anything in the Market.

SPECIAL COLLECTIONS FOR 1911.

The seeds in these collections are all carefully hand picked; only plump, round seeds sent; all small or doubtful ones are taken out, which we do not think is done by any other firm; eighty to ninety per cent. guaranteed to germinate if treated as instructions sent with each collection.

⁂EACH PACKET in Nos. 1 and 2 CONTAINS 50 SELECTED SEEDS. Buyers not wanting any collection complete, may select their own varieties from EITHER COLLECTION at prices mentioned, and have any 3/- worth for 2/6.

COLLECTION No. 1.—12 Useful Grandiflora Varieties, 1/3.

Agnes Johnston, buff pink; **Dainty**, white with light pink edge; **Duke of Westminster**, rosy violet; **Hon. Mrs. Kenyon**, pale primrose; **Janet Scott**, pale pink; **King Edward VII.**, rich crimson; **Lord Nelson**, dark blue; **Phenomenal**, white, with blue picotee edge; **Prince of Wales**, rich deep rose; **Queen of Spain**, salmon pink; **Romolo Piazzani**, medium blue; **Triumph**, rosy salmon and blush bicolor.

COLLECTION No. 2.—12 Best Grandiflora Varieties, 1/9.

Black Knight, rich dark bronzy chocolate; **Dorothy Eckford**, best white self; **Helen Pierce**, pretty marbled blue; **James Grieve**, good pale primrose; **Jeannie Gordon**, carmine and buff bicolor; **Lady Grisel Hamilton**, pale lavender; **Mid Blue** (*syn.* **Zoe**), rich blue; **Miss Willmott**, best salmon red; **Mrs. Walter Wright**, rich rosy mauve; **Prima Donna**, pale blush pink; **Queen Alexandra**, the best crimson scarlet; **Saint George**, rich orange scarlet bicolor.

Single Packets of any variety in Collections Nos. 1 and 2, 2d. each.

COLLECTIONS Nos. 1 and 2 WHEN BOUGHT TOGETHER WILL BE 2/6. And 25 seeds each of the four best striped varieties will be added free of charge, viz.:- **Jessie Cuthbertson, Mrs. J. Chamberlain, Prince Olaf, and Unique.**

COLLECTION No. 3.—12 Good Waved Varieties, 2/-.

SPECIAL NOTICE.—The price of, and number of seeds of each variety in Collections 3 and 4 vary. The number is stated in figures after each name.

America Spencer (30), bright rosy-scarlet flake, **3d.**; **Apple Blossom Spencer (30)**, rosy pink and blush, **4d.**; **Black Knight Spencer (30)**, rich dark maroon, **3d.**; **Chrissie Unwin (30)**, cerise scarlet, **3d.**; **Elsie Herbert (30)**, white, with picotee edge of pink, **4d.**; **Flora Norton Spencer (30)**, pale blue, **3d.**; **Frank Dolby (50)**, lavender, **3d.**; **Gladys Unwin (50)**, pink, **3d.**; **Marjorie Willis (30)**, carmine rose, **4d.**; **Mrs. C. W. Breadmore (30)**, primrose, with picotee edge of pink, **4d.**; **Nora Unwin (50)**, white, **3d.**; **Paradise Ivory (40)**, pale primrose, slightly tinged with pink, **3d.**

COLLECTION No. 4.—12 Best Waved Varieties, 3/-.

Clara Curtis (50), primrose, **3d.**; **Constance Oliver (25)**, creamy buff, flushed deep pink, **6d.**; **Countess Spencer (50)**, large pink, **3d.**; **Etta Dyke (50)**, finest white, **3d.**; **Evelyn Hemus (40)**, primrose, with picotee edge of pink, **4d.**; **Helen Lewis (50)**, orange and rose, **4d.**; **John Ingman (50)**, grown from a true stock, carmine and rose, **4d.**; **Mrs. A. Ireland (30)**, rose and blush bicolor, **4d.**; **Mrs. Charles Foster (30)**, grown from a perfectly true stock, or **Asta Ohn (30)**, best lavenders, **4d.**; **Mrs. Henry Bell** or **Mrs. Routzahn Spencer (30)**, pale pink on cream, **4d.**; **Mrs. Hardcastle Sykes (30)**, blush pink, **3d.**; **Tennant Spencer** or **The Marquis (30)**, large rosy mauves, **4d.**

COLLECTIONS Nos. 3 and 4 MAY BE HAD TOGETHER FOR 4/6, and 100 seeds of the choicest **Spencer Seedlings** free of charge.

COLLECTIONS Nos. 2 and 4 MAY BE HAD TOGETHER FOR 4/6, and 100 seeds of the choicest **Spencer Seedlings** free of charge.

SPECIAL PRICE FOR THE FOUR COLLECTIONS, 6/6,

Which, with the added varieties, will be the best collection ever offered for the money.

NEW VARIETIES.

These novelties we believe to be fairly true, but they are sold without any guarantees.

Thomas Stevenson, orange scarlet, waved (**10** seeds), **1/-**, the gem for colour **(stock limited)**; **Maud Holmes**, the best of the [illegible] crimsons; or **King Edward Spencers**, waved (**25** seeds), **1/-** (**10** seeds) **6d.**; **Helen Grosvenor**, a glorified **Helen Lewis** (**10** seeds), **1/-**; **Amethyst**, the only lilac, waved (**10** seeds), **6d.**; Burpee's **Ethel Roosevelt**, bright rose flake on cream ground, waved, **10** seeds), **6d.**; Burpee's **Florence Nightingale**, lavender Spencer (**10** seeds), **6d.**; **Romani Rauni**, pale pink on cream, waved (**10** seeds), **1/-**; **Seashell**, cream pink, waved, **stock very limited** (**6** seeds), **6d.**; Unwin's **Doris Burt**, a grand bright [illegible], shaded, flushed cerise, waved, highly recommended (**12** seeds), **6d.**; Burpee's **Rose du Barri**, unique and distinct, a charming flower of deep rose, shot or overlaid with terracotta, Grandiflora type, very effective under artificial light (**20** seeds), **6d.**; **Zarina**, pale [illegible] pink, waved (**20** seeds), **4d.**; **Ruby**, an improved St. George (**10** seeds), **6d.**; **Miriam Beaver**, when true very like **Syeira Lee**, one of the most beautiful Sweet Peas yet raised (**10** seeds), **1/-**.

SPECIAL PRICE for this Collection of New Varieties. 7/-.

THE BEST TOMATOES, 3d. per packet of 200 Seeds. **THE BEST CUCUMBERS, 6d.** per packet of 10 Seeds.

THE BEST ONIONS—Excelsior or Ailsa Craig, 6d. per packet of about 1,200 Seeds.

BEET, 8d.; **BRUSSELS SPROUTS, 6d.**; **CABBAGE, 6d.**; **BROCCOLI, 1/-** to **1s. 4d.**; **CARROT** (Cleaned Seed), **6d.**; **PARSNIP, 2d.**; **TURNIP, 3d.**; **LYON LEEK, 1s.**; **LETTUCE, 6d.** to **8d.**; all per ounce.

All Flower and Vegetable Seeds (Peas and Beans excepted) carriage free. *Please compare these Prices with what you are paying.*

ALL OTHER SEEDS EQUALLY CHEAP AND GOOD. FULL LIST POST FREE ON APPLICATION.

DEAL'S CHOICE SWEET PEAS.

For Garden, Home and Exhibition.

COLLEEN—The brightest and best waved bicolor, fragrant and beautiful: Should be in every garden. A.M., R.H.S. and Wolverhampton ... ... 12 seeds **6d.**

SCARLET MONARCH—The brightest and best waved sunproof Scarlet. Brighter than Queen Alexandra; distinct from Sunproof Crimson, Doris Burt, &c. ... ... 12 seeds **2/6**

BERTRAND DEAL—The brightest and best giant rosy lilac; grand exhibition flower, unequalled for size and colouring in this class ... ... 12 seeds **2/6**

EMPRESS—The brightest and best giant rosy purple, far superior to Marquis and Tennant Spencer in size and rich colouring ... ... 12 seeds **2/6**

GIANT CREAM WAVED—The brightest and best cream waved; for depth of colouring and waviness beats all comers ... ... 12 seeds **6d.**

WINSOME—The brightest and best helio pink Spencer. A lovely flower both in form and shade ... ... 10 seeds **6d.**

ORANGE AND SCARLET SWEET PEAS.

Though probably giving the most striking colours among sweet peas, the orange and scarlet varieties have been, from a cultivator's point of view, the most disappointing, owing to their tendency to burn or scald if cultivated in full sunlight. But this failing has not deterred raisers from doing their best, not only to secure finely-formed flowers in these two sections, but also to secure varieties which will stand the sun, and it says much for their perseverance that they have so far succeeded, inasmuch as we now have varieties in each section which will compare favourably both for size, form, and sunproof qualities with most of those of other colours.

The orange varieties might well be divided into two sections, one consisting of those whose progenitors were probably the old varieties Gorgeous or Evelyn Byatt, both in their day marvels of colour, and I very much doubt whether we have any variety now that will give us such a striking bit of colour as would a bunch of the first-named. Following these two the next one of any real note was St. George, a variety that has failed to keep up its reputation owing to its great tendency to produce tendrils at the expense of flowers; but it has added its quota of colour, size, and waviness to its descendants, and though I have no authority to that effect, it seems quite probable that the three outstanding varieties of the present day are the results of cross-fertilisation with St. George. The three varieties I have in my mind are Edna Unwin, Dazzler, and Thomas Stevenson.

The former is a very fine flower; the standard is a little small, and apt to fall back, after the style of Etta Dyke, but it has real good substance, and the colour is nearly an orange self, with perhaps a suspicion of rose in it during dull weather. It is a very hardy variety, a persistent bloomer, and one which stands the sun fairly well. Dazzler is rather a better-formed flower, with a large standard, but it just lacks that bit of quality in which the former excels, the veinings in the standard showing through the colour, and this at times makes the standard appear thin. Thomas Stevenson is rather a larger flower than either of the preceding, and in the bunch is certainly the best. I have seen it described as like Helen Lewis, but this is not so, the standard being quite different, much plainer, and with more substance, while for an orange shade it stands the sun well.

The other class of orange varieties is the one of which Helen Lewis was the forerunner, and even now, when at its best, this takes a deal of beating. Maggie Stark is certainly a little deeper in colour, but otherwise the exact counterpart of the first-named. Helen Grosvenor, raised by Mr. Aldersly, struck me at the N.S.P.S. trials as being a little in advance of the two preceding varieties, not in colour, but certainly a trifle larger. Edrom Beauty is very close to these, but just a wee bit softer in colour, and I think this is destined to become a very popular decorative sweet pea. There are still several others of this type on the market, but I think those mentioned are quite the best of the orange and rose section. Orange King, raised by Messrs. Bide and Sons, Farnham, has a plain standard, but I have no hesitation in saying that this is the most brilliant of all orange sweet peas, and were it larger and more sunproof it would create no little sensation in the sweet pea world.

Coming to the scarlet varieties the improvement in this colour up to the last two years has not been so marked as in the orange set, but here again perseverance has its reward, and I think the season of 1911 will be marked by the advent of one or two scarlets quite fit to put on the exhibition table—and this has hardly been the case since Queen Alexandra was considered of good exhibition size. The latter Eckfordian variety and Scarlet Gem were grand in colour, and were very telling in collections of the grandiflora type, but not large enough to include with the more up-to-date Spencer type of flower. Undoubtedly the best break in this colour, after Queen Alexandra, was George Stark, and, as seen at Reading, it was indeed a wonderful variety, but, unfortunately, it has not been seen so good since, though at Sutton Green this past summer there were several varieties on trial, including this, which were more or less alike, both in habit of growth and in colour of bloom. The brightest of them all was one from Mr. W. Deal, under the name of Scarlet Monarch, George Stark Improved and Red Star being also very noticeable. Another variety which is very good is Mr. Unwin's Doris Burt: this is not quite such a vivid scarlet, but has, I think, a little more substance in the flower.

SWEET PEA MAORI BELLE.
Raised by Mr. Trevethick. Colour, pale lavender.

Neither of these scarlet varieties should require much shading to show them at their best, but it is certainly advisable to plant them in a position where they receive a little shade in the middle of the day, or if an exceptionally hot spell is experienced a double thickness of fish netting will give all the shading that is required. With the orange varieties it is imperative that some provision be made to shade them before a show, but I would advise that this should not be overdone; three or four days' shading should suffice for the most readily "burned" varieties, and the very thinnest tiffany procurable should be used, keeping it well away from the blooms, so that a good current of air is able to pass beneath it, or the flowers will lose colour from want of air.

Though advising shading as a preventive of scalding or burning, in many districts it may not be necessary, but each one may easily tell by close observation how much sun the flowers will stand, and if the shading can be dispensed with so much the better. Good bunches of any of the varieties mentioned above are so very effective that they amply repay any little extra trouble that is incurred to secure them in the best possible condition.

T. A. S.

Pot Figs may be top-dressed and started at once if required early. See that the roots have a thorough soaking, especially if the plants have been kept indoors. Then sponge the wood with some insecticide, remove the top soil, and mulch with some rich material which has been prepared previously. A good forcing pit is an ideal place to start pot figs in; begin with a temperature of 50 degrees syringing the plants daily.—W. A. C.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

IN THE WARM DIVISION of the orchid houses work will be now confined principally to sponging and cleaning the plants. Vandas, aerides, saccolabiums, and allied genera should be carefully examined for scale and other insect pests that may secrete themselves in the axils of the leaves, and more particularly on the lower sides of the leaves and stems of the plants. A soft, pointed stick is the best means of dislodging them; rubbing with a brush is liable to scratch and disfigure the foliage of the plants. It is scarcely safe to recommend the use of insecticides for sponging purposes as they are dangerous unless one is perfectly familiar with their constituents. While cleaning the plants see that those which have become loose in the pots are secured to fresh sticks, so that they may be held in position and receive no damage when moved about while the glass, etc., is being cleaned.

AMONG CATTLEYAS AND LÆLIAS cleaning should also be proceeded with, and it is surprising how quickly scale increases immediately the plants show signs of renewed vitality. To save considerable work at a later period it is advisable to have a general clean-up, and thoroughly examine every plant. When cleaning the cattleyas and allied genera, particular care is necessary to avoid damage being done, not only to the leading growths of the plants, but also to the dormant buds we commonly term eyes, at the base of the pseudo-bulbs. The careless operator bruises and destroys any prospect of such buds ever breaking into growth. The inside glass should be cleaned as well as the pots, staging, etc., and a rearrangement of the plants will probably be found beneficial to all.

WATERING.—In all the warm houses careful watering is necessary. No hard and fast lines can be laid down for general application, as the conditions are so widely different where orchids are grown. In addition to the surroundings in which the plants are grown, the weather and outside temperature must have due consideration, with reference both to watering and damping down. These matters can only be determined by the enthusiastic cultivator, but I would point out once again that no greater considerations are necessary in the successful cultivation of orchids than are so extensively practised in the cultivation of other stove and warm house plants.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE.—The earliest plants of this valuable winter-flowering begonia and its varieties, having completed their flowering period, may be given a few weeks' rest prior to starting them into growth for an early supply of cuttings. This may be brought about by a gradual reduction of moisture to their roots and a moderate lowering of the temperature. The minimum, however, should not be less than 55 degrees. Where the leaves are in a healthy condition insert a number, proportionate to requirements, singly in small pots filled with a sandy compost. The leaves should have about an inch of stem attached to them. Until root action has commenced moisture should not be allowed to reach the leaves, but a small amount of air must be regularly admitted to the propagating case.

GLOXINIAS.—An early display of gloxinias is useful, and sure to be appreciated during the early springtime. Select the earliest ripened corms for this purpose, and allow them to remain in their old pots, which, however, ought to be examined with a view to putting the drainage in order. Remove the loose soil from the surface, and replace with a compost consisting of good loam, peat, and dried sheep manure. As soon as the pots are well filled with roots apply regularly applications of diluted farmyard manure, with an occasional top-dressing of fine bone-meal or other suitable fertiliser.

ALOCASIAS. — These ornamental-leaved plants are always admired in collections of stove plants. A. Sanderi requires, when at rest, somewhat different treatment to the rest. It must not be severely dried off, but given cooler conditions during the shortest days of the year. Alocasias may be repotted ready for starting into growth later in the season. The compost should consist of mellow, good fibrous peat, loam, and sphagnum, in equal parts, with a little silver sand and a few clean broken crocks, lumpy charcoal, etc.

CROTONS.—Every endeavour should be made to thoroughly cleanse crotons before starting them into growth next month. Unsightly specimens that may have lost their lower leaves and have good tops remaining should be notched and mossed up for the increase of stock. These must be kept constantly moist to encourage root action. The larger branches may have pots tied around the stems that have been cut half through. As each pot is firmly secured to the stems it should be filled up with potting compost, consisting of loam, peat, and silver sand.—John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—Plants that were put out in the beds last autumn will greatly benefit by having the surface soil slightly stirred with the hoe during mild weather, providing the soil is in a fairly dry condition. In proceeding with this operation each plant should be examined, and if found to be loose it must be made firm again. In many localities it is found necessary to pot up the layers, winter them in cold frames, and plant them out in the early spring. Where this practice is carried out the ground selected for them should be prepared without delay, leaving it in a rough state until required for planting. For heavy soils a good dressing of wood ashes or burnt garden refuse is recommended, or old hotbed material if ashes are not procurable. We always add a good quantity of sea sand to the soil with excellent results, the salt in the sand being an excellent stimulant for them. Plants in frames will require an occasional examination, and if any disease is apparent they should be dusted with flowers of sulphur, which usually checks it; water must be carefully given.

LILY OF THE VALLEY.—A good top-dressing of leaf-soil should be given the beds without delay. Where necessary to lift the roots, owing to their being much crowded, the replanting should be done as early as possible. If fresh beds can be made so much the better, adding plenty of leaf-soil when the ground is dug. When planting is completed spread a layer of decayed leaves over the beds.

VIOLETS.—All decaying foliage, weeds, etc., must be removed from plants growing in frames. In many gardens it is a difficult matter to obtain a good supply of flowers, especially at this season, and it is necessary to take every precaution against damping. Remove all side runners, as if left they will weaken the plants. A dressing of some approved fertiliser should be given, and lightly worked in with a fork. A good watering should be given when the beds are dry. Plants growing outside should be cleaned and top-dressed.

BEDDING PELARGONIUMS.—A commencement may be made with the potting of these. If the soil in the cutting pots is dry well water it a few hours before commencing to repot. Old potting soil and spent mushroom bed material form a good mixture. Large 60's will be the most suitable; no crocks are necessary, merely a small quantity of loose manure or leaves over the drainage hole. When potted place the plants in a warm fruit house to induce fresh root growth.

SWEET PEAS.—The ground where it is intended to grow these should be prepared as early as possible. To obtain good results deep tillage is essential, and the soil should be either trenched or deeply dug, incorporating a good quantity of decayed manure with it, and, allowing the top to lie in a rough condition till required for planting or sowing.

LAWNS.—All bare places should be made good with fresh turf as soon as the weather permits it being laid. Frequent sweeping and rolling is necessary to keep the grass in good condition.—E. C. Pooley, Gnaton Park Gardens, Plymouth.

FRUITS UNDER GLASS.

STRAWBERRIES IN POTS. — Where these are wintered in frames a batch should now be prepared for forcing. Clear off dead leaves, small weeds, or mossy surface, and make sure that there are no worms in the pots. Wash the pots, and well ram the soil if it is loose. I prefer to top-dress when the roots begin to move and the flower stems are pushing up. Stand the pots on shelves in a vinery or peach house, or if a house or span pit can be afforded make a bed of leaves and plunge the pots in this for three weeks. The starting process must be a slow one, and 45 to 50 degrees will be ample to begin with. Royal Sovereign and Noble are still two good reliable varieties for early use.

POT VINES that were started at the end of November will now be breaking fast, and as soon as the shoots are a couple of inches long they may be tied up carefully, maintaining equal distances between the rods. Very little water will be required yet if the pots are plunged, but a sharp look-out is necessary, as once the roots become dry they are practically useless. Keep the temperature of the pit at 70 degrees in fair weather, but in cold weather 65 degrees will be ample, allowing a drop of 5 degrees at night.

VINERIES.—In the second vinery the vines should be pruned and dressed. Let the glass and woodwork be subjected to a thoroughly good scrubbing and washing, as so much depends upon a good clean start. In the successional vineries and muscat houses, if the grapes can be cleared, it would be well to prune the vines now, because this will lessen the tendency of bleeding. On no account permit fire heat at this season. Dress the vines as circumstances permit.

FIG HOUSE.—The fig trees must now be pruned, cleaned, and trained. Remove from the base some of the old wood, and take up some new branches. This should be done each year, but in large and old-established trees it is not so much a question of pruning as it is thinning and regulating the branches, as these trees make sturdy, short-jointed wood, required especially for early forcing. Tie the shoots straight, so that the tree looks smart and workmanlike, and cut the tie ends short. The fig tree does suffer from many ailments, but if any mealy bug and spider has been present the branches should have had a good cleaning previous to tying. Dress the walls with hot lime and sulphur, and fill up all crevices in which insects may lurk.

MELONS.—To raise melons to produce fruit ripening in May seeds should now be sown; prepare some good soil, maiden loam for preference, and mix in a little sand and leaf-soil and a small quantity of spent mushroom bed manure. Pass all through a half-inch sieve. Put one seed in each small pot and press the soil moderately firm. A few extra seeds should be sown at this season, so that the strongest plants may be selected. Raise sufficient plants to allow one for every fifteen inches run of the house. For very early melons the cordon system is the best. Place the pots in a warm corner, with a bottom heat of 80 degrees, and as soon as the plants have made one rough leaf carefully give them a small shift without damaging the roots; again make the soil quite firm, and stand the plants near the glass, where they will have the full benefit of the light, in order to produce dwarf and sturdy plants. We grow Scarlet Seedling, Blenheim Orange, and Hero of Lockinge.—W. A. Cook, Leonardslee Gardens, Horsham.

THE MOST USEFUL SWEET PEAS.

No flower has risen to such high popularity within recent years as the sweet pea. A few years ago it was the custom to mix the seed and to sow it very thickly in rows in spring, often in some out-of-the-way part of the garden, and the result was we were able to gather quantities of indifferent short-stemmed flowers for about a month or six weeks, and after that the row would be covered with seed-pods. The plants were generally pulled up because of their unsightly appearance in the middle of the summer. To many of us sweet peas scarcely appeared to pay for the time and trouble of staking, and no gardener dreamed of trusting to them for making the prominent parts of the garden beautiful during the whole summer.

Yet the change has been so complete that no annual is now held in such high favour. And a garden to-day is considered behind the times unless it has its collection of up-to-date sweet peas. And rightly so, for I maintain there is no plant in existence which will give such an abundance of bloom over so long a period as the sweet pea. The popularity of the flower I attribute to several reasons. The ever-growing demand for cut flowers for the decoration of the home first created a desire to make use of them, as their fragrance and elegance are delightful. Our seedsmen, with ever a keen eye to business, knew the drawbacks; they saw also a great future if the obstacles could be overcome, so they set to work, and lists of new varieties began to appear, and new colours were created. The public, ever on the look-out for new things, purchased them readily. So we advanced each year, from the hooded standard to the plain, and on to the waved Countess Spencer. Yet this was only the beginning of good things to come, and I remember saying at the time, "Oh, if we could only have all the other beautiful colours in waved flowers like Countess Spencer." Now we have them and many other lovely colours added, but I think we are as eager as ever to obtain any novelty that appears.

With the advent of new varieties we found less seed in the packets, and it therefore needed more care, otherwise some busy mouse would eat half the seed of a new variety in a night, and the prowling slug would finish the rest by eating off all the young shoots as soon as they were an inch or two high. Since necessity is the mother of invention, we resorted to the system of sowing the seed in pots and transplanting them to the open ground in spring, naturally sowing each variety in separate pots and planting them separately. Our next desire was to improve the quality of the flowers. We therefore cultivated better, and some of us resorted to what I consider the secret of all success, "deep trenching."

I would like to give my mode of culture as practised at Shotesham Park with sweet peas for nearly ten years. I find the sweet pea plant needs much longer to mature than we used to give it. I therefore sow seeds in pots in the autumn, and find the most suitable times are the first two weeks in October. The novelties often cannot be obtained until well into the new year, and my advice is to sow directly they arrive. I choose 4in. pots, placing five or six seeds in each. The pots must be clean, otherwise the ball of soil will not turn out properly at the time of planting without greatly damaging the roots; place one large piece of crock in the bottom for drainage. The soil should consist of best fibrous loam, with a good sprinkling of coarse sand; on no consideration use leaf-mould. The soil should be fairly moist (not sticky) at the time of sowing. The seeds should be covered with ¼in. of the soil. I find the lavender varieties, which have very poor-looking seeds, often rot if sown deep, and these we scarcely cover at all. The pots are placed close to the glass on a vinery shelf in a house where the grapes have been cut, and the fire not used. If the pots are watered a few days after sowing, no more water will be needed until the seeds have germinated. When the plants are about one inch high we remove them to a cold frame, placing them on an ashbed close to the glass, and removing the lights always, except when it is raining, freezing, or snowing. There is no plant which resents coddling more than the sweet pea, and our aim is to produce a short sturdy plant.

The preparation of the quarters where the plants are to bloom should have been carried out in the winter. The ground should have been trenched to a depth of 3ft. to 4ft., and plenty of farmyard manure worked in all the way from the bottom to the top of the trench as the work proceeds. I am also a great advocate of soot; this I have sown thickly on the top after the trenching is done, and forked in as deeply as possible. Basic slag is used in the same way. There are two ways of growing sweet peas—clumps and rows. I practice both. We have a path 400 yards long, and on each side, 2ft. back from the box edging, the clumps of peas are planted 4ft. apart and paired across the path. If the colours are well chosen this makes a delightfully interesting walk, and one great advantage is, the flowers can be examined by the ladies in almost any weather. Some may suggest that sweet peas cannot be grown in the same position year after year, but here we have grown them in the same place for seven years, and in 1910 they were as good as ever; the clumps of one year are set midway between the sites occupied the previous year.

When all is ready, about the first week in April, and the soil works nicely, we shake the soil away from the plants and plant them singly 9in. apart in the clumps and about six plants in a clump, and as soon as this is done we stick them at once with twiggy bits of hazel about 18in. high, and put a 15in. label to each clump, with the name written clearly and in a large hand. When the sweet peas have grown to the height of the twigs, we stake them finally with hazel branches 12ft. high and make all tidy; we also dust frequently with soot to keep off slugs, and use black cotton if birds are troublesome. In the rows the planting should be done the same way, setting the plants alternately in double rows 2ft. apart. Very little then needs to be done except to see the leaders are not broken by being entangled in the sticks; the hoe is used frequently.

Someone may ask if all this labour is necessary if one does not exhibit and only grows for house decoration. We grow for both, and consider it equally as important to produce flowers of fine quality for house decoration as it is for exhibition. I am not concerned with exhibiting in this article, but in any case quality, with purity of colour, should count before coarseness, and a spike measuring 15 to 18in. in length, with four flowers on a stem, well set, is perfection for house and table decoration. If the directions given are followed flowers will begin to open the first week in June. One can then cut plentifully, with the splendid result that the more one cuts the more will come, and the better it is for the plants. It is not necessary to cut all the flowers as they open so long as none are allowed to form seed pods.

To give some idea of the length of time it is possible to cut flowers from one batch of plants, I may say I kept two large vases on my employer's writing table continually filled with sweet peas, about 30 spikes in a vase, from June 4, without a break until November 2, and even then the plants were covered with bloom, but the frost killed them. Clumps of sweet peas may be used to advantage at the back of herbaceous borders, or any borders or beds where height is required, with telling effect.

Which are the best varieties to grow for house and table decoration is a somewhat difficult question to decide. I find generally the softer shades of pink and orange are most appreciated. The flowers are best cut in the morning after the dew has disappeared, or in the evening when it is cool, and as soon as they are cut they should be placed in water. The flowers improve by being cut 12 hours before they are used. The spikes should be cut the full length, and placed from 12 to 20 spikes in a vase, using their own foliage, but not too much of it; about four leaves round the edge of the vase and about three shoots among the flowers, is sufficient, though gypsophila and light grasses may also be used with telling effect. Sweet peas are always much more effective if one variety is placed in each vase. What can be more lovely than vases filled with Earl Spencer, Evelyn Hemus, Maud Holmes, Mrs. Hardcastle Sykes, Zarina, Elsie Herbert, Etta Dyke, Masterpiece, Mrs. Andrew Ireland, Lady Grizel Hamilton, Syeira Lee, Countess Spencer, or Mrs. Routzahn. If mixed flowers are preferred great care must be used to blend the colours; few can imagine the delightful effect of a lightly-arranged table of Earl Spencer or Evelyn Hemus or Mrs. Hardcastle Sykes. Or if it is preferred to mix them, I should suggest Mrs. Henry Bell, Earl Spencer, and Clara Curtis, or Evelyn Hemus, Mrs. Hardcastle Sykes, and Syeira Lee. The flowers should be set out loosely, and crowding is an unpardonable fault.

Lewis Smith.

THE IVY SAXIFRAGE.

Those who wish a dainty little plant with polished leaves and tiny stars of gold, which look specially delightful in the shady parts of the garden, would do well to purchase a packet of seeds of Saxifraga cymbalaria, the Ivy Saxifrage, a charming annual, which sows itself so freely that once introduced it hardly ever deserts the place again. Indeed, it may sow itself rather too freely for some gardens, but it is such a shallow rooter that it can hardly do injury to anything else, and can be quickly weeded out when necessary. Its value to us is greatly increased by its fondness for a shady and rather damp place, where it will come up from year to year and brighten up a spot hardly ever gay save when this little plant is in bloom, which is for many months of the year. This little saxifrage has glossy, kidney-shaped leaves, and a number of small clear yellow flowers, which are borne for a long time in succession. When the flowers first appear the plant only rises a little above the earth, but the stems gradually lengthen, and form rather sprawly little stalks, with their blooms, yet never ungainly, or rising too much above the soil so as to be out of proportion.

It is an excellent plant for a shady, damp, retaining wall, with plenty of soil between the joints, and with taller plants among it. There it sows itself readily, and clothes the crevices with pretty leaves and bright little flowers from spring until autumn.

S. A.

THE WORK OF THE NATIONAL SWEET PEA SOCIETY.

Rule 2 of the National Sweet Pea Society reads: "That the objects of the society be to encourage the cultivation and improvement of the sweet pea, by exhibitions, trials, conferences, or any other way the committee shall determine." Word for word, this rule is precisely the same as the one made when the society came into being in 1901, and, though its full meaning was not appreciated by everyone in the earlier years of the society's history, successive committees have taken opportunity by the hand, and now all the specified "objects" have been realised.

We began with an exhibition at the old Royal Aquarium, on July 25 and 26, 1901, and that exhibition was notable for the advent of Countess Spencer, the first waved sweet pea, and for the terrific thunderstorm that broke over London on the first day. There were twenty classes for sweet peas and one for varieties of Lathyrus latifolius. All the prizes were provided by the society; there were no classes for specified varieties with prizes offered by interested traders; the classes ranged from thirty-six to two bunches, and "twenty sprays only shall form a bunch" was the original regulation in this matter. The cash turnover of the society in its first year was £95 3s. 4d.; £47 3s. were paid in prizes, and £79 4s. 6d. received as subscriptions. The balance carried forward was £10 6s. 5d., and the total number of members was 117.

During the year just ended the members numbered about 1,000, and the new members alone amounted to 166, while 109 societies were in affiliation. The society's cash turnover was £768 10s. 10d.; subscriptions amounted to £326 16s. 5d., while the cash prizes paid (apart from the value of cups, plate, and medals) amounted to £91. A balance of £126 18s. 9d. was brought forward, in addition to a deposit account of £100 that forms the nucleus of a reserve fund.

It was in 1905 that "The Sweet Pea Annual" was first issued; it was a paper-covered octavo booklet of 60 pages, advertisements included. But information beyond the class specifications was given in the schedule for 1903, and in that publication sweet peas were grouped in their colour classes. This classification was revised the following year, and appeared in the schedule of 1904. In this latter issue appeared also an "Audit of the Sweet Pea Show of 1903." In the spring of 1906 Mr. Horace J. Wright was compelled, for private reasons, to relinquish the secretaryship, a "position he had occupied from the inception of the society with so great advantage to the members and credit to himself." He was succeeded by the present writer.

Although the committee and judges have sat as a Floral Committee on exhibition days, from the first show, it was not until the annual meeting of 1906 that a definite Floral Committee was formed, consisting of Messrs. T. Jones, A. Malcolm, T. Stevenson, P. Waterer, J. Watson, J. M. Bridgford, S. B. Dicks, G. Herbert, A. Ireland, J. Jones, and T. A. Weston, with Mr. Horace J. Wright as chairman. A trial of sweet pea novelties was conducted at Reading by Mr. Charles Foster in 1906, and a large trial in 1907, which was inspected by the Floral Committee before that body proceeded to make awards. When Mr. H. J. Wright entered the seed trade he became ineligible, as a principal, for a seat on the Floral Committee, and Mr. W. P. Wright was elected as the chairman. Trials were conducted at Reading up to 1909, and at Guildford in 1910. "The Sweet Pea Annual of 1908," bound in stiff cloth covers, was a great success, and later issues have followed upon the plan and style then adopted.

The trials are conducted for the purpose of testing novelties by the side of standard varieties; for determining to which colour class the new varieties belong; for comparing varieties and bracketing those considered to be too-much-alike, thus in effect reducing the number of names; for the purpose of granting awards or certificates to varieties of high merit or distinction; and also for the determination of the purity of stocks. No other floral society conducts work of a similar character, and the work done has been eulogised by amateurs and traders in this and other lands. It is necessary work, and work that can only be done to the public satisfaction by a public body like the National Sweet Pea Society.

The foregoing is a brief outline of the work of the National Sweet Pea Society, but it does not include "The Outings," which have become such a popular feature, and are as useful educationally as they are socially. The first conference was held in 1909, and was so great a success that another was held in 1910, and it seems highly probable that a conference will in the future be as much a part of the society's programme as its exhibition and trials.

The National Sweet Pea Society has in a very large degree been the means of creating a great industry, and one has only to look at the leading seed catalogues of 1900 and of 1911 to discover how popular the flower is, and how keen the seedsmen are to obtain as large a share as possible of the immense business now done in sweet peas. Sweet pea specialists have risen in considerable numbers, and yet a dozen years ago we should have laughed at the idea of anyone conducting a business entirely in and wholly of sweet peas. The introduction of new varieties has been checked somewhat by the unkind seed seasons of 1909 and 1910, and also by the public and independent trials conducted by the society, and the work of the Floral Committee. It must always be remembered that the National Sweet Pea Society exists for the advancement of its name flower and not for the particular benefit of either the amateur or the trader. Without the traders we should fare badly in regard to novelties and purity of stocks. Without the amateurs the traders would do badly in regard to sales, because, although market growers need seeds in bulk, they stick to standard varieties, while the amateurs buy the finer stocks and the higher-priced novelties. Amateurs should, I think, exercise a little more patience in regard to novelties, remembering that the difficulties that have attended the fixation of waved sweet peas are being rapidly overcome. Traders might well give more consideration to the sweet pea trade as a whole, and be less anxious as individuals to "get rich quick." New names for varieties showing infinitesimal variation from well-known sorts, petty jealousies and suspicions can only have one end, i.e., disaster to the sweet pea trade as a whole, and consequently to those who are in it. It would appear as though there were a danger at present lest, in our keenness and enthusiasm, we all, amateurs and traders, become overheated, and so, impair the working of the National Sweet Pea Society and check the widespread advance of the sweet pea as a highly developed florist's flower.

Charles H. Curtis.

Adelaide Road, Brentford.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

Orchids provided the predominating feature of the exhibition held at the Royal Horticultural Hall, Westminster, on January 17. They were very beautiful, no fewer than a dozen groups being staged, in addition to small contributions of a few plants each. Fruits were also splendidly shown, the apples vying with the orchids in colouring and effectiveness.

FLORAL COMMITTEE.

Primulas were a great force in the rock garden exhibit made by Messrs. T. S. Ware, Ltd., Feltham, and with these were associated Cyclamen coum album, Lithospermum rosmarinifolium, hellebores, heaths, and saxifrages. Azaleas, oranges, and the berried Debregeasia velutina were largely shown by Mr. L. R. Russell, Richmond. Spiræas and liliums from retarded plants were grouped with fragrant daphnes, rhododendrons, hamamelis, etc., and edged with Iris reticulata, I. Krelagei, I. Dantordi, and the lovely I. histrioides major by Messrs. W. Cutbush and Son, Highgate. Carnations were also displayed in quantity by the Highgate firm, including the new Miss Winnie Hay, a yellow ground fancy, with scarlet markings.

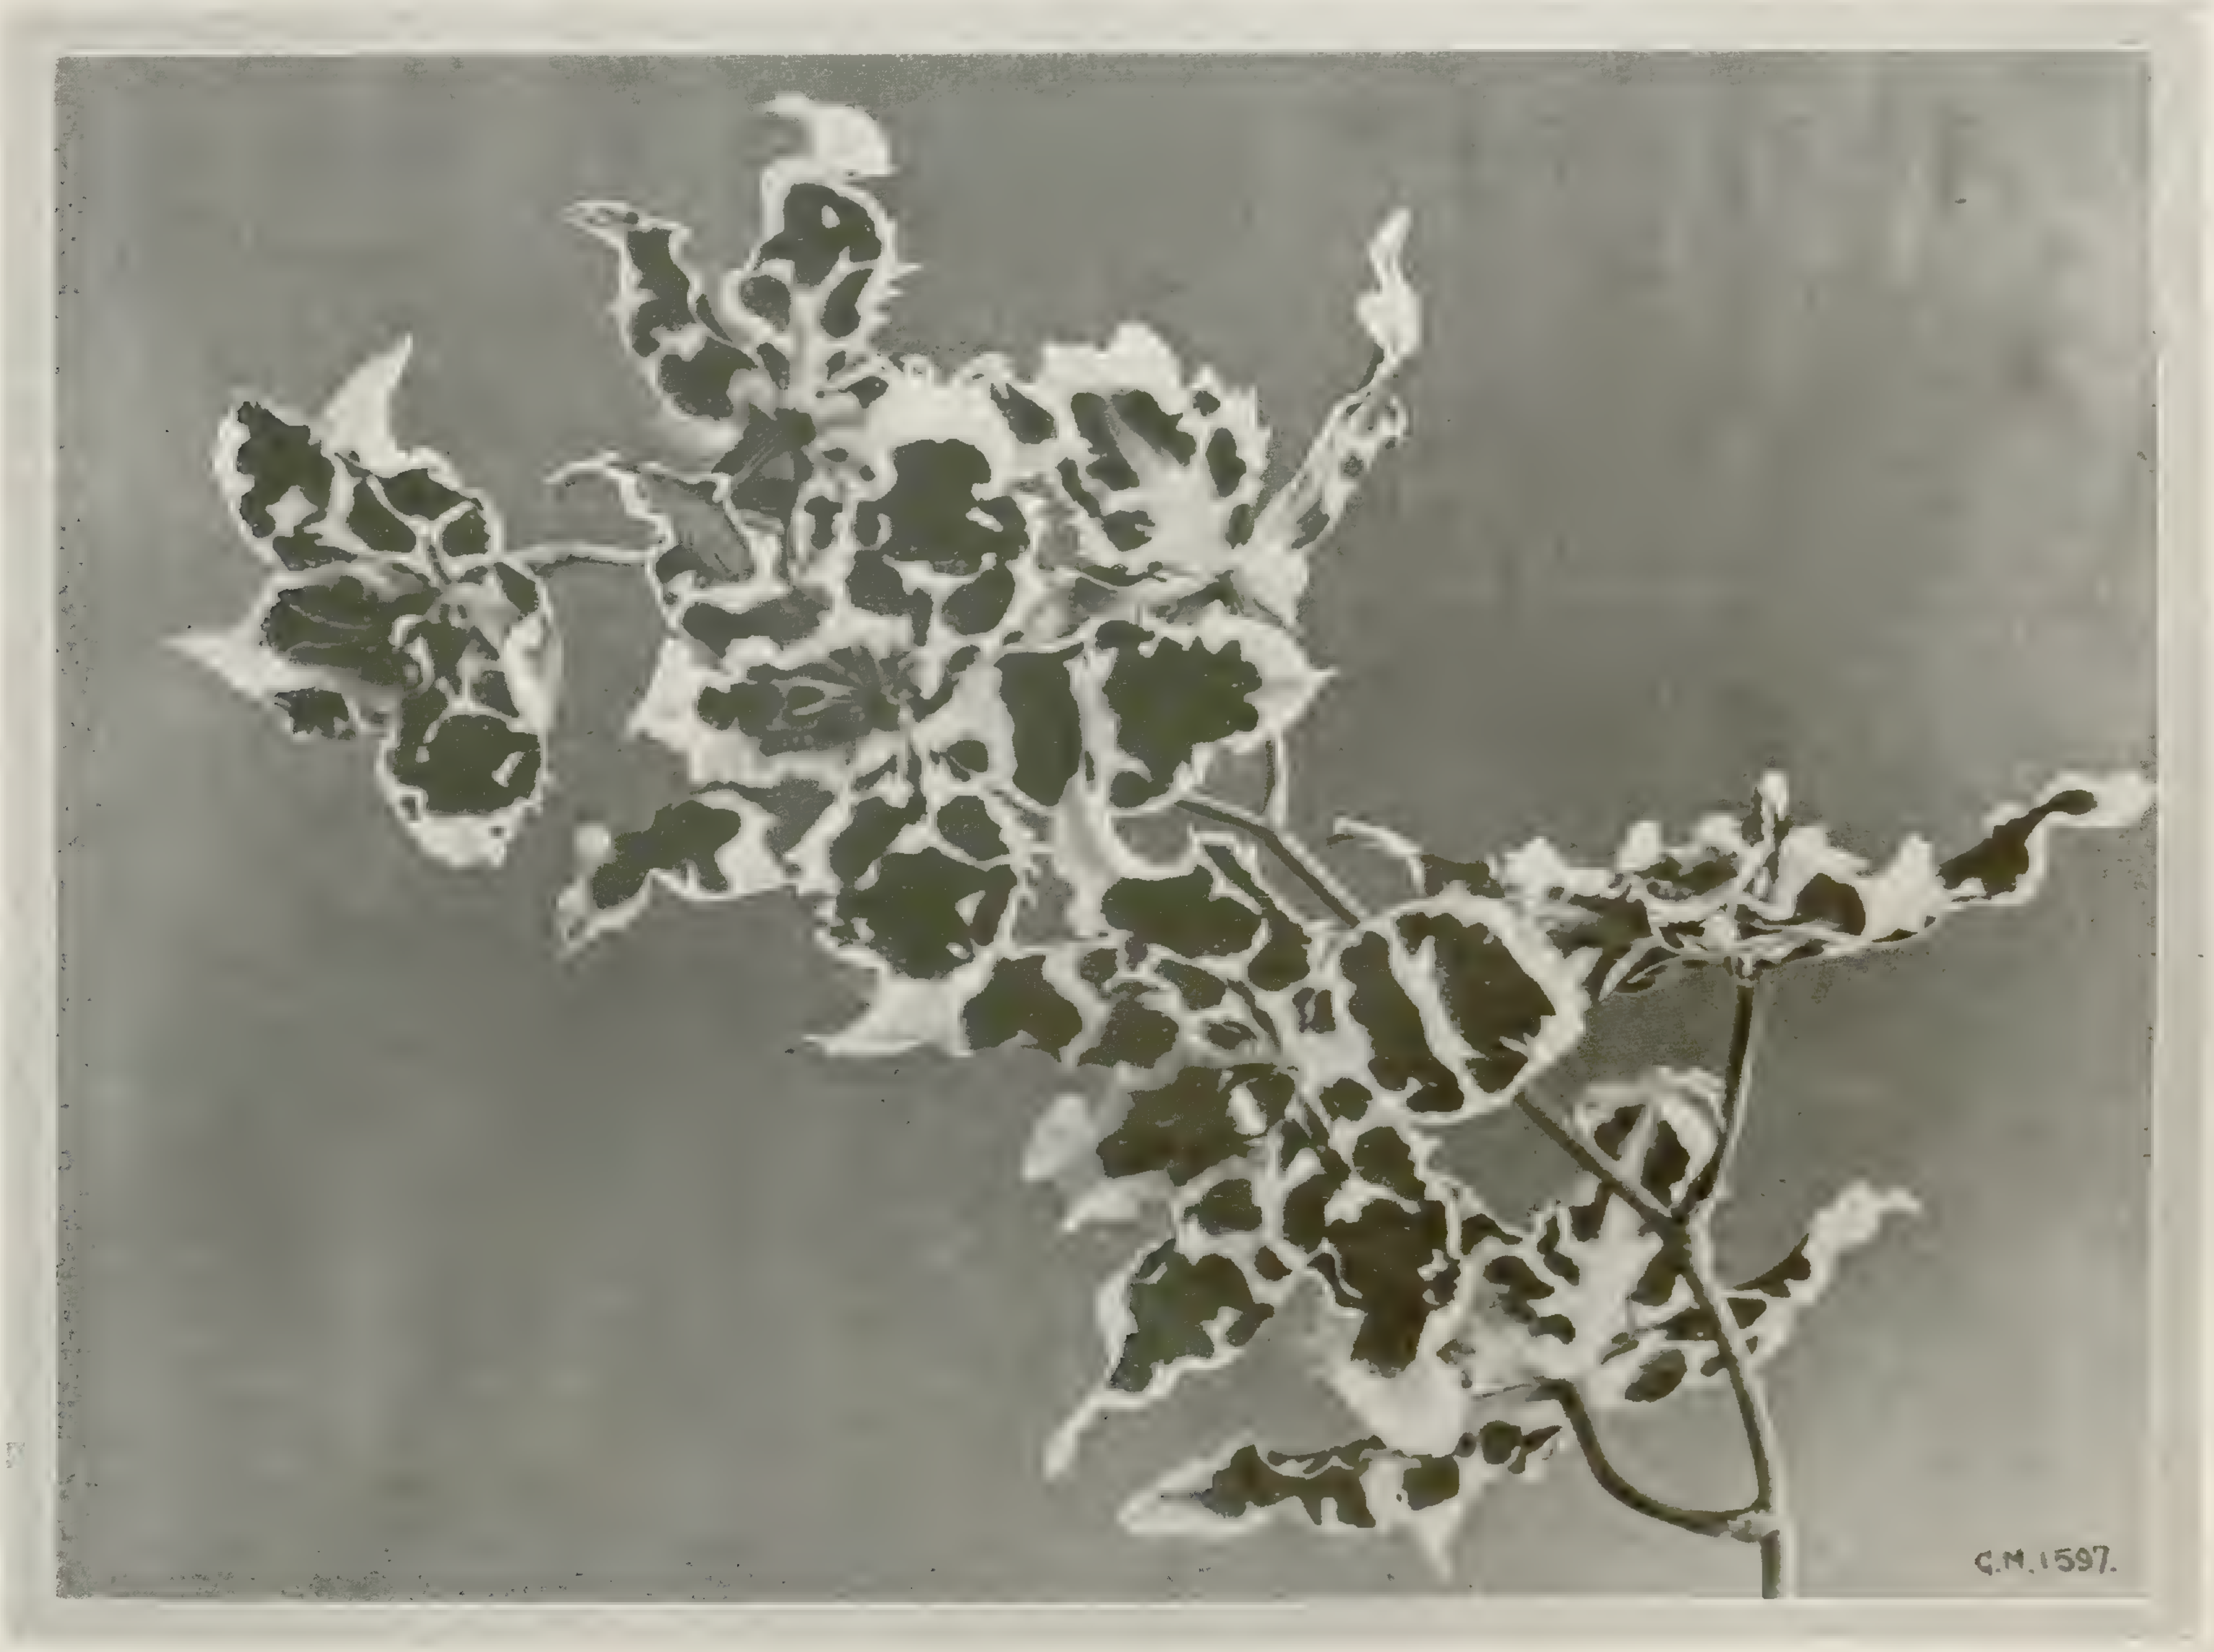
Messrs. Barr and Sons, Covent Garden, exhibited hybrid freesias, lachenalias, crocuses, snowdrops, primulas, and old Japanese trees, and made a very pretty display. Some beautiful carnations were brought over from Guernsey by Mr. H. Burnett, who presented grand examples of Mrs. H. Burnett, Fortuna, Marmion, Mrs. C. F. Raphael, White Enchantress, etc. Messrs. H. B. May and Sons, Edmonton, submitted a collection of ferns, nephrolepis and davallias figuring largely; D. tenuifolia Veitchi and Asplenium Nidus multilobatum were very fine. Mr. G. Reuthe, Keston, showed some charming crocuses, irises, hamamelis, and other interesting things. Shrubby veronicas, encrusted saxifrages and heaths were sent up by the Guildford Hardy Plant Co.

Indian azaleas made up a good part of the group from Messrs. Jas. Veitch and Sons, Chelsea; with these were Coleus thyrsoideus, Eupatorium vernale, Erlangea tomentosa, freesias, and camellias. The group of carnations from Messrs. Stuart Low and Co., Enfield, included good vases of Mrs. M. T. Crook, Baroness M. de Bremen (light pink, new), Fortuna, Royal Purple, Mrs. H. Burnett, Beacon, Regal Mauve, etc. Alpine plants, chiefly mossy and encrusted saxifrages, in pans and pots, with Cyclamen coum, C. ibericum, and Hamamelis arborea, were exhibited by Messrs. J. Peed and Sons, Norwood. A very pretty group of the elegant and useful Primula malacoides was set up by Messrs. S. Bide and Sons, Farnham. Some plants were in quite tiny pots, and others in 48 sizes, and all were producing spikes of rosy lilac flowers in great profusion. For the cool greenhouse this is a charming primula. Mr. Robinson, gardener to Lady Church, Woodside Place, showed a few cyclamen and a couple of flowering plants of Ruellia macrantha.

ORCHID COMMITTEE.

Of great interest was the group of home-raised hybrid orchids brought up by Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne. The odontoglossums included O. splendidissimum and O. percultum vars. The odontiodas were several forms of O. Bradshawæ and the cypripediums were C. Chapmani—three forms of it, C. Venus, C. Venus grandiflora, C. Regina Oakwood var., C. hirsuto-Leeanum, C. Kenneth, and in addition there was Cattleya Chapmanni (Hardyana and Trianæ), and C. armainvilliersense Oakwood var. Messrs. Jas. Cypher and Sons, Cheltenham, contributed some finely-grown cypripediums and a few calanthes. Among the former C. Wm. Lloyd, C. Mrs. W. Mostyn, C. Curtmanni punctatum, C. Charlesianum Cypher's var., the big C. Beekmani, and C. Actæus Langleyense were particularly good.

A superb exhibit, and one that entirely filled one long length of tabling, came from Messrs. Charlesworth and Co., Hywards Heath, and it was the most beautiful display in the hall. The whole of the centre was filled with odontoglossums and odontiodas, their many graceful spikes of varied hues attracting general attention and obtaining great admiration. Odontoglossum Phœbe, O. Edward, O. armainvilliersense, O. Lambeauianum, O. percultum, O. concinnum, O. Ernesti, O. Pescatorei, O. crispum, O. Circe, O. eximeum, etc. were grouped with Odontioda Bohnhofiæ, O. heatonensis, O. Bradshawiæ, O. Craveniana, O. Keighleyensis, and O. Cooksoniæ. On either side of these were groups composed of Lælio-cattleya Bella alba, L.-c. Lambeauianum, Cattleya Octave Doin, C. Empress Frederick, and C. Trianæ. At one end were beautiful spikes of Lælia anceps, a new oncidioda (Cochlioda Noetzliana and Oncidium leucochilum), calanthes, Lælio-cattleya Charlesworthi, Zygo-colax Charlesworthi, and Saccolabium bellinum. At the other end was a batch of the lovely Vanda Amesiana and Lycaste Skinneri. A few fine cypripediums, such as C. Helen II. Westonbirt var., C. Lawrebel, and C. Alcimeda (Alcibiades superbum and insigne Harefield Hall), a noble flower.



ODONTOGLOSSUM HALSEYANUM.

Flowers large, spotted with purple-brown. A.M., R.H.S., January 17. J. Gurney Fowler, Esq.

Messrs. Stuart Low and Co., Enfield, had a very pretty and interesting collection, wherein white varieties of Lælia anceps were conspicuous, with fine forms of Oncidium varicosum Rogersi. Some good cypripediums were presented, and of special interest were Sophro-cattleya Saxa Low's var., Odontioda Bradshawiæ, Odontoglossum crispum roseum, Cymbidium Wiganianum, and Lycaste Mrs. Rogerson. Mr. G. W. Miller, Clarkson's Nursery, Wisbech, contributed a group of calanthes, cypripediums, and Lælia anceps, but the pots were so much in evidence that the effect of the flowers was spoiled.

Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, showed Cypripedium Cupid magnificum (very pretty), C. Princess Louise, and Sophro-cattleya Mrs. Francis Wellesley. Another nice group was the one from Messrs J. and A. McBean, Cooksbridge, Sussex, and here Lælia anceps Stella, L. a. Schroderiana, L. a Sanderiana, and L. a. Distinction were beautiful. Cypripedium Euryades, C. Octave Doin, Cattleya Enid, with three big flowers, Odontoglossum Harryano-Halli, and Zygopetalum Perrenoudi were also very fine. From Sir Jeremiah Colman's collection at Gatton Park, Reigate, Mr. Collier brought up the small but graceful Masdevallia polystachys, Pleurothallis Scapha, Bulbophyllum Dayanum, B. auricomum, Zygopetalum Leopardinum Gatton Park var., and Cypripedium Helen II. Mr. de Barri Crawshay staged Odontoglossum Rosefieldiense (Harryanum and Lambeauianum), a handsome hybrid richly hued—a sort of glorified O. Lambeauianum (A.M.)

Mr. R. G. Thwaites, Chessington, Streatham, brought up a number of examples of Cattleya Octave Doin, and also showed C. Blacki and Odontioda Zephyr. Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, staged Odontioda Lutetia, with bright orange flowers, and O. Royal Scarlet (parentage unknown), with deep crimson scarlet flowers. In the interesting exhibit put up by Messrs. Mansell and Hatcher, Rawdon, Yorks, we noted Vanda Cathcarti, Cypripedium aureum Vine House var., and Vanda Amesiana. Messrs. Heath and Son, Cheltenham, presented a small collection of cool cypripediums.

Messrs. Sander and Sons, St. Albans, brought up the leading white varieties of Lælia anceps, Lælio-cattleya Colmaniana, L.-c. Goldfinch, L.-c. Epicasta, some grand varieties of Cattleya Trianæ, Odontoglossum Ophir, Cypripedium Alfred Statin (A.M.), Brasso-cattleya Thorntoni, Vanda Amesiana, and Cœlogyne pandurata. Mr. W. Carr, gardener to E. Roberts, Esq., Park Lodge, Eltham, had a few good cypripediums, in which C. Sir Redvers Buller was very prominent. Mr. Edward V. Low, Haywards Heath, presented Cypripedium Prospero, C. Ville de Paris, C. Madame Jules Hye, C. auriferum, C. Beckmanni, and other good things.

Mr. J. B. Lowe, gardener to Mrs. Geoffrey Lubbock, Broadoaks, West Byfleet, brought up a small group of dendrobiums, chiefly D. nobile varieties. Mons. Firmin Lambeau, Brussels, sent over a splendid cypripedium named C. Elizabethæ var. Volsang; it was of large size and fine colouring, the deep purple spots on the whitest dorsal sepal making a fine colour effect (F.C.C.). J. Gurney Fowler, Esq., Glebelands, South Woodford, brought forward Odontoglossum Halseyanum (A.M.), which had large flowers, being spotted with purple brown. From South Lodge, Horsham, Mr. Du Cane Godman sent Odontoglossum Godmanni (A.M.), a pretty crimson purple hybrid between O. Edwardi and O. Rolfeæ.

FRUIT AND VEGETABLE COMMITTEE.

Mr. W. Poupart, Twickenham, again showed finely bottled fruits. Mr. W. J. Grant, on behalf of the Monmouthshire Educational Committee, exhibited seventy varieties of potatoes grown in their trials. Eighteen sets were selected in each case, and grown, and attached to the samples of produce shown on this occasion was a card indicating the amount of ware and seed potatoes (by weight) produced, the amount of chats, and also of diseased tubers, and finally the total weight of crops lifted. The name of the society and the source of the seed were given in every instance, and below this information was given as to the flavour of the variety when cooked, and also the colour and the consistency of the potato when cooked. The information is now issued in printed tables, and doubtless can be obtained from the authorities. Such information cannot fail to be of great value to cottagers and allotment holders in the country.

Messrs. Sutton and Sons, Reading, showed some beautiful samples of their superb Early White and Winter Mammoth broccolis, all grown in the open in the Southern counties. Some splendid samples of apples were displayed by Messrs. W. Seabrook and Sons, Chelmsford, and especially attractive were Claygate Pearmain, Blenheim Pippin, Royal Jubilee, Bismarck, The Queen, Newtown Wonder, and Mère de Ménage.

Messrs. Jas. Veitch and Sons, Chelsea, staged a superb collection of brilliantly coloured apples. There were one hundred distinct varieties represented, and these included Northern Greening, Lord Derby, Bow Hill Pippin, Gascoigne's Scarlet, American Mother, King of Tompkins County, Dumelow's Seedling, Bismarck, Alfriston, Paroquet, Annie Elizabeth, Rival, Crown Apple, and King of the Pippins—all splendidly shown. Messrs. George Bunyard and Co., Maidstone, contributed a very fine collection of brightly-coloured apples and a few pears. The fruits were piled in pyramids on plates and baskets, and such varieties as Washington, Newton Wonder, King of Tompkins County, Twenty-ounce, Beauty of Stoke, Swedish Reinette, Baumann's Red Reinette, Mère de Ménage, Farmer's Seedling, and Lord Castlereagh, were immensely attractive.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Cypripedium Elizabethæ var. Volsang, from Mons. Firmin Lambeau, 42 Square Vergote, Brussels.

Award of Merit.—To Odontoglossum Halsevanum, from J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford; to O. Rosefieldiense, from De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks; to O. Godmanni, from F. Du Cane Godman, Esq., South Lodge, Horsham; and to Cypripedium Alfred Statin, from Messrs. Sander and Sons, St. Albans.

MEDALS.

Gold.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Jas. Veitch and Sons, Chelsea, for collection of apples.

Silver-Gilt Hogg.—To Messrs. George Bunyard and Co., Ltd., Maidstone, for fruit.

Silver-Gilt Flora.—To Messrs. Wm. Cutbush and Son, Highgate, for hardy flowers and carnations; to Messrs. Jas. Veitch and Sons, Chelsea, for flowering plants.

Silver-Gilt Banksian.—To Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne, for orchids; to Mr. H. Burnett, Guernsey, for carnations.

Silver Flora.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc., to Mr. L. R. Russell, Richmond, for azaleas, etc.

Silver Knightian.—To Messrs. W. Seabrook and Sons, Chelmsford, for apples; to Mr. W. J. Grant, Monmouth Education Committee, for potatoes.

Silver Banksian.—To Mr. G. W. Miller, Wisbech, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to E. Roberts, Esq., Eltham, for orchids; to Messrs. S. Low and Co. Enfield, for carnations; to Messrs. T. S. Ware, Ltd., Feltham, for alpines, etc.; to Messrs. Sutton and Sons, Reading, for broccoli.

The National Sweet Pea Society.

In accordance with an announcement made in our issue of the 14th inst., a special general meeting was held at the Hotel Windsor, Westminster, for the purpose of rescinding an instruction from the annual meeting to the General Committee, and passing a rule defining the status of an amateur. Mr. G. W. Leak, chairman of committee, presided, and there was a large attendance of members, many coming from distant parts of the country. Mr. C. H. Curtis having read a large number of letters from members who were unable to be present, relating to the questions at issue, the chairman formally moved that the instruction be rescinded, and Mr. W. P. Wright seconded.

Mr. Baker, of Wolverhampton, the author of the instruction, said he was in no way unfriendly to the committee, his only object being to have the status of an amateur as regards the Floral Committee properly defined. He therefore felt that the best course would be, as there were no rules with regard to the appointment of a Floral Committee, to rescind the instruction and request the committee to prepare a new set of rules, and submit them to a general meeting in April next. After some discussion it was decided that the better course would be to pass the original resolution, and then move the request as an amendment to the second resolution. On the resolution being submitted it was carried almost unanimously, only two voting against it. On the motion for adding the R.H.S. rule relating to amateurs to the rules of the National Sweet Pea Society being submitted, Mr. Baker proposed his amendment. After a rather long discussion, in which Mr. C. W. Breadmore, Mr. A. Dean, V.M.H., Mr. R. Sydenham, Mr. E. Molyneux, V.M.H., Mr. S. B. Dicks, Mr. E. F. Hawes, Mr. T. Stevenson, and other members took part, the amendment was carried with three dissentients.

A hearty vote of thanks was, on the motion of the Rev. Joseph Jacob, seconded by Mr. John Collingridge, accorded the chairman. With this the proceedings, which were of the most pleasant character throughout, terminated.

East Anglian Horticultural Society.

The twenty-first annual dinner of this club was held at the Criterion Restaurant, Norwich, on January 11, and was attended by the leading professional and amateur horticulturists of the district. After the loyal toasts had been duly honoured, Mr. J. E. T. Pollard gave "Success to the East Anglian Horticultural Society," and said he was pleased to see that the good work of the club had been well maintained. Its work had gone forward, its position had improved, whilst the finances were in a sound condition. The club had achieved a great success this year by winning the R.H.S. silver cup for fruit, and he thought such a success placed them well in the forefront of similar societies in the kingdom. The President (Mr. Lewis Smith) responded. He referred to the excellent series of lectures, essays, and exhibitions which had been held, and thought that such useful educational work must make itself felt in the career of all young gardeners who attended the meetings. Mr. J. F. Betts proposed, "Success to the Norfolk and Norwich Horticultural Society," and, in the course of his remarks, said he was pleased to learn that this society did not intend to drop its spring show this year. Mr. A. W. Preston responded, and took the opportunity of explaining that this year's Norwich Rose Show would be held in conjunction with the great show of the Royal Agricultural Society, which was holding its meeting this year at Norwich.

Mr. John Clayton, in some well-chosen remarks, gave "Success to the Royal Horticultural Society," to which Mr. Charles Daniels replied, and in so doing Mr. Daniels gave some interesting facts and figures of the great work of this body. Other toasts were, "The Special Prize Donors," proposed by Mr. H. Perry, and responded to by Messrs. E. W. Barnes, J. Forder, and C. Marr. Mr. J. Powley gave "The Norwich Museum Association," responded to by Mr. Edward Peake, its leader. Mr. F. J. Endersby gave "The Press," and extended the thanks of the club to the local and gardening Press for the notices of their meetings. Mr. E. W. Barnes gave "The Health of the Secretary," Mr. W. L. Wallis, which was received with musical honours.

Southampton Horticultural Society.

The annual meeting of the above society was held at the Shaftesbury Hall, Southampton, on Monday, January 9, the Mayor being in the chair.

The report presented by the council stated that the past season had been remarkable for the excellence and extent of the several shows, more especially the rose show and the autumn exhibition. Unfortunately, the attendance of the public at all the shows was disappointing, as a consequence the council is compelled, for the first time for some years, to carry forward a few liabilities to this year. In addition to the usual shows, a garden fête is to be held in 1911, as these have in the past been most successful. The council hope to show a better balance-sheet next year.

The number of subscribers has been well maintained, numbering now about 780, and the total amount subscribed to the several funds, £310 4s. The report records with regret the death of several of its vice-presidents, especially mentioning the late Mr. F. W. Flight, who had been a prominent exhibitor at the society's shows for more than thirty years. The report concludes with expressions of thanks to those patrons who have presented, and promised, cups, and helped the society in other ways.

The statement of accounts shows: Receipts. —From 1909, £24 14s. 11d.; rose show, £294 6s. 3d.; carnation show, £131 5s. 11d.; autumn show, £164 5s. 11d.; other items, £107 19s. 6d.—Total, £722 12s. 6d. Expenses. —1909 items, £2 14s.; rose show, £304 1[illegible] 9d.; carnation show, £130 15s. 10d.; autumn show, £154 16s. 5d.; general account, £10[illegible] 19s. 7d.; new stock, £7 5s. 6d.; cash balance, £20 10s.—Total, £722 12s. 6d. Assets.—Cash, including Cup Fund, £31 16s. Liabilities.—Autumn show accounts, £26 18s. 5d.; other items, £3 12s. 6d.—£30 10s. 11d. Credit balance, £1 5s. 1d.—£31 16s.

The election of officers resulted in the re-election of Lord Swaythling as president, Mr. E. Kemp Toogood chairman of the council, Mr. C. S. Fuidge as secretary, for the twenty-ninth time. All the other officers and retiring members of the council being re-elected, with one exception. The Secretary called attention to the fact that 1912 would be the jubilee of the society, and hoped the event would be celebrated by a special effort.

Bristol Gardeners' Association.

A largely-attended meeting of this association was held on January 12, at St. John's Parish Rooms. The chair was occupied by Mr. Hayball, and a paper on "Perpetual-flowering Carnations" was read by Mr. Wall, of Bath. The lecturer gave full cultural details, as practised so successfully by himself at Melrose Nursery. Cuttings, he said, may be taken during the first three months in the year. In the course of his experience he found the best rooting medium to be cocoanut-fibre and sand, and he placed the boxes over a moderate hotbed, keeping the overhead temperature ten degrees cooler, in order to retard growth until rooted. When potted singly, he placed them on a shelf near the glass, and pinched them when about six or eight inches high. Mr. Wall recommended a compost consisting of four parts loam, one part well-decayed manure, and one part sand and wood ashes, with a sprinkling of bonemeal, the latter to be left out at the final potting. Early in May he stands the plants outside on ashes, but keeps the weaker varieties under glass. The carnations are housed early in September, and given a temperature of about 55 deg., avoiding fluctuations. A useful discussion followed.

For three flowering plants Mr Jenn[illegible] was first, Mr. Springham second. In [illegible] point competition, Mr. Springham [illegible] six, and Mr. Woodward five points.

British Gardeners' Association.

On Saturday, January 21, a public meeting of gardeners in the Birmingham district will be held at the Cobden Café, Corporation Street, Birmingham, at 7.30 p.m. Mr. James Udale will preside, and addresses will be given by the chairman and secretary of the British Gardeners' Association, and other well-known gardeners. It may be stated that a cheap train will run at 2.55 p.m. from Burton-on-Trent to Birmingham, 1s. 9d. return, and tea will be provided, at 1s. each, at 6 p.m., for those coming from a distance.

National Hardy Plant Society.

A meeting of the Council was held at Birmingham on Thursday, January 12, Mr. A. J. Macself presiding. Business transacted included the election of Executive, Scientific, and Publications Committees, consideration of correspondence received from horticultural societies seeking the assistance and co-operation of the National Hardy Plant Society, and the laying of plans for the work of the coming season.

It was arranged that the society shall undertake to grant First Class Certificates and Certificates of Merit to new hardy plants of sufficient merit that may be exhibited at several of the leading shows, or that may be submitted to the Council during 1911. The society is now firmly established, and a goodly number of enthusiastic members are enrolled. Much useful work may be accomplished even during the first year of its existence, and it is sincerely hoped that all lovers of hardy perennial and alpine plants will join without delay, for it is on the number of members and extent of support immediately received that the amount of good work that can be done this year depends. The next meeting of Council will be held in London on Tuesday, February 28. The hon. secretary is Mr. F. Bouskell, Market Bosworth, Nuneaton.

THE NATIONAL SWEET PEA SOCIETY.

To the Editor of The Gardeners' Magazine.

Sir,—As the General Committee have been requested by the special general meeting of the members to formulate rules for the election and conduct of a Floral Committee, is it not a good opportunity to abandon the invidious distinction between "amateur" and "trader," and to elect the best men (and women, if desired) to that committee?

A Member.

FORTHCOMING ENGAGEMENTS.

SATURDAY, January 21.—Société Française d'Horticulture de Londres, Annual Dinner, 6.30 p.m.
British Gardeners' Association, Meeting at Cobden Café, Corporation Street, Birmingham, 7.30 p.m.
WEDNESDAY, January 25.—Irish Gardeners' Association meets.
FRIDAY, January 27.—Lee, Blackheath, and Lewisham Horticultural Society meets.
TUESDAY, January 31.—Committees meet at 12 o'clock; lecture at 3 p.m. on "Colour Photography," by Mr. Wm. Marshall.
THURSDAY, February 2.—Linnean Society.
SATURDAY, February 4.—French Horticultural Society of London.
MONDAY, February 6.—Dorchester Horticultural Society meets.
TUESDAY, February 7.—Scottish Horticultural Association meets.
THURSDAY, February 9.—National Horticultural Society of London, Exhibition in Paris.

International Horticultural Exhibition, 1912. — We are pleased to learn that this exhibition gathers increased patronage from week to week. As we have previously announced, King George V. and Queen Mary have consented to give their patronage to the exhibition, and now we have the satisfaction of announcing that Queen Alexandra, who has always taken an interest in British gardening, has become a patroness.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PRUNING IN FROSTY WEATHER.—B. M., Bridgnorth: There are two good reasons why pruning should not be done during periods of severe frost. One is that on trees of any size the work is a danger, as well as unpleasant to the operator; the other is that a great deal of damage may result owing to the snapping of twigs and branches when being pruned while frozen hard.

AMARYLLIS.—W. F. C., Hertford.—Now that the plants are fast developing their flower spikes give them just sufficient water to keep them growing steadily; after the dry soil has been once well moistened right through, not much more will be needed. Over-watering is a great mistake as amaryllis have few active roots at this period. After the flowers have faded, shake the old soil from the roots, trim away dead roots, and pot the bulbs in rich substantial loam that has been stacked for some time. Cow manure is a fine and useful addition. Plunge the pots in fibre, tan, or leaves, so as to secure a gentle bottom heat, and provide a moderate stove temperature above until the foliage approaches full develop-

Eckford's
Giant SWEET PEAS

SWEET PEA PERFECTION.

A flower garden without Eckford's Sweet Peas can only be compared to a house without furniture

Sweet Peas are requisite to the small, medium, or large garden, and if you wish to have colour, effect, prize specimens, and tall plants, then send to Eckford's for your seeds.

The time to buy is NOW. The firm to buy from is Eckford's. No other seed specialist in the world can rival Eckford's for Sweet Peas.

Larger flowers, longer stems, brighter colours, and a profusion of bloom is the result of growing Eckford's seeds.

Remember, Genuine Eckford's Seeds can only be obtained direct from Wem. No Agents are employed.

A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction.

SPECIAL NOVELTY OFFER FOR 1911.

LUMINOSA.—This variety will be appreciated for its deep coral colour, which for decoration is unexcelled, having the quality of giving off greater brilliance in artificial light than any other variety. Very scarce. In sealed packets, 7 seeds, **6d.**; 15, **1s.**

VICOMTE DE JANZE.—A fine bold flower of exquisite shape, the standard being splendidly erect; in colour it is deep bright rose, perfectly distinct; a charming flower. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

DODWELL F. BROWNE (WAVED).—This is a very beautiful intense bright crimson, three and four flowered, almost a self; a true Giant Waved variety of intense King Edward VII. colour. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SAINT GEORGE.—Light orange pink standard with slightly lighter wings; almost a self; good sizes; slightly waved. In sealed packets, 20 seeds, **3d.**; 40, **6d.**; 80, **1s.**

ASTA OHN (WAVED).—A pretty waved lavender overlaid with rose; a very charming flower of good size and substance. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MAGGIE GERRING.—This is a decided acquisition with a bold standard of perfect shape, and beautifully balanced wings. In colour it is a soft cream overlaid with a delightful shade of pink which rather deepens towards the edges. It is exquisitely rich in tone when bunched. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

APPLE BLOSSOM (WAVED).—This, as its name implies, is a beautiful flower of apple blossom colour, of giant size, and, like most of the waved varieties, is a very strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. E. GILMAN.—A fine bold flower, with expanded standard. It has a creamy ground suffused with bright rose, and almost pure cream wings. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

PICOTEE (WAVED).—This is one of the very finest introductions, being a giant waved flower, pure white, with a beautiful picotee edge of carmine; in most cases the flowers are borne in fours on a long, strong stem. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

EVELYN HEMUS (WAVED).—A warm cream, shading to yellow, with a picotee edge of terra-cotta pink; of great size and refinement; standard and wings beautifully waved, and nearly always four-flowered. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. HENRY BELL (WAVED).—A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MID BLUE.—A medium sized erect flower of deep sky blue. It is a strong grower, very free, and frequently four-flowered; quite distinct. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

OTHELLO (WAVED).—A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s**

CERISE (WAVED).—A fine, bold, beautifully waved, true cerise; a very strong grower, giving generally four flowers on long, strong stems. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SPECIAL OFFER. One full-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **12/6** post free for cash with order.
One half-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **6/6** post free for cash with order.

SPECIAL COLLECTIONS FOR 1911.

Villa (A) Collection. 50 very choice varieties, suitable for villa garden, excellent giant flowered sorts, most suitable for cutting and exhibition, 25 seeds of each, **10s.**

Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s. 6d.**

Half-Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 25 seeds of each, **3s.**, post free for cash.

FREE. Send a postcard to-day for large illustrated and coloured catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

HENRY ECKFORD, F.R.H.S. (Dept. 221), WEM, SHROPSHIRE.

ment, when more ventilation should be given, and, when growth is complete, cooler, brighter, and airier conditions should be afforded.

FAILURE WITH TULIPS.—S. J., Selby: No matter how skilful the cultivation, the bulbs would not have given good results. The dry bulbs, as well as those cultivated in pots, show that the stock was young and undeveloped, and in no case could we find any trace of a flower within a bulb. Cheap goods are by no means always the best; indeed, they are rarely so, and in matters of this kind, where it is so difficult to prove responsibility, it is always the better plan to deal with a nurseryman of repute, and pay a reasonable price. Such dealers are always prepared to consider any difficulty that may arise, and, in the event of a mistake, they are usually prepared to do their best to remedy it.

ANNUAL PUBLICATIONS OF FLORICULTURAL SOCIETIES.—W. T. L., Medmenham: The floricultural societies that issue an "annual" publication are the National Sweet Pea Society (Hon. Sec., Mr. C. H. Curtis, Adelaide Road, Brentford); National Rose Society (Hon. Sec., Mr. E. Mawley, V.M.H., Rosebank, Berkhamsted); and the Perpetual Flowering Carnation Society (Hon. Sec., Mr. Hayward Mathias, Lucerne, Stubbington, Hants). We refer you to the various secretaries for particulars.

GARDEN PATENT.—P., Rugby: In the first place, you should apply to the Comptroller-General of the Patent Office, 25, Southampton Buildings, London, W.C., for the necessary forms and information as regards charges. You should state that you desire to patent an invention for the improvement of garden frames, or to protect your invention pending the grant of a patent. Should you secure a patent you could sell it outright to a firm of horticultural builders, or sell it for a sum down and a royalty on each frame sold, or for a royalty only. The first thing is to protect your invention.

SOIL OF VINE BORDER.—S. N. C., Devon: The soil is far too light and sandy for vines, and is lacking in organic matter. Thorough improvement can only be effected by the removal of the soil in the upper layers of the border, and the addition of a sufficient quantity of roughly broken fibrous loam, inclined to be heavy, and that has been stacked some time. To the loam there should be added some ashes from burnt vegetable refuse. In other words, renovation of the border is essential for any degree of permanent success; the wood ashes may well constitute a tenth part of the new compost. If the loam is first rate nothing more need be added, but if it is not of the finest quality some bonemeal may be added, though this may be given more advantageously by way of top-dressing during the season of growth. If the vinery is a late one, and you have conveniences for dealing with the matter promptly, the work may be done at once, although the season is full late. As the old soil is removed take great care not to injure the vine roots, but tie these up loosely in bundles, in damp mats, relaying them in position as the new soil is added. Make all quite firm, working the finer soil among the roots, and give a good watering when the work is complete. Cover the surface of the border with long litter—not hot, steamy stuff—when the vines begin to grow.

DAHLIAS FOR GARDEN EFFECT.—C. L. C., Mitcham: With reference to varieties, we have dealt with the subject on several occasions, and shall do so again ere long. The cultivator whose aim is to have a bright display of colour, and a plentiful supply of blooms for cutting, must not trouble much about perfection of form in the flowers; but must select varieties neat in growth, profuse in flowering, and carrying their blooms well above the foliage, on stiff, erect stems. Dahlias grown for garden decoration do not require a very rich soil. A moderate dressing of manure will suffice, but a deep stirring of the soil is desirable. The plants should be bedded out at the end of May, and if they can be shifted into five-inch pots early in that month it will be an advantage. Owing to the comparative shortness of the English summer, it is most important to have strong plants when the time arrives for bedding them out. There will be a gain of several weeks by the use of strong plants in five-inch pots, as compared with small examples in pots three inches in diameter.

ROLLING TENNIS LAWN.—G. P., Buntingford: Sweeping and rolling are excellent for keeping a lawn in good condition, and are quite necessary in the case of a lawn used for tennis, croquet, etc. Sweep the surface lightly, and then roll the lawn, and roll lengthways on one occasion and crossways the next. Do not sweep, roll, or otherwise work on lawns when they are frozen.

GREENHOUSE PLANTS.—S. J. C., Cambridge: You will find excellent lists in "The Gardening Year Book" of 1911, obtainable post free for 1s. 3d. from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

SOLANUMS.—W. S., Alresford: Do you mean Solanum Wendlandi? If so, please send us a postcard to that effect.

NAMES OF PLANTS.

G. H., Downe.—A variety of Cypripedium nitens.

F. L., Aberfeldy.—1, Cypripedium Calypso; 2, Sedum Sieboldi.

W. G. F., Salisbury.—Probably Eranthemum cinnabarinum.

M. D. D., Tiverton.—1, Not recognised, poor specimen; 2, Crassula imbricata.

N. D., Jersey.—1, Begonia Martiana; 2, B. Gloire de Sceaux; 3, Eriobotrya japonica.

D. T. S., Exeter.—1, Lælia anceps; 2, Eranthemum pulchellum; 3, Allium neapolitanum.

C. S. L., Farnham.—1, Juniperus virginiana; 2, Arbutus unedo; 3, Hedera dentata; 4, Gaultheria procumbens; 5, Jasminum nudiflorum; 6, Abies Douglasi.

S. O., Swindon.—1, Primula kewensis; 2, a garden variety of amaryllis, or hippeastrum—good colour, but poor form; 3, Odontoglossum Wilckeanum.

NOTE OF THE WEEK.

The Founder of Vegetable Physiology.

As briefly announced in our issue of the 21st inst., a course of ten lectures on the "History of British Botany" is being given on Friday evenings at the University College, Gower Street, London, and we are pleased to see that the opportunity for hearing lectures on this interesting subject by scientists of the highest eminence, and free of cost, is being taken full advantage of. The first was given by Mr. Francis Darwin, F.R.S., and his subject was "The Life and Work of the Rev. Stephen Hales, D.D.," who may unquestionably be described as the founder of vegetable physiology in this country, and who has for upwards of two hundred years exercised a considerable influence upon the study of this important subject. His influence has been felt not only in this country, but in all parts of the world where the study of botany is regarded as an essential part of a liberal education. For a long period the results of his experiments in plant transpiration, the flow of the sap, etc., was regarded by botanists as all sufficient, and until within a quite recent period the most important of them were given a prominent position in the leading botanical text-books. This is all the more remarkable from the fact that, unlike later investigators, he had no "finger-posts" to indicate the course he should take. Hales was born on September 17, 1677, at Bekesbourne, a village near Canterbury, and, as his family occupied a good social position, he had the advantage of a university education. He proceeded to Cambridge in 1696, and entered Corpus Christi, and would appear to have been successful in his studies, for he obtained his M.A. degree within a comparatively short period, and was elected a Fellow of his college in 1702. During the time he was at Cambridge he found his relaxation in collecting wild flowers and geological specimens and the study of astronomy and chemistry. Entering the church, Hales was presented about the year 1710 to the perpetual curacy of Teddington, and, although subsequently receiving other appointments, he remained at Teddington until his death, which occurred in 1761. When settled in his new home, Hales entered with zest into his scientific investigations, and evidently with success, for seven years later he was elected a Fellow of the Royal Society. It must, however, be said to his credit that he did not allow his scientific investigations to interfere with his duty to his parishioners, for he made a strenuous effort to combat intemperance, and he was instrumental in providing the village with an abundant supply of pure water. The first contribution to the "Philosophical Transactions" of the Royal Society after his election, was devoted to an account of some experiments he had made on the effect of the heat of the sun in raising the sap of trees, and this was received with much favour by his contemporaries. In 1726 was published Hale's "Vegetable Stactics," which, if but a small 8vo, with a limited number of pages, was sufficient to bring its author enduring fame and to prove of immense value to students of plant physiology during a period of time that may be reckoned by centuries. In this small book were described the experiments by which he had proved to demonstration the rate of the evaporation of moisture from leaves of certain plants, the ascent of the sap by the wood vessels, the force of root pressure, the

MR. W. H. MASSIE.
President of the Scottish Horticultural Association.

lateral motion of sap, and the absorption of air. The publication of this work created an immense amount of interest in scientific circles; and as the result the book soon passed through numerous editions, and was translated into several languages. The experiments therein described were repeated by subsequent investigators, and as the results generally were fully confirmed, the book became the source whence, as briefly mentioned above, authors of botanical text-books turned for trustworthy evidence of some of the more important vital processes of plant life. Hales also devoted a large share of his attention to the invention of a system of ventilation for hospitals, prisons, mines, etc., and, with reference to this, it must suffice to briefly mention the fact that it proved remarkably successful. He was also the first to devise a system of ventilation by which warm air could be introduced to plant houses. He prepared a piece of bent tube of a size suited to the dimensions of the structure. A portion was buried in a bed of fermenting materials within the structure, and one end was taken outside and the other end carried above the bed. The air in passing through the portion of the tube embedded in the fermenting materials was warmed, and by providing small openings at the apex a circulation was maintained without cold air coming into contact with the plants. Hales conducted his experiments in a plant house at Kew that occupied a site not far distant from the structures devoted to the collection of tropical ferns. The old specimen Wistaria trained to the cage-like trellis contiguous thereto was trained over the walls of the plant house, and was carefully preserved when the latter was demolished, and thereby became an attractive memorial to Stephen Hales, who was not less remarkable for his estimable character than for his splendid achievements in the solution of problems relating to the vital processes of plant life.

Mr. W. H. Massie, the new president of the Scottish Horticultural Association is the senior partner of Messrs. Dicksons and Co., of 1, Waterloo Place, Edinburgh, and the Royal Nurseries, Craigmillar, Midlothian, a firm which has now been in existence for over 180 years. Mr. Massie is well known in horticultural and arboricultural circles. He is, besides being president of the Scottish Horticultural Association, a member of council of the Royal Caledonian Horticultural Society, and a vice-president of the Royal Scottish Arboricultural Society, and he is also a Fellow of the Botanical Society of Edinburgh. As a member of the executive, and convener of the Grounds Committee, he did yeoman service in connection with the Scottish National Exhibition of 1908, and recently he was approached by a number of influential citizens with a view to his becoming a candidate for municipal honours, a request to which he could not accede at the time. Unless, however, rumour be a lying jade, the time is not far distant when he will add civic to his other duties; and as we believe give further evidence of his geniality of temperament and commanding ability.

Sporting in Begonias. Mr. J. J. Hudson, V.M.H., sent to a recent meeting of the Royal Horticultural Society Scientific Committee a specimen showing sporting in winter-flowering begonias. Last year a sport had appeared on Begonia Agatha, with flowers larger and of a brighter colour than in the type. Plants were propagated from the sport, and came true, but on one plant one-half had again sported, and produced flowers still larger than in the first sport and with foliage twice as large. The committee expressed the hope that specimens of each of these sports should be kept and dried, so that comparisons could easily be made in the future and the whole history of the sports followed.

English Forestry Association.

At a meeting held at the Surveyors' Institution, on the 19th inst., it was resolved to form a society, to be known as the English Forestry Association, its object being "to organise the market and to encourage the use and demand for English timber." In moving that the association be formed, Lord Clinton, who presided, said those present represented a great many thousands of acres of woodlands, and were all anxious to improve the position of timber growing in this country. There had been a great revival in interest in forestry in recent years, and attempts had been made to get the State to realise the national importance of the timber-growing industry. The extension of the woodland area would have a very beneficial influence on the rural population. At the present time the return on timber growing was not very satisfactory. An exaggerated idea of possible profit was sometimes put before them, but he doubted whether a woodland owner, with woods in tolerably good condition, could expect to see 2 per cent. on his capital invested. They were, to a certain extent, responsible, and were suffering from the neglect of ordinary commercial ideas in the past as applied to forestry. There was in this country, he believed, a lower percentage of land under timber than in the rest of Europe. He believed there were comparatively few woods in England which had reached the limit of productivity. They must stimulate the demand for English timber by local industries, and by showing architects and others that it could be produced, like English oak, of better quality than anywhere else. There had been a falling off in the quality of imported timber as the older woods were becoming exhausted. The society would not compete with or interfere with the existing arboricultural societies, as its work was totally different. They were not going to buy and sell timber, but to try to remove things which at present handicapped the industry. The motion was carried, and Lord Clinton was elected president of the association; Mr. M. C. Duchesne was appointed hon. secretary and treasurer; and the following were elected to the council: Lord Clinton, Lord Shaftesbury, Lord Chichester, Lord Hastings, Mr. Courthorpe, M.P., Mr. Charles Bathurst, M.P., Mr. S. H. Cowper-Coles, Mr. F. G. Burroughes, Mr. Arthur Arnold, Mr. Gerard H. Morgan, Mr. W. Anker Simmons, and Colonel Mostyn.

Proposed National Daffodil Society.—We learn that an effort is about to be made to establish a National Society to do for the daffodil what the National Rose Society does for the rose. The movement has the support of most of those who are in one way or another prominently connected with the flower. Without in any way entrenching on the functions or the utility of local societies, it is believed that there is ample scope for such a body, with London as its headquarters. Two of the many ways in which it might do valuable work would be: (1) The holding of a great annual show in the Metropolis, and, (2) the publication of a Year Book in which everything of general interest might be focussed. We are informed that a public meeting is to be called on one of the days of the Royal Horticultural Society's Spring Bulb Show (March 14-15), when the promoters hope to have definite proposals to submit for consideration.

Kew Gardens and the Empire.

The useful work performed for the Empire by Kew Gardens seldom receives adequate recognition, and it is therefore pleasant to note the handsome tribute paid by Sir Daniel Morris, at a recent meeting at the Colonial Institute, to the famous scientific centre. Not only have the directors of Kew Gardens placed their unrivalled experience at the disposal of the Imperial Government and the Colonies, and trained the scientific staff required in the tropical parts of the Empire, but they have helped to create new industries. Perhaps the most striking service rendered by Kew was the successful introduction of quinine-yielding trees from Peru to India and Ceylon. Also the introduction of the Para and other rubber trees from Brazil and Central America to the East. The latter have made it possible to establish the important rubber industries now existing in India, Ceylon, and the Federated Malay States. Sir Daniel Morris seized the opportunity of bearing testimony to the splendid services rendered by the greatest of living botanists, Sir Joseph Dalton Hooker, who still follows with deep interest the results of his father's and his own efforts to develop the resources of our Indian and Colonial Empire. It would be impossible to overlook, also, the large share taken in similar work by Sir William Thiselton-Dyer, who for more than thirty years ably maintained the traditions of Kew, and ungrudgingly devoted himself to Colonial matters.

Pineapples with Rotten Core.—Some pineapples of excellent flavour, but with a brown rot in the core, were received by the R.H.S. Scientific Committee from Natal. Mr. Fawcett, one of the members of that body, said that the condition was very well known in the West Indies, and was prevalent in the variety shown, which he recognised as the deliciously-flavoured "Ripley," so much so as to render that variety unsuitable for shipment. Whatever the cause, he believed it originated before the pines were cut, i.e., while they were growing. The rot has been attributed to different causes by different investigators. It has been examined in the States, and said to be connected with the growth of a species of fusarium, which, presumably, gains an entrance into the root from the soil, but it does not appear to have been reproduced by inoculation by this fungus (see Jamaica "Botanical Bulletin," ser. ii., vol. viii. (1901), p. 83, vol. ix. (1902), p. 165.). Mr. Massee, in his "Diseases of Cultivated Plants," attributes the disease to physiological causes, pointing out that it is prevalent when the plants are ripening during the rainy season, and associating it with excess of water in the atmosphere. A similar trouble occurs in pine-pits in this country, especially when the plants are subjected to a check through a sudden lowering of the temperature.

East Anglian Horticultural Society, of which Mr. Lewis Smith is the president, has prepared an excellent programme for the current year, and in this the monthly competitions have a prominent place. Classes are provided at each of the monthly meetings for fruits and vegetables, and among the prizes offered is a silver challenge cup which has to be competed for at the May, July, and October meetings, when collections of cut flowers, vegetables, and fruit have to be shown at the respective meetings. Ten meetings for the reading of papers and discussion of matters of interest to horticulturists will be held, and four of these will be devoted to the reading of essays in competition for prizes, and at the meeting for March 8 the subject is "The Cultivation of Vegetables," and the competition is limited to under-gardeners.

Value of a Suburban Garden.—At the London Sheriff's Court, a few days since, a special jury ordered the London County Council to pay Mrs. Helen Pocock, of Mitcham Lane, Streatham, the sum of £282 10s., as compensation for compulsory taking about eight feet of her front garden for the purposes of the tramway that is being constructed.

Croydon Gardeners' Association.—From within a short period of its formation this association has occupied a leading position among kindred societies near the Metropolis, and the report for the past year affords ample evidence of this position being fully maintained. We learn with satisfaction that there has been a considerable increase in the list of members during the past year, that the lectures and papers have been of a high order of merit, that products of good quality have been contributed to the monthly meetings, and that the attendance has been most satisfactory. Several visits to gardens and nurseries were made during the year, and these, we learn from the report, were both pleasant and of high educational value to those members who were able to take part in them. One of the most interesting events of the year was the installation of the electric lantern, which was purchased by subscription. A first-class lantern for the projection of slides is of so much value to a society holding periodic meetings that we heartily congratulate the society on its new possession. The society has, we would add, arranged to have its annual dinner on Wednesday evening, February 15, 1911.

Leather from Vegetables.—According to the "Jewish Chronicle," a process has been discovered whereby a passable imitation of leather can be manufactured from a vegetable product. It is stated that the novelty owes its introduction to the enterprise of certain London vegetarians, who shuddered at the thought of the number of animals killed annually to keep humanity in boots. It is said that the imitation leather is being used for the manufacture of boots, shoes, book covers, and other articles. We have no information as to the vegetable product whence the imitation leather is manufactured, and we shall wait until we know something more about it before abandoning boots made with well-tanned horse, cow, or porpoise hide.

Rural Amenities of Berlin.—At the opening of the Prussian Diet it was intimated that legislative measures would be introduced for the purpose of effecting the union of Greater Berlin in questions relating to town planning. As part of the scheme it is proposed to preserve a belt of forest and meadow land round Berlin, to be administered by the City authorities, and to open up moor and waste land within the belt.

Fruit of Mandevilla suaveolens.—Mr. Chittenden contributed to the meeting of the Scientific Committee of the Royal Horticultural Society, on behalf of Mr Sanderson, of Joanville, Jersey, a pair of fruits of Mandevilla suaveolens which had ripened in the garden there. This plant is able to be grown outdoors only in warmer parts of England, and is not often known to fruit. The fruits, as in so many of the Asclepiadaceæ, are pods about twelve inches in length, and slender, and are produced in pairs.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The annual general meeting of this charitable and well-managed institution was held at Simpson's Strand, W.C., at 2.45 p.m., on Thursday, January 19, 1911, under the presidency of Mr. Harry J. Veitch, V.M.H. There were about twenty-six persons present at the opening proceedings. The notice of meeting and the minutes of the previous annual general meeting having been read, the annual report and balance-sheet were read by the secretary, Mr. G. J. Ingram, as follows:

REPORT OF THE COMMITTEE.

Before presenting the report of their work for the year 1910 the committee desire to record their sense of the very great and sad loss the institution sustained in the death of his Majesty King Edward, who, as Prince of Wales, was its president, and who subsequently, as King, honoured it by becoming its patron. His late Majesty had also for many years been a subscriber to its funds. The committee are very gratified to announce that his Majesty King George, who, until he succeeded to the Throne, was president of the institution, has graciously consented to become its patron, her Majesty Queen Mary having also accorded her patronage.

The committee have great pleasure in submitting their seventy-first annual report, together with statement of accounts as audited. They are extremely glad to be able to state that the charity has during the past year more than ever justified its existence by meeting the increased and urgent claims of deserving and needy applicants, who but for the aid thus rendered would have been utterly stranded in their difficulty and distress. It is now seventy-two years since the institution was founded, and during that time it has been able to distribute in relief upwards of £132,000, and at no other period in its history has it been able to do so much in affording timely aid to the necessitous horticulturist and his widow as in the year now closed.

At the beginning of 1910 two hundred and forty persons (one hundred and forty-one men and ninety-nine widows) were in receipt of permanent relief by means of annuities of £20 and £16 respectively, in addition to other applicants financially assisted in other ways. Of this number twenty-two have died during the year—thirteen men and nine women. Five of the men left widows whose circumstances being such as to render them eligible, the committee at once placed them on the funds of the institution without election, under rule III., par. 13, to receive the widow's allowance of £16 a year each. There were therefore at the close of the year two hundred and twenty-five persons receiving permanent relief, and to this number the committee recommend an election this day of twenty candidates from an approved list of seventy-three applicants, which will increase the number of beneficiaries to 250, being the greatest number there will ever have been at any time on the funds. Although this further addition to the permanent liability naturally causes the committee considerable anxiety, they feel assured of the approval of the supporters of the charity, whose interest they confidently hope will be stimulated to still further exertions on its behalf.

With regard to the temporary assistance rendered to applicants it would be impossible to overestimate the importance and value in cases of emergency of the "Victorian Era" and the "Good Samaritan" funds. The former fund provides assistance to those unsuccessful candidates who have been subscribers to the institution and who are awaiting election. The latter fund gives immediate help to deserving applicants, whether they have been subscribers or not, in time of misfortune and distress. It would be difficult indeed to exaggerate the real benefit thus conferred on these poor people, and many are the grateful letters received from those who have been thus helped. In connection with the "Good Samaritan" fund, the committee have much pleasure in acknowledging the receipt of £62 17s., the balance of the "Harry J. Veitch Portrait Fund," which the treasurer, the Rev. W. Wilks, requested might be so utilised. It would perhaps be well to again remind the friends of the institution that the interest only from these funds can be used, and therefore any special contributions to either or both of them would be warmly welcomed and gratefully received.

The committee are pleased to report that the seventy-first anniversary festival dinner, held at the Hotel Metropole in June last, was very successful, and they gladly tender to the Hon. Harry Lawson, M.P., their grateful thanks for presiding on the occasion, and for his eloquent advocacy of the claims of the charity, as well as for his generous personal contribution to the funds. The committee would also express their deep indebtedness to those gentlemen who were good enough to act as stewards or collectors; likewise to the horticultural Press for their gratuitous and invaluable assistance; to the donors of flowers, to those who kindly arranged the floral decorations, and to other friends for extremely useful services, which were very much appreciated.

The Messrs. George Monro, Ltd., Concert Committee again gave a portion of the proceeds derived from their well-known annual concert for the benefit of the funds, and the committee offer them their best thanks. It is sincerely hoped that other friends will emulate these examples.

The death-roll in relation to the charity was a heavy one during the year. In addition to that of H.M. King Edward, to which reference has already been made, the committee have to lament the loss of Baron Schröder, whose death was such a great blow to horticulture. He was a vice-president, and for many years one of the warmest and most generous supporters of the charity, to which he bequeathed a legacy of £1,000, duty free. As a tribute to his memory, and in recognition of his great service in connection with the erection and equipment of the Horticultural Hall and offices, the Royal Horticultural Society have established, in connection with our institution, a permanent annuity to be known as "The Baron Schröder Annuity," the first recipient of which, nominated by the society, is Mrs. Wildsmith, the widow of a very highly esteemed friend of the charity.

The committee have further to regret the loss of two of their valued colleagues, viz., Mr. William Denning, who was a regular attendant at its meetings for many years, and Mr. J. McIndoe, V.M.H., who were always ready to further in every possible way the interests of the institution. Their presence and help are sorely missed. Other sad losses are those of Mr. W. J. Nutting, formerly a member of committee, and for many years a valued subscriber, who passed away full of honours in a ripe old age; Mr. R. Wilson Ker, of Liverpool; Mr. J. L. Woodroffe, of Eastbourne; Mr. E. C. Mott, of Barnet; Mr. R. Blake, of Salisbury; and Colonel Hanbury Barclay, whose places it will be indeed difficult to fill.

A fund inaugurated during the year in memory of the late Mr. David Thomson has been successfully completed, and the amount raised has been added to that previously contributed with the same object to his brother, the late Mr. William Thomson's memory. The total sum has been invested to produce £20 a year, to establish a perpetual annuity in memory of these two distinguished horticulturists, which will henceforth be known as the "William and David Thomson Memorial Fund," and a worthy old Scotch gardener living in Edinburgh in very distressed circumstances has been selected by the Messrs. Thomson's family representatives as the first recipient of the benefits thus established.

In consequence of the partial rebuilding of the offices until recently occupied, the committee have been obliged to seek new premises, and they are glad to state that suitable quarters have been obtained at 92, Victoria Street, Westminster, close to Victoria Station, and not far from the former address.

The seventy-second festival dinner in aid of the funds has been arranged to take place on Tuesday, May 23 next, the first day of the Temple Flower Show, when Sir Marcus Samuel, Bart., has very kindly promised to preside. The dinner will be held, by kind permission of the guild, in the beautiful hall of the Grocers' Company, Princes Street, City, opposite the Bank of England. It is hoped that this function will meet with much success, and that the chairman will be ably supported by every lover of gardening and flowers. Ladies and gentlemen are earnestly solicited to act as stewards on behalf of the festival.

In concluding their brief summary of the year's work, the committee, whilst deeply thankful for what they have been able to accomplish, deplore their inability, from want of funds, to meet the claims of many other deserving applicants that come before them. They would, however, remind the friends of the institution that at each election for the past twenty years the liabilities have been increased, and the number of annuitants on the funds added to. They therefore plead most earnestly that a larger measure of support may be forthcoming in order that the work of this national horticultural charity, which has been carried on with such gratifying results for seventy-two years, may not only be maintained, but may be still further enlarged.

* Required to meet the quarterly payments on January 1, 1911.

The Chairman, in moving the adoption of the report and balance-sheet, added to his motion, "That the best thanks be tendered to the committee for their services." He felt that the work of the year was the best on record. Many of the applicants had been assisted, but very many would, he was afraid, have to wait many years before they received a pension. If the proposal to add twenty pensioners was carried it would mean that 245 persons would be on the funds. In future newly-elected pensioners would at once receive a half-quarter's pay, which would be, he felt, most acceptable. He referred to the working of the Good Samaritan and Victoria Era funds, and the immense aid they were able to afford applicants awaiting election. Mr. Veitch also referred to the Baron Schröder and the William and David Thomson memorials, which would commemorate well-known horticulturists, and materially assist the Institution.

Mr. A. W. Sutton, V.M.H., moved the re-election of Mr. Harry J. Veitch as treasurer of the Institution, and that he be thanked for his past services, and this was seconded by Mr. P. White, and carried unanimously. Mr. H. J. Veitch suitably responded, and he then proposed in a few very pleasing and eulogistic remarks the re-election of Mr. G. J. Ingram as secretary; Mr. G. Wythes seconded the motion, and it was heartily carried. The re-election of the retiring members of committee, Messrs F. Cooper, C. R. Fielder, W. Iceton, A. W. Paul, William Robinson, Joseph Rochford, Edward Sherwood, H. E. Tilman, and A. Watkins, was proposed by Mr. W. Poupart, and Mr. P. Veitch, and the election of Messrs. James Walker and J. Jacques wa also carried. The old auditors, and also the old Arbitration Committee were re-elected, Messrs. O. Thomas, J. Wheeler, and W. Iceton speaking to the motions. Messrs. E. G. Monro, P. White, and F. Cooper were appointed scrutineers, and the meeting was then adjourned until the declaration of the poll.

The poll was announced about 4.45, and the following were declared to be elected, viz.: Arthur Plummer, 4,062; W. M. Baillie, 3,162; Suzannah Butters, 3,030; Thos. Sutton, 2,943; Thos. C. Gidley, 2,832; George Boothroyde, 2,816; Sarah Chinnery, 2,780; Rebecca Watson, 2,746; Emily Richards, 2,729; John Birch, 2,716; John Gough, 2,656; Fanny Bury, 2,607; John Dallimore, 2,585; Emma Arnold, 2,577; George Bastin, 2,576; Sarah A. Sutton, 2,516; Reuben Cavill, 2,457; Mary Hope, 2,446; William D. Robinson, 2,423; and Anne Seaving, 2,420. In accordance with clause 10 of Rule III., the committee recommended the election of two other pensioners to fill vacancies recently caused by death, and they suggested George Gedge (2,375), who was applying for the fourth time, and totally incapacitated; and Henry J. Rosam (2,073), who last year enjoyed a special allowance contributed by Mr. A. W. Sutton. This was agreed to.

It was announced that Mr. G. Monro would give £10 to a needy unsuccessful widow, and Marie Baillie (455 votes), was selected; it was further announced that Mr. A. W. Sutton would also contribute an allowance to an unsuccessful candidate, and David Dunstall (1,376 votes) was selected to benefit therefrom.

On the motion of Mr. G. Paul, V.M.H., a hearty vote of thanks was accorded the chairman, and the scrutineers. This closed the proceedings.

The total numer of votes polled was 128,850, and there were 450 lost owing to unsigned and otherwise spoiled papers. One candidate polled between 4,000 and 5,000; two polled between 3,000 and 4,000; thirty-one between 2,000 and 3,000; twenty-five between 1,000 and 2,000; and fourteen polled fewer than 1,000 votes.

FRIENDLY SUPPER.

Mr. Joseph Rochford presided in the evening at the friendly supper, and for the first time since its institution the famous "Lark Pudding" was absent from the menu. Most of the members of committee were present to support the chairman, and the party of about three dozen included Messrs. H. J. Veitch, N. N. Sherwood, John Rochford, Edmund Rochford, Edward Sherwood, P. Veitch, G. Bunyard, W. Y. Baker, G. Paul, W. Atkinson, O. Thomas, J. Seegar, J. Vert, W. Iceton, J. F. McLeod, P. R. Barr, G. Barr, E. Monro, A. White, W. Howe, W. T. Anderson, A. W. Paul, A. Monro, etc.

FLORA OF THE BERNESE OBERLAND.

On Tuesday evening, the 17th inst., under the chairmanship of Mr. Charles E. Shea, the usual monthly dinner of the Horticultural Club was held at the Hotel Windsor, and was well attended. As usual, it was followed by a lecture, which on this occasion was delivered by the Rev. Canon Horsley, J.P., on "The scenery and people of the Bernese Oberland, including Swiss plants," and illustrated by a large number of very beautiful lantern slides, some taken by the lecturer himself, but the bulk by Mr. Malby, of Woodford, and Mr. Bell, of the Glasnevin Gardens, Dublin, who recently accompanied the Canon on his annual excursion into the Swiss Alps, which he is accustomed to take in conjunction with a selected body of ladies and gentlemen, to whom he acts as guide and mentor. The slides fell into two categories, or rather three, viz., Alpine scenery on the most stupendous scale; its flowers individually photographed in situ; and, thirdly, and in some respects, the most striking of all, a series of photos taken in Mr. Malby's suburban garden at Woodford within an area of about 160 feet by 60, in which Alpine scenery has been so artistically planned on a miniature scale, and Alpine plants grown under such natural conditions, that resulting photos taken from judicious points of view, and under conditions of haze and hoar frost, were almost indistinguishable in effect from genuine Alpine scenery. Groups of saxifrages and similar evergreen Alpine plants, thickly fringed with hoar frost, afforded some of the prettiest views conceivable, and it was generally admitted that if some of the rockwork slides from this little garden had been judiciously dispersed among the true Alpine views no one present could have discriminated the difference.

Canon Horsley, who takes a particular interest in floriculture for the masses, introduced these as an example of what picturesque effects may be attained within small areas when planned on intelligent and artistic lines.

An interesting point in the Canon's address related to the rapid retreat of the Swiss glaciers up the valleys which they had shaped. Within his own memory the foot of one noted one is now a mile and a-half from the point where he first visited it, and Mr. Shea, who is a member of Alpine clubs both home and foreign, and familiar with all Alpine points of interest, confirmed that this retreat was general, constituting an indication that the great ice-cap which in the so-called glacial period extended from the Pole over all Northern Europe and the greater part, if not the whole, of Britain, and of which the existing glaciers represent but the fringe of the remainder, is very rapidly diminishing, owing to some subtle change of climate. A large number of the Swiss flowers were admirably taken, and each was accompanied by remarks relating to its habit and habitats, constituting zones, so that the Canon had frequently been able to refute accounts of ascent to extraordinary altitudes by examining the flowers there collected, a couple of thousand feet or so being thereby deducted. The curious fact that that little gem, the Soldanella, of which two species were shown, actually thaws the superincumbent snow or even ice by self-engendered warmth, and so projects its charming flowers through the mass into the sunshine, was described. In the subsequent discussion in which Mr. Shea and Mr. Bilney took part, the mountain floras of other regions were compared with the Swiss, and a very cordial vote of thanks was given to Canon Horsley, and also to Mr. Malby, who was present, for the lecture and for the slides presented. An exhibit was also made of a charming series of Swiss postcards depicting the Swiss flora in natural colours, and some independent photos in natural colours were also highly appreciated.

SUPPORTS FOR ROSES.

Many "dwarf" roses require some support quite as much as in the case of pillar and standard-grown plants. For example, we cannot induce Earl of Dufferin and other heavy flowers, that are produced upon long and very slender growths, to hold up. There is, fortunately, a great choice in our dwarf roses, but this is not the case when we come to standards, and more especially those extra high weepers now so popular.

Sticks or stakes may be used for the ordinary standard, but they last only a few seasons if kept below dimensions that can only be called cumbersome. Square lengths of pitch pine are rather expensive, still, I think they are the best in the end among wood supports, and they seem to last longer if placed in the soil the reverse way from which the wood grew.

By far the best permanent support for standard stems that I have found are the hollow galvanised pipes used for gas and water. Though dear at first, they never wear out, and can be used as stakes for other subjects. There is the advantage also of great strength, compared to size, and they are not unsightly. Having no points or sharpened tips there is nothing to rot or decay just at the very point that we need the firmest support, while we can have them in any size, and any desired colour, if one objects to the natural hue. Being galvanised, they do not rust through ordinary exposure.

I am aware there was once a great cry out against the use of any iron stakes or supports because of the supposition they attracted both heat and cold, as well as electricity. This has not been proved by my own experience. So far then for the ordinary standards.

My chief object in these notes is to mention a few suitable supports for our tall standards, and more especially those that are used as weepers. I have seen several very ingenious home-made contrivances for this object, and several are on the market, and have been advertised in the gardening press. These, I need say little of, for they are naturally the best for the purpose, but somewhat expensive; still, they last well.

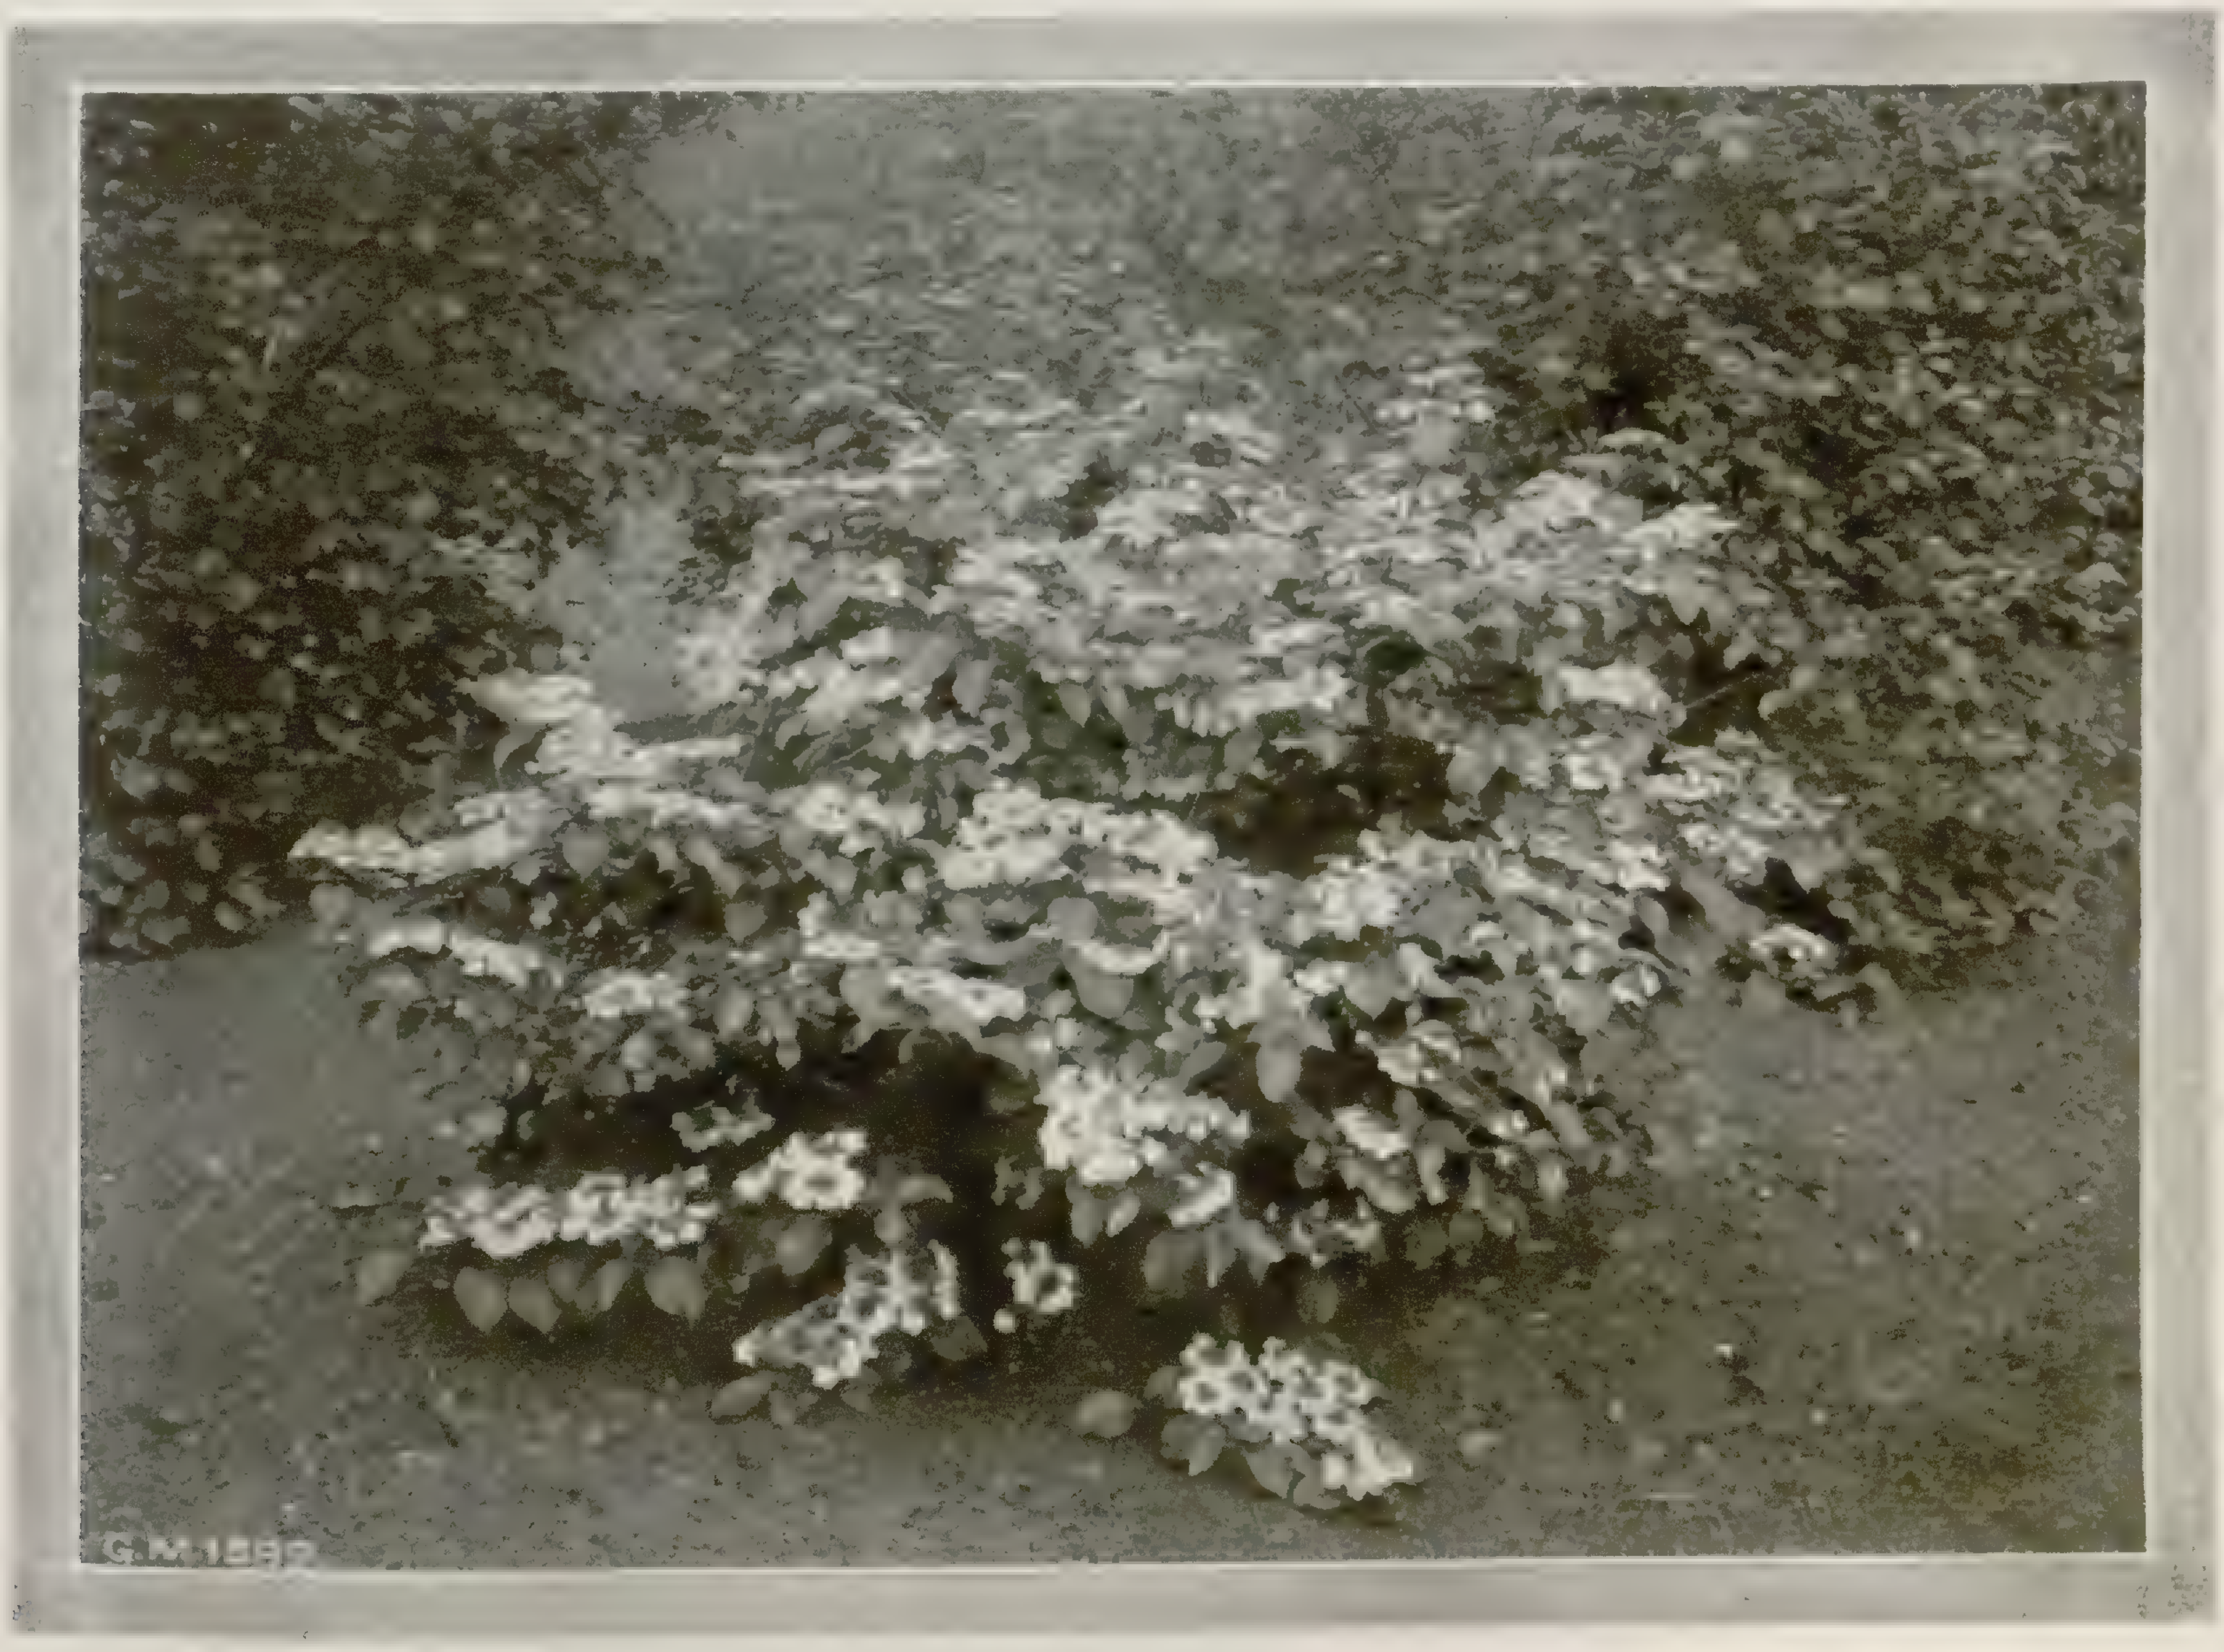
Recently, a reader of these pages wrote me respecting an article on "Wichuraianas as Standards," which appeared in conjunction with a photograph of specimens of Dorothy Perkins. The part that interested me most was his remark about the possession of a certain variety (Robert Craig), which was, unfortunately, upon a rather low stem. A strong shoot had broken out from about the centre of the head, and this he trained up a stout bamboo cane, heading the shoot last August. The result was it broke out into long laterals that promise a good show next summer. It is a cheap, effective, and simple idea of getting additional height where required, and can, of course, be used with any other strong-growing rose. The idea is excellent, and, judging from the sketch he was good enough to send me, might well be adopted among this class of rose.

A. P.

The Age of Gooseberry Trees.—I note, on page 30, that Mr. A. Petts, in dealing with the mistakes made in growing gooseberries, advises, "After two years, or at the most three, the old bushes may be destroyed." To me this seems an expensive method of obtaining gooseberries. Here we have trees that have given full crops for the last thirty-two years, with but two exceptions, and that owing to spring frosts. Red currants, too, are of the same age, and still give good annual returns of fruit. Surely this is an error on the part of Mr. Petts to advise the removal of the trees after three years; one would have thought ten years a brief existence.—E. M.

VIBURNUM TOMENTOSUM.

Until within a comparatively recent period this handsome Japanese viburnum was alone represented in British gardens by its sterile form, which, under the name of Viburnum plicatum, has deservedly enjoyed a high degree of popularity, and been largely planted in gardens where hardy shrubs remarkable for the beauty of their flowers are appreciated. A few years since the species was introduced from Japan, of which country it is a native, to this country; and although not regarded and properly so, as superior to its sterile variety, it has been recognised as a shrub worthy of a place in the shrubbery border, even when of moderate size. It has been freely planted, and in a considerable number of gardens may be seen specimens of a size sufficient to show its distinctive characteristics. The example we have the pleasure of illustrating herewith occupies a place in the viburnum collection at Kew, and, as so well shown, is free flowering and decidedly attractive. It will be seen that the flowers are single, and elegantly disposed along the branches in clusters. These flowers, it should be added, are pure white. There is no occasion to institute comparisons between V. tomentosum and its well-known variety, the correct designation of which is V. tomentosum plicatum, for they are perfectly distinct from each other, and they both possess much beauty. The last-named is the most suitable for lawn groups, because of the greater effect it is capable of producing, but the species is a charming shrub for planting in a mixed shrubbery border, and the aid it is so well able to render in making such borders interesting and attractive should be taken full advantage of by planters.



VIBURNUM TOMENTOSUM.
A beautiful hardy deciduous shrub of Japanese origin and bearing a profusion of white flowers.

HERBACEOUS CLEMATISES.

At one time or another a great deal has been written about various types of clematises, but it has usually been the shrubby types, as represented by the florida, patens, lanuginosa, Viticella, and Jackmani groups which have received attention, and little notice has been taken of the herbaceous kinds. They are, moreover, rarely met with in our gardens, therefore a few words in their favour may not be out of place.

The group contains a rather large number of species and varieties which show a considerable amount of variation in habit and in shape and colour of flowers. Some grow but a foot or two high, whilst others may attain a height of six or eight feet, or even more. The leaves of a certain number of species are divided into numerous finely-cut leaflets, others have them separated into a few large lobes, whilst several bear simple leaves. The flowers also differ considerably in shape, for some species bear blossoms very like those of C. Viticella and others produce tubular or urn-shaped blooms. The strong-growing ones are not difficult to cultivate, and are quite as deserving a place in the herbaceous border as other perennials. In deep loamy soil they may be expected to give a good account of themselves, but care must be taken to stake them before they become too advanced to support their own weight, for if they are once allowed to fall prostrate on the ground they cannot be made to look so well as if they are kept upright from the commencement of their growth. Some kinds may be most successfully dealt with by placing a number of straight stakes round a clump and surrounding them with several rows of string. Others are more satisfactory if surrounded by sticks, such as are used for ordinary garden peas, and the branches trained amongst them. Some kinds are rank feeders, and they are benefited by a top-dressing of rotten manure applied in April, while all enjoy a liberal amount of lime in the soil. Those sorts which form extensive root-stocks may be increased by division, and most kinds can be propagated from seeds which set freely.

Perhaps the best known of the various herbaceous kinds is C. recta, a species from southern Europe, which grows from two to three feet high. It forms a large clump, and produces a considerable number of growths, each one of which bears a head of fragrant white flowers in early summer. There are several varieties which differ in height, strength, and size of inflorescence from the type. A distinct change from this plant is found in C. Hendersoni, a hybrid between the shrubby C. Viticella and the herbaceous C. integrifolia. It grows from four to six feet high, and bears a profusion of blue or purplish flowers over a period of quite two months, which, individually, are as large as those of C. Viticella. It is easily one of the most showy and most worthy of inclusion in the herbaceous border. Closely following the last-named in free flowering is C. Bergeroni, a strong grower, which bears large pinkish flowers. C. Clocheton is another of the same type, which bears large numbers of blue flowers somewhat larger in size than those of the last two sorts. All three look at their best when grown over pea-sticks.

The American scarlet-flowered species, C. coccinea, is fairly frequently met with, for it is used as a wall plant. Its showy, scarlet, urn-shaped flowers and glaucous leaves make it a conspicuous object. Crossed with shrubby garden kinds a set of free-flowering hybrids has been obtained which are of herbaceous character. All are of vigorous habit; good ones are Countess of Onslow, Duchess of Albany, Duchess of York, Grace Darling, and Sir Trevor Lawrence. C. coccinea is rather tender, and these hybrids cannot be recommended for cold parts of the country. C. integrifolia is a rather low-growing species with simple leaves and blue flowers. A variety with white flowers, known as alba, may be obtained. C. intermedia is a tall-growing species, attaining a height of five feet or more. Purple, white and pink-coloured forms may be obtained. The three species, C. Viorna, C. vernalis, and C. Fremonti are not particularly showy kinds, and are more interesting on account of their curiously-shaped flowers than by reason of their decorative character. The same thing may be said of C. globosa, which has glaucous leaves and purple, urn-shaped flowers. C. pseudo-flammula is a dwarf Caucasian species which has small white fragrant blossoms and glaucous leaves.

Another set which might well be included in this class is that made up of C. heracleæfolia and its numerous varieties. Though not of strictly herbaceous character, C. heracleæfolia loses the greater part of its branches each year, and is usually cut down in spring to within nine inches or a foot of the ground. From the lower buds strong branches are produced, which bear small tubular blue flowers throughout the greater part of their length, during August and September. It is a native of China, and has several varieties, of which Stans, Davidiana, Lavallei, Sophia, and Iris are more showy than the type.

W. Dallimore.

PEAR BEURRE HARDY.
An excellent dessert variety ripening in October.

TWO USEFUL OCTOBER PEARS.

Pears ripening in October and the following month are plentiful, and a considerable proportion possess much merit. We need not recapitulate them; but briefly refer to the claims which the two varieties herewith mentioned have upon cultivators.

Beurre Hardy.

This excellent pear has long been in cultivation, and is regarded with much favour by cultivators who are satisfied with moderate crops, provided the fruits are of good appearance and the quality high. Beurre Hardy is not so heavy a bearer as some other varieties that could be mentioned, but in a series of years it will give a good return. The fruits are rather large, and have a yellowish glossy green skin, which is marked with dots and patches of russet; the flesh is white, rich, melting, juicy, and pleasantly perfumed. It is deserving of a wall, but it makes an excellent pyramid, and may be most successfully grown in that form where pears succeed in the open quarters.

Durondeau.

This well known and popular pear may well be described as one of the best of those that under ordinary conditions attain maturity during the second half of October and the early part of November. The fruit is large, and as will be seen from a glance at the illustration, is handsome, its appearance being greatly enhanced by its brightly-coloured skin, which is yellow on the shaded side and crimson on the side exposed to the sun. The fruit is not only attractive to the eye, but is pleasing to the palate, the flesh being rich, sweet, and juicy. The variety succeeds as a pyramid in the open, but it deserves a wall, and should certainly have the shelter of one when grown in districts in which the soil and climatic conditions are not particularly favourable to choice pears. The tree crops freely and regularly, a point of much importance in estimating the merits of choice dessert pears.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

SOLD IN BAGS AND TINS BY SEEDSMEN, NURSERYMEN, ETC.

Manufactured — by — **THE CHEMICAL UNION, LTD, IPSWICH.**

2,500 BEAU-IDEAL BLUE BEDDING LOBELIA for 1d.

What is the use paying 1/- or 2/6 for a packet of Lobelia seed when you can get all the plants you require for a 1d. or 2d.? Of course, you have been paying these high prices in order to get the best seed. But you need do this no longer. All the seeds retailed by Stormonths are of the best procurable strains, equal to anything retailed at the old-fashioned prices, and they will supply any quantity, from 1d. worth upwards.

TAKE THIS LOBELIA AS AN EXAMPLE. The seed is warranted pure, of good germination, and true to name, saved only from plants raised from cuttings, propagated from stock plants selected true to type, compact in habit, perfect in colour and flower, and free blooming. In short, the finest improved English strains of Crystal Palace Compact Lobelia.

GARDENERS WHO WISH TO KEEP EXPENSES DOWN, and employers who desire variety as well as quality in their gardens, should send for a copy of Stormonths' Catalogue of warranted Beau Ideal Seeds, free on request.

STORMONTHS, 8, Kirkbride, Carlisle.

NEW ROSES

WM. PAUL & SON,
WALTHAM CROSS, Ltd.,

Beg to offer strong plants of the following New Roses raised by them at the Waltham Cross Nurseries :—

Varieties of 1910.

Alice Cory Wright (H.T.), Dwarfs, **7/6** and **10/6** each.
Elsie (Wichuraiana, Rambler), Dwarfs, **7 6** each.
Juliet (Hybrid Briar), Dwarfs, **10 6** each; Standards and Half-Standards, **10 6** each.
Portia (H.T.), Dwarfs, **7/6** each.

Varieties of 1909.

Althea (H.T.), Dwarfs, **3 6** each: **36**/- per dozen.
Cynthia (H.T.), Dwarfs. **3/6** each; **36**/- per dozen; Standards, **5**/- each.
Fairy (Multiflora Rambler), Dwarfs, **2/6** each; **24**/- per dozen.
Margaret (H.T.), Dwarfs, **3/6** each; **36** - per dozen.

For full descriptions of the above, and for New Roses of other raisers and general collection of Roses, see Rose Catalogue, post free on application.

Pauls' Royal Nurseries and Seed Warehouse,
WALTHAM CROSS, HERTS.

FRUIT TREES

We have 50 acres of young Fruit Trees in perfect condition to offer this season. Our **Specialities** are Cordons, Bushes, and Pyramids, and Trained Trees worked on selected **Fruiting Stocks.**

Fully Illustrated Catalogue Post Free.

W. SEABROOK & SONS,
The Nurseries, CHELMSFORD.

Orchids! Orchids!! Orchids!!!

The undersigned begs to announce to the Public that he is in a position to supply, wholesale or retail, **Burma Orchids** of 50 varieties at a moderate price. Further particulars on application.—**J. C. PRAZER, Orchid Collector, KALEWA, BURMA.**

VEITCH'S GENUINE SEEDS

VEITICH'S AUTOCRAT PEA.

A Few Specialities.

VEITCH'S ACME PEA.

Award of Merit, Royal Horticultural Society. A Fine First Early. Per Quart, **2/-.**

VEITCH'S CRITERION PEA.

A Splendid Main Crop Pea ; medium size ; abundant crop ; excellent flavour. Per Quart, **2/6**.

VEITCH'S AUTOCRAT PEA.

First-Class Certificate, Royal Horticultural Society. The Best Late Pea. Per Quart, **2/6**.

VEITCH'S NEW MAMMOTH WHITE RUNNER BEAN.

Equal to our Hackwood Park Success. Per Packet, **1/6 & 2/6**.

VEITCH'S INVICTA TOMATO.

A further trial has confirmed the high opinion formed of this new variety. Per Packet, **1/6**.

VEITCH'S DEFIANCE VEGETABLE MARROW.

A very distinct Marrow of splendid quality. Per Packet, **1/-.**

VEITCH'S SNOWDRIFT POTATO.

Handsome Tubers and Fine Flavour. Per 14 lbs., **3/-.**

ILLUSTRATED SEED CATALOGUE FREE ON APPLICATION.

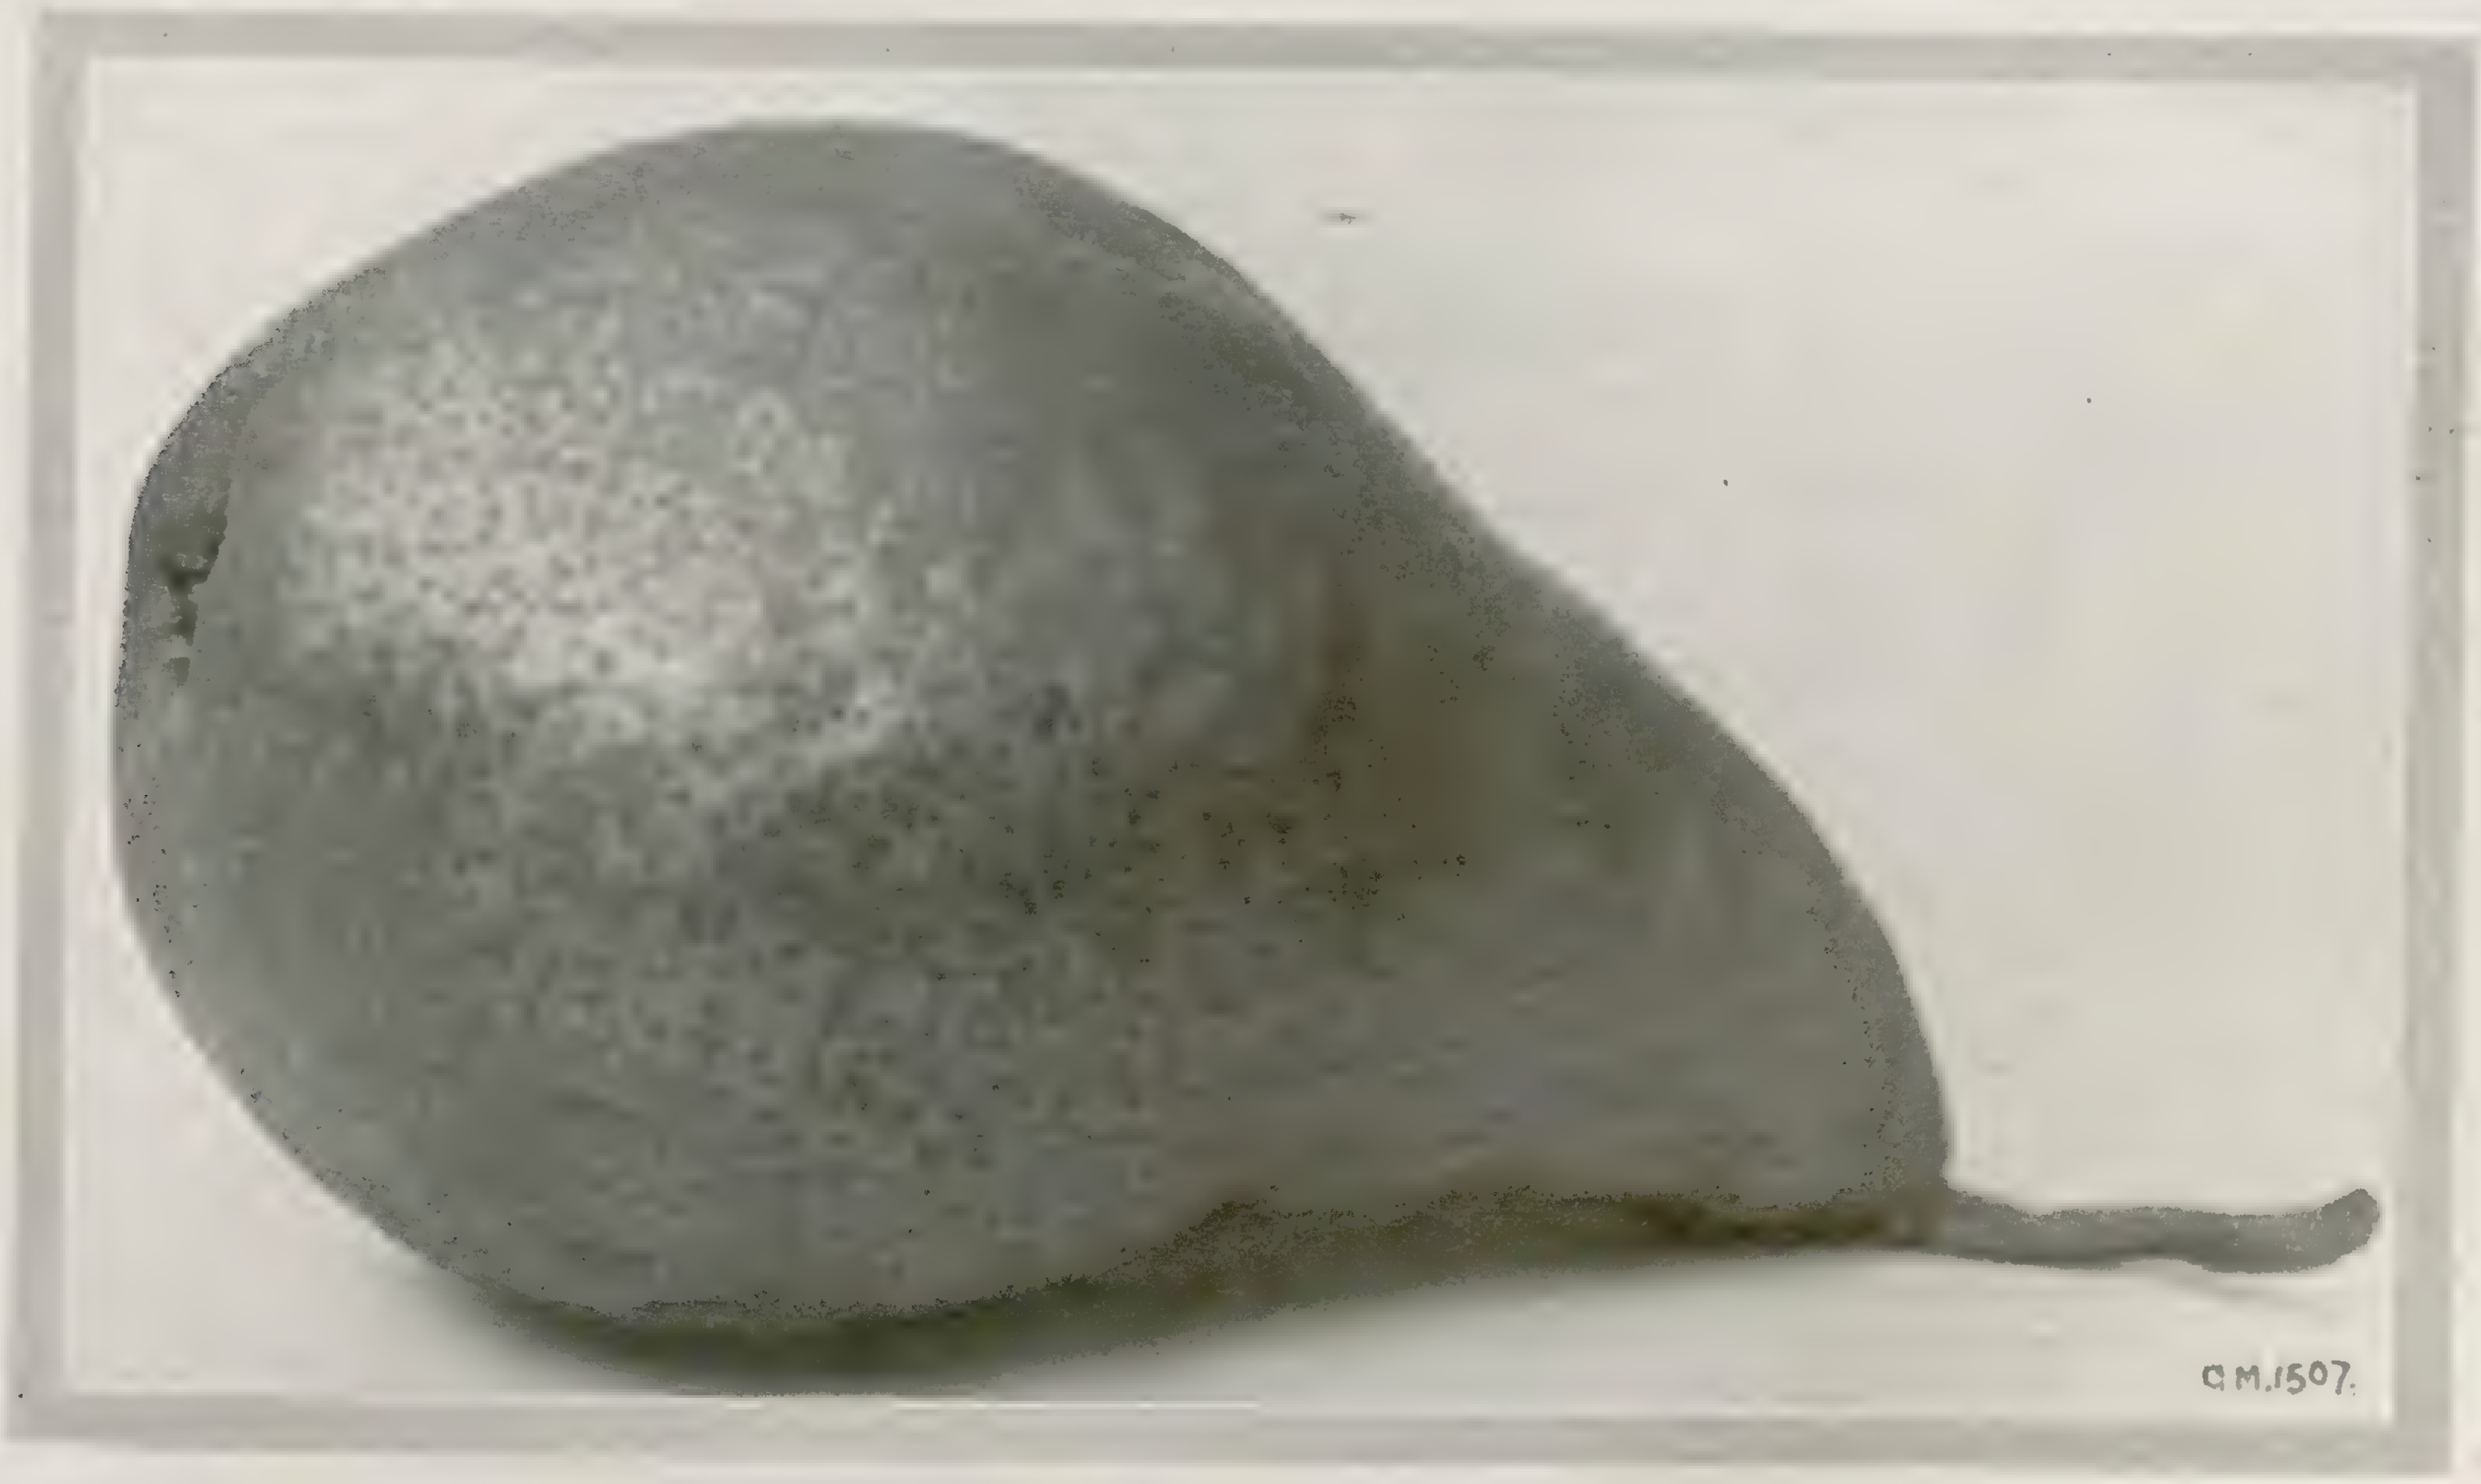
JAMES VEITCH & SONS, Ltd., Royal Exotic Nursery, CHELSEA,
LONDON.

HARDY PLANT CHAT.

◆

Meconopsis integrifolia.

Cultivators of such flowers will generally agree in regretting that this truly handsome meconopsis is only a biennial—a duration of life which is too common among the fascinating flowers of its class. This militates greatly against its popularity, for, so far as one can learn, it has not the powers of propagation from self-sown seeds presented by its ally, M. cambrica, which, as too many experience, is more than a shade too prolific for most gardens, and, once established, and allowed to seed, becomes a weed in very truth, although a very beautiful one. With a view to testing the self-seeding powers of M. integrifolia I have allowed a plant to scatter its seeds, and have given these every opportunity of germinating under natural conditions. Whether it will respond to my consideration is a doubtful question, but I am not at all hopeful.



G.M.1507.

PEAR DURONDEAU.
A valuable dessert variety ripening in October and November.

It would give me the greatest of pleasure could I once naturalise it in my garden. As those who know it are well aware, it is a truly handsome Himalayan poppy, with its fine foliage and its large clear yellow blooms. These are sometimes as much as eight or more inches in diameter, and a clump of good plants is a sight to be long remembered. I believe that the orthodox compost of equal parts of leaf-soil and peat is as good as any, but it is not indispensable, as M. integrifolia can be well grown in light loam and peat or leaf-soil. It grows about a foot and a-half high, in ordinary circumstances but I have seen it both taller and of less stature. I believe in early sowing for this species, and prefer to sow the seeds under glass in March. Self-sown plants left in position would give better specimens, however, and I am desirous of hearing from anyone who has succeeded in raising a stock from self-sown seeds.

Lupinus Somerset.

A good deal of disappointment is often expressed with respect to this lupin, owing, I think, to the fact that seedlings are often sold which have reverted to the tree lupin, which gives the hybrid its yellow colour. The true Somerset, as I knew it at first, was a true herbaceous lupin, but many of the plants called by its name are neither more nor less than plants of Lupinus arboreus. This is not surprising when we understand that plants have been raised from seeds saved from the hybrid, and that many of the seedlings have branched off in the direction of either parent. I had a most interesting talk one day, a year or two ago, with a keen amateur who had been hybridising the tree and herbaceous lupins, and he kindly sent me seeds saved from hybridised plants.

The seed bearer was L. polyphyllus, and the pollen parent L. arboreus. The seedlings came a very mixed lot, and I had a proportion of each class, but the colours were more varied than one would have been likely to secure from either parent unhybridised.

It is unfortunate that L. Somerset has this tendency from seeds, as its clear yellow flowers are nice, and make a good change from the ordinary colours of the many-leaved lupin.

Primula pulverulenta.

One wonders where the new primulas are going to end, and it is in every way likely that China will yet give us several more novelties, although one would almost think that P. Littoniana must have spoken the last word, so far as regards thorough originality among the wild species. What its influence on hybrids may be it is as yet too soon to say. I am merely introducing this unique species by way of remark, for at the present time P. pulverulenta is sure to be a most valuable plant for effect in the garden and for planting in places where P. japonica has hitherto held an almost unrivalled sway. Most of us know what wonderfully fine effects have been produced by P. japonica in the woods and by streamsides, and a great many of us can recall visions of beauty presented by masses of this fine flower. In pulverulenta we have a still nobler primrose, its towering stems, with their whorled flowers, looking more impressive and being capable of making a greater display, especially among rougher undergrowth, than those of P. japonica. Its fine crimson-purple flowers on their powdered stems are most effective, and when we have it in other colours, as we are certain to have some day, we shall have one of the finest of its race for the woods or wild garden, as well as for massing in the border or the rock garden. To grow it well this powdered primrose wants plenty of moisture, and in selecting positions for colonies of it this fact should be kept in mind.

Tecophilæa cyanocrocus.

Tantalus, with all his fruitless toil, had surely never a more disheartening task than that which awaits the owner of a slug-infested garden in endeavouring to grow the lovely "Chilian crocus," which bears the above name, of which it may be said that the more seldom we endeavour to repeat it the better. It is a truly lovely little bulb, with just that soupçon of tenderness which renders it an object of desire to many who cannot grow it. A little crocus-like plant, with flowers of the most charming shade of blue with a whitish throat, and almost gentian-like in the intensity of its colour, makes one long for its happy possession. But, woe is me! This isn't so easy to secure! Slugs travel for many yards to feast upon such a choice morsel, and they seem to brave all obstacles to regale themselves upon such a dainty, with the result that you go out and look for your tecophilæa, and find it cropped to the ground, the hope of the flower and the hope of establishing it in the garden having gone at one and the same time, at the call of a ruthless slimy horror! Still, if we can face the unsightly appearance given by gauze rings and a bell-glass or hand-light over the place where this Chilian crocus grows (which should be a sunny one), and thus give it the needed protection from the slug and rest from rain in summer, we may rejoice in a lovely flower we long to see again in all its beauty in our gardens.

S. Arnott.

THE NEW THEORY IN GARDEN DESIGN.

Progress is the watchword of the gardening community of to-day, and constant change and improvement marks every phase of horticulture. Energy and adaptation are needed by the garden maker at the present time in a far greater degree than ever before. We have noted the predominance of certain ideas in garden design, which, in their turn, have had to surrender the post of honour in public favour to other and newer ideas.

If one looks back and marks how change has followed change, and notes also how far we have advanced in the progress of garden design, he will be constrained to say with me that there is no decadence in garden art, no golden age of perfection to look back upon, nay, rather the golden age of garden art lies before us, a vision clear for the near future. The old English garden was all too rudely swept away by the formalism of the Italian and Dutch garden design. Geometrical patterns, studied stoneware, formal steps, stately fountains were embodied in many English gardens, while the clipped trees and the trim flower beds of the typical Dutch style became necessary adjuncts.

For a certain style of architecture the formal garden is the proper and only effective setting, giving a stately appearance to an imposing mansion. But, mark you, totally unfitted for many styles of residence as built to-day.

The fall of formalism is the direct outcome of the rise of the natural garden. First the herbaceous border, then the rock garden, followed by the water garden and the wild garden, with their relative subportions, the iris garden, the bamboo garden, the fern dell, the heath garden, and the bog garden, have effectively and for ever doomed mere formalism to second place, for never again after enjoying the delights of the more natural garden will the garden lover be beguiled back into the bondage of geometry and rigid lines.

It must, however, be fully understood that all designs for grounds surrounding a residence must be in accordance or harmony with the house; the garden must form a harmonious setting. On the other hand, the tendency to the open-air life is bringing new types of residences into favour. They are smaller, boasting more of the bungalow and country cottage than of the stately palace. This being so, it is easier to bring the natural garden into harmony with such erections, and one can utilise the old-world flagged stone pathway, the bowers of roses, the winding border with its Madonna lilies, pæonies, columbines, irises, etc., to say nothing of honeysuckles, carnations, with a lily pool as a finish. Where one can utilise such schemes in close proximity to the house one can bring the rocks, the running brook, the sloping banks, and valleyed depressions which go to make up the more modern additions to the natural garden.

But what of the "new theory"? It is some time since I emphasised the importance of combining the best features of the Japanese garden with our own natural garden ideas. Now I wish to further promote the ideal combination, the combination of scenic art with floral beauty. There is no need to be afraid of the idea. It is virile, throbbing with life and beauty. The possibilities stretch out beyond the horizon full and free, only waiting for the wit and brain and energy of the younger generation of garden makers to use them to the highest degree.

Examine the idea for yourself. Recognise the importance of studying detail, so that (like the Japanese artist) one can see the whole picture complete before one puts brush to canvas, or spade to ground. The study of proportion in design must be thorough. There must be no incongruous additions, no ultra-heavy schemes, nothing to overbalance or belittle the scheme. Thus it is that the Japanese are so successful in proportionate designs. The rise and fall of mound and valley, the outcrops of rock, the background of pines, the lotus pool, and the iris swamp are correct in their proportions one to another. The work is so carefully performed, the stones and trees chosen, and their abiding places settled, that to the ordinary beholder everything is perfect in arrangement.

There is no jarring note, no protesting incongruities, no rebellious colour designs. Colour may be shown vividly in places, with a background so sombre as to throw the colour into greater relief. Daring contrasts may exist, but there is no clashing of rebel hues, nothing wearying to the eye. All is harmony, peace. My endeavour will be to follow, as far as possible, the Japanese ideals, adapting it to our English surroundings.

Simplicity is the keynote; natural expression is the entire aim. If rocks are used, then let them form a living part of the entire scheme, a few natural outcrops, to be crowned with lowly plants or creeping bush.

If water be in request carry it through the depressions with natural lines and swinging curves.

Shrub plantings should be in good taste, a natural group of any one good subject being better than a bizarre mass. If the land is flat, break it up into waving slopes, graduated depressions, and crowning ridges. In a garden of this description stepping stones are better than gravel paths, and simple rustic bridges than ornate erections.

The backgrounds should, if possible, be dark: herein is mystery revealed. Put your sombre pines, your dark junipers, heavy cedars, stately cupressus, in the background. By so doing you can arrange your foregrounds with more telling effect. That dark cloud-like fringe of firs will throw into greater relief the snowy grace of the cherry or philadelphus. Azaleas like Hinodegiri, Daimio, rosæflora, will gain in fire and intensity. Japanese maples are rendered more charming, and the silvered lines of Acer negundo variegata are pictured in delightful contrast. Although a harmonious whole, the new garden is strikingly individualistic. Individual features will meet the eye at vantage points, and impress themselves upon the memory. It is indeed the ideal pictured garden.

The choice of plants and shrubs must ever be left to individual choice. Too few should be planted, rather than too many. A grand mass of Azalea mollis, or of the rarer Japanese favourites, are charming in their season; anemones and muscari may rove through them in spring with sheets of white and blue. Berberis, or veronicas may be under-run by some of the exquisite smaller violas. Utilise irises, delphiniums, tall campanulas in good positions, but carpet them with cerastiums, linarias, myosotis, and similar subjects. Let carpeting plants cover good breadths to each variety, no intermingled chaos, just simple widespread masses.

Grounds covered with these are quite as restful to the eye as green turf, and of far greater interest. Sedums are ever delightful surfacing subjects, while the showy taller S. spectabile is a fine distance plant, and mirrors grandly in water. Tritomas (the Torch Lilies of late summer) are grand, fiery, inspiring, and picturesque, and at their base can rise pale spring bulbs, followed later by the white blossoms of Saxifrage Wallacei, etc.

Hosts of equally effective combinations cross my mind. Irises and King-cups by the pools, astilbes and lythrums in stately beauty, nymphæas and nuphars on the water-surface. Sulphur, white, and golden brooms upon the dry banks, with waves of ericas beneath, which are a glory in late summer. A fern dell, where ferns mingle with foxglove, asperulas, hyacinths, blue and white anemones, and woodland lilies.

Simplicity must be the great ideal, a perfect harmony. If a garden room or tea house is needed, let the design be as simple, light, and artistic as possible. Cover it with Nature's coverings — wild vines or clematis, polygonums or wistarias, roses or honeysuckles. My few thoughts will, perhaps, be sufficient to convey my ideas. That there is a future for this style of garden I most firmly believe. It will come into far greater prominence, bringing with it a greater appreciation of garden art and artists. The whole survey of garden-work points to this ideal. What is needed is to put this virile, interesting, yet withal simple form of garden adornment into life at its fullest point.

The great days of garden-making are not past. The future is full of promise, and the next generation will witness even greater strides in our cherished horticultural pursuits than the last.

P. S. HAYWARD.

SUMMER-FLOWERING CHRYSANTHEMUMS.

Roots of early varieties which were boxed and placed in cold frames in the autumn for propagation, may now be afforded a little warmth to induce growth for cuttings. A night temperature of 50 deg. Fahr. is quite high enough, for if given too much heat the cuttings become weak and drawn. Boxes may be filled with a mixture of loam, leaf-soil, and sand, to be in readiness for propagating, and when the growths are about two or three inches long they may be taken and dibbled into the boxes, and placed in an early fruit house where they quickly root. When well rooted, and the cuttings commence to grow, the tops may be pinched out, as this will encourage side-growths. About a fortnight after stopping the boxes may be removed to a cold frame. As soon as the cuttings become accustomed to the change of temperature, they should be planted out in the frames, where they will make splendid stuff for spring planting. By following this method of cultivation no great check is experienced, and the plants are kept growing away freely. If allowed to remain in the boxes and become starved they never recover, and when planted out the results are very poor.

The following are useful varieties for bedding or cutting purposes: Horace Martin, yellow; Crimson Queen, Tapis de Neige, and Roi des Blancs, white; Nina Blick, golden bronze; Crimson Marie Masse, Pink Marie Masse, Mrs. W. Sydenham, dark crimson; Robbie Burns, rosy cerise; Ralph Curtis, creamy-white; and Goacher's Crimson. E. C. POOLEY.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net: or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WINTER MAMMOTH BROCCOLI.

The value of broccoli in the supply of winter vegetables is very great, and a vast amount of care and patience are expended upon the crops in private and in market gardens. In private gardens no pains are too great if they secure a good crop of neat white cauliflower-like heads, while in market gardens, especially along the south coast, and in the western counties of Cornwall and Devon, the crop is one of the most remunerative when well managed. The right selection of varieties is a point of great importance, and in this connection none are of greater importance than those that come into use at midwinter and the very early spring. One very excellent variety is Sutton's Winter Mammoth, which is highly valued by the Cornish market growers, who send beautiful heads to the London and other large markets during December and January. The heads are of good size and fine texture, while nothing is lacking in the matter of quality when the heads are cooked. At the recent meeting of the Royal Horticultural Society, Messrs. Sutton and Sons, Reading, submitted several dozen heads of this splendid broccoli, as well as a similar number of their slightly earlier variety named Early White.

ODONTOGLOSSUMS.

Being an ardent admirer of odontoglossums generally, and O. crispum in particular, I was much interested in the remarks made by Mr. H. J. Chapman about this class of orchids in the GARDENERS' MAGAZINE of December 31 last. I can fully agree with him, after much experience gained in our leading orchid trade establishments, that the vast improvement seen in the past few years in the cultivation of odontoglossums, and also the facility and ease with which seedlings are raised and grown, is due mainly to the warmer conditions under which the plants are grown in the winter and spring months. As Mr. Chapman points out, it is but a few years ago that we were advised by our leading authorities to grow them in a winter temperature of from 40 to 50 deg. Under such conditions as these, odontoglossums lingered, dwindled, and finally succumbed by the thousand, and the mystery to me now is, that this advice was followed for so long.

But old ideas die very hard amongst gardeners, and I have met with more than one gardener within the past three or four years who still try to grow odontoglossums under the old semi-starvation system. Odontoglossums should not be grown in a temperature which falls below 50 deg. at night, and the nearer this night temperature is to 55 deg. the better, and particularly does this apply to all hybrids descended from O. Harryanum.

Another factor, too which I consider has gone towards the higher cultivation of these plants, is the greater depth of compost used now than was formerly the custom. Under these more liberal conditions of cultivation, odontoglossums are now grown to a degree of excellence that could only have been a dream under the old conditions. And it is also, to my mind, these changed methods that have made possible the production of those fine hybrids which have done so much to beautify and enrich our orchid houses during the past few years. These hybrids are at once most easily grown and managed, and are at the same time highly decorative, and when their merits are more generally known they cannot fail to become appreciated.

A small selection of some of the finest and most easily procurable will include: O. ardentissimum, and its exquisite form O. a. xanthotes, O. Charlesworthi, O. Rolfeæ, O. spectabile, O. Ossulstoni, O. Cooksoni, O. eximium, O. Lambeauianum, and O. Phœbe. But anything written about odontoglossums would be incomplete without allusion to those two grand old species O. crispum and O. Pescatorei. These two most useful decorative plants can now be procured so cheaply, and grown so easily, under similar treatment to that mentioned above, that it is a wonder that they are not grown as plentifully as, say, carnations, in gardens where cut flowers are much in demand. CLYTIE.

BROCCOLI SUTTON'S WINTER MAMMOTH.
A fine winter variety raised and distributed by Messrs. Sutton and Sons, Reading.

DEEP CULTIVATION.

In further reply to Mr. Molyneux's remarks on this important question, page 34, for January 14, I am indeed glad to know that on many points so practical a man as he is and I are agreed. In the first place, I should like to make it quite clear that my advice on trenching entirely referred to vegetable culture, and I have never, to my recollection, advocated the same operations for fruit trees and roses, for the important reason, viz., that whereas the latter two generally remain on the site where planted for many years, in direct opposition the large majority of vegetables are grown and treated as annuals. Consequently the ground requires to be prepared for the same each year.

Mr. Molyneux says the more we discuss the method of trenching the more we shall learn of other people's ideas, and that he is writing for the information of beginners who have had no previous experience. Well, I do not object to this in the least, but whether beginners or not, my advice applies to all, and I say the smaller the garden the more necessary it is to obtain the depth of soil required as speedily as possible, and lose no time in bringing the subsoil into a fertile condition. As in the case of small gardens generally, to meet the requirements the land is invariably overtaxed, and to counteract this trenching should be performed, as far as possible, annually, which means that one practically obtains a fresh soil, which requires less manure, and gives unquestionably a much larger yield.

The advantages that Mr. Molyneux suggets from trenching are quite right, so far as they go, but the principal and main object of having at command a good depth of soil is, that by carrying out a system of trenching annually a fresh and sweet compost is assured, in which the majority of crops will revel. I am fully alive to the fact, and sympathise with those who are not in a position to carry such work into operation, nevertheless, the fact remains that the system I advocate is the right one, though, of course, I may be wrong; but to me it seems absurd to attempt to deal with a stubborn soil buried two or three feet from the influence of the weather, and other agents. I would much rather fight with my enemy in the open than in ambush.

Few great achievements have ever been accomplished without a certain amount of sacrifice, and if trenching is performed at the right season there will be ample time for the beneficial effects of the weather to do much in bringing even the most ungenial soil into a workable condition before the season arrives for sowing or planting. I am bound to admit, and I hope I have always been sufficiently clear, by not misleading anyone, that the first season does necessitate a certain amount of pluck and care, but once having accomplished this the battle is practically won, and the results will more than justify the course adopted. E. BECKETT.

WEATHER AT ROTHAMSTED IN 1910.

The meteorological records of the Rothamsted Experimental Station, Hertfordshire, for 1910 show that the year was characterised by a great excess of rain, even more than that of the year 1909; in fact, the total amount has been equalled or exceeded only about ten times during the past 58 years. This was greatly owing to the enormous quantity which fell in December, viz., 5.36 inches; only once in December since the year 1853 has the rainfall exceeded this amount, namely, in 1876, when 6 inches were recorded. The number of rainy days were 196, being 24 in excess of the average of the past 57 years, and 12 more than in 1908.

The mean temperature of the year was slightly in excess of the average. The most unseasonably warm months were February, October, and December. The last month of the year was 5.4 degrees warmer than November, and only 3 degrees colder than April.

The bright sunshine was 221 hours deficient for the year, there being but four months which showed an excess compared with the average, and eight months of deficiency. March gave the greatest excess of sunshine, namely 42 hours, and July recorded the largest deficiency, namely, 98 hours. The four months of June to September which make up the usual hay and corn harvests in this country, gave a total deficiency of 203 hours of bright sunshine.

The yearly data shows that the twelve months of 1910 recorded a total rainfall of 32.13 inches, against an average for the previous 57 years, 1853-1909, of slightly over 28 inches, being an excess of a little over 4 inches. Calculating these figures up to the acre, we find that, during the whole year 3,245 tons of water have fallen on each acre of land, which is 406¾ tons of water in excess of the average in this district. The two months of November and December alone gave an excess of rainfall of 445½ tons of water per acre.

The mean temperature, that is the mean of the maximum and minimum temperatures, of each day throughout the year was 48.5 degrees, which is 0.6 degree in excess of the previous 32 years. There were eight months of excess and four months of deficiency, the coldest month of the year being November, which recorded but 37.5 degrees, or 5.1 degrees below normal.

The total of bright sunshine for the year, taken by means of a Campbell-Stokes recorder, was 1,387 hours, against an average of 1,608 hours, showing a deficiency of 221 hours.

The last two months of the year having given an excess of 4.41 inches of rain shows us that our underground water supply is 99,689 gallons of water in excess of the normal quantity on each acre of land in this district.

THE TOPIARY WALK AT MONTACUTE HOUSE.
The residence of W. R. Philips, Esq., Ilminster.

TOPIARY WALK AT MONTACUTE.

The shelter that a well-grown and closely-clipped hedge affords is very welcome, especially during winter and early spring, and such shelters are becoming more and more the rule in gardens now that gardens are being cultivated, used and loved as never before. If the hedge is recessed, buttressed, or carved into other shape than that of a simple wall, an added interest is given, and nothing is lost in the matter of shelter; indeed, a seat may be placed in such recess, and here one may sit in the brighter and warmer days of winter. Where closely clipped hedges run parallel and near each other, the intervening walk provides a pleasant promenade at a time when the wind sweeps coldly across the rest of the garden. Such walks should be planned near the house, though some may well be further away if a dry path leads thereto, and should be so arranged that the coldest and prevailing winds do not sweep down them. If the position is very favourable, a cosy circular or square plot may well occur at the end, or in the centre, of such a walk, and here, away from the wind, with dry stone or brick paving, comfortable and substantial seats, an old sun-dial in the middle and a few quaintly clipped trees around, an hour or two may often be spent pleasantly and in comfort even during the long winter season. All this applies particularly to the southern and western counties, but is equally applicable to the northern counties, except that there the opportunities for enjoying such walks and cosy spots are not so frequent in winter as they are further south. At Montacute House, Ilminster, in Somersetshire, the residence of William R. Philips, Esq., the value of a sheltering topiary walk is understood, and in the present issue an illustration of one end of the walk is given.

K.

TSUGA YUNNANENSIS.

The discovery of this species of tsuga in Yunnan has added another hemlock spruce to our gardens, which is likely to be quite as hardy as the Japanese T. Sieboldi, though it may not thrive in places where the Canadian hemlock spruce would be a success. The species was first described by Franchet in the "Journal de Botanique," 1891, p. 258, from specimens collected by Father Delavay in Yunnan. By Delavay and other collectors it has been met with at an altitude of from 3,000 to nearly 9,000 feet, consequently its hardiness ought to be assured. Seeds were sent home by Mr. E. H. Wilson when collecting in Hupeh, and strong plants have been raised at Coombe Wood. To a casual observer the tree bears a strong resemblance to T. Sieboldi, but the cones are larger than in that species. The branches are spreading, and clothed with small, entire, sessile leaves with slightly revolute margins. The upper surface is channelled, and the under-surface glaucous; the apex is very slightly notched. As is the case with the other Asiatic tsugas this one is likely to form an ornamental bush or small tree, and will be valuable for planting as a change from the yew, the foliage being of a less sombre hue.

W.

LATE PLANTING OF FRUIT TREES.

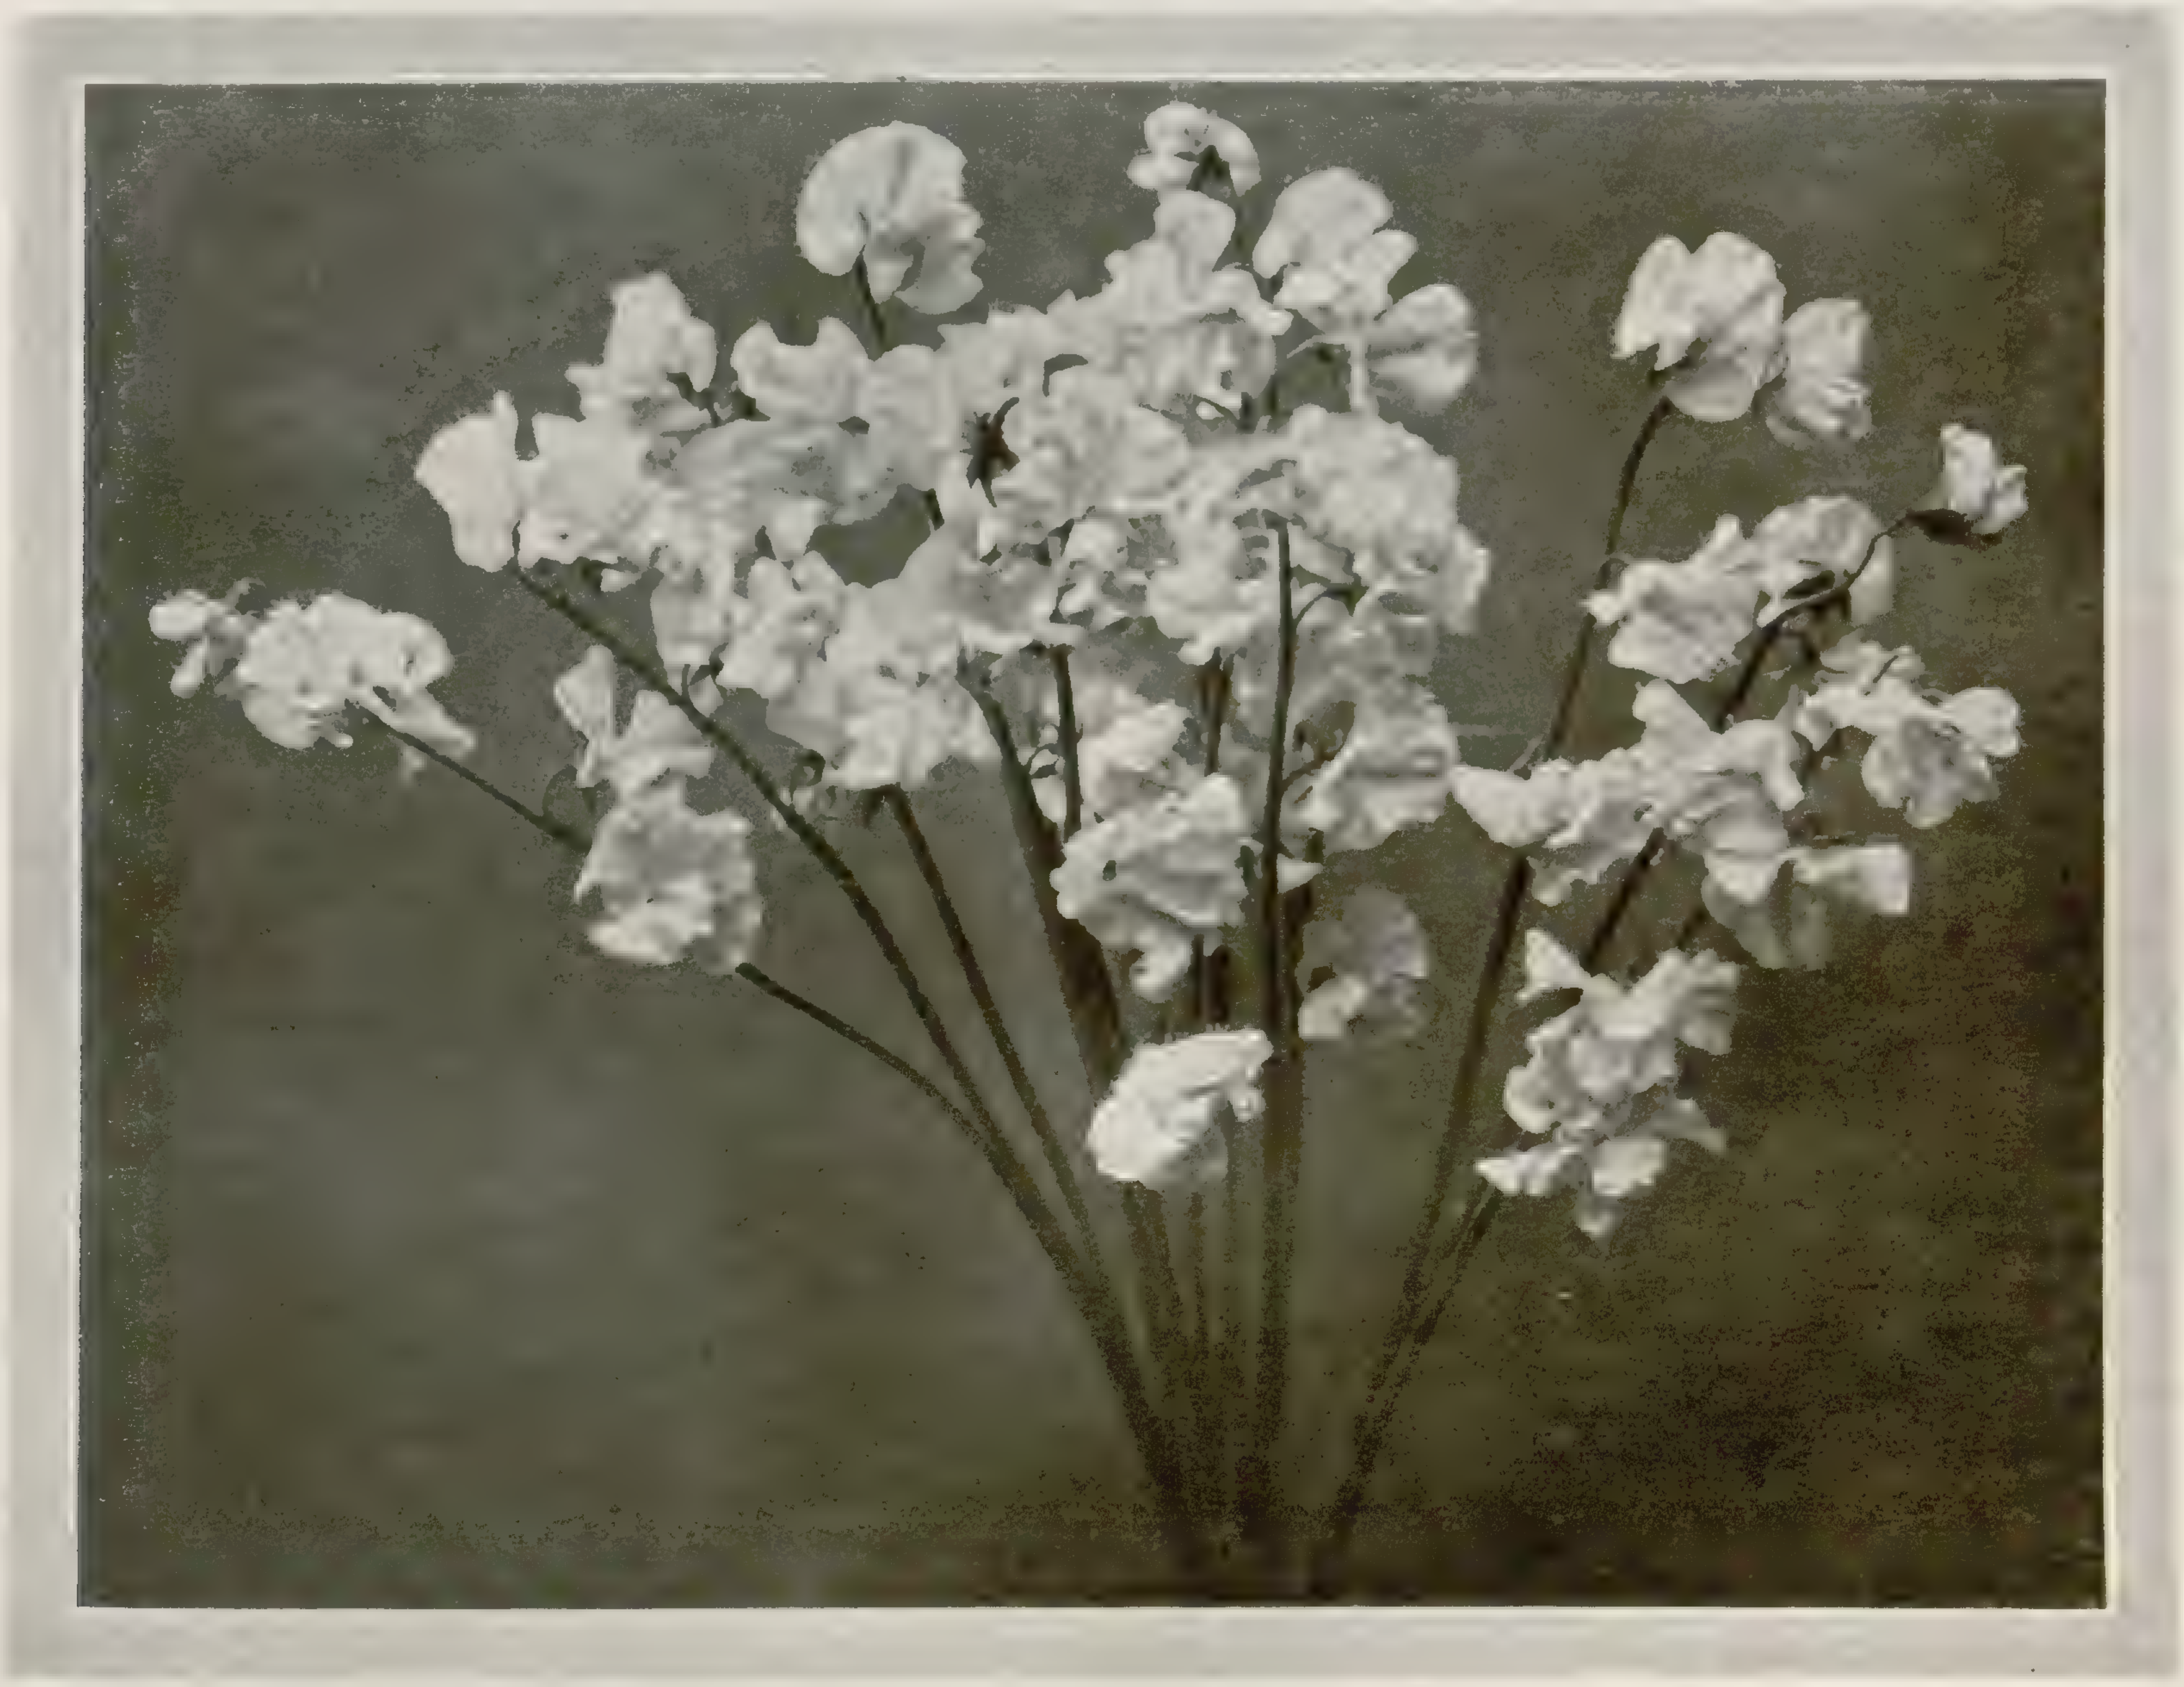
The condition of the weather during the best time for the planting of fruit trees was this season so unfavourable for undertaking these operations, that especially in cases where the soil is heavy, they have been unavoidably delayed, and trees received for the purpose of planting are doubtless, in many instances, as is the case here, laid in to await a suitable planting time. It is, in all cases, best to plant trees as early as is practicable in the planting season, not only because by so doing they are given the best opportunity of making in their new surroundings, before winter sets in, fresh root growth, and by this means they more readily recover from the check occasioned by the operation, but moreover, it is often found difficult, owing to wet or frosty weather, particularly in heavy land, to have, late in the season, a good opportunity of proceeding with the work.

We have before now in wet seasons, surmounted difficulties in planting by making use of specially-prepared soils, and have in this way avoided putting the soil in a pasty condition about the roots, and have thus met with satisfactory results. But according to experiments carried out at Woburn, painstaking in this direction, is, after all, quite unnecessary. Notwithstanding this, and the fact that I have been informed by a practical nursery hand that he has often seen excellent results follow the planting in very wet and pasty soils, I should hesitate before planting trees in our heavy tenacious soils when they are wet and stick. It ought, however, to be remarked that we have no practical proof that, were we to plant under these conditions, they would lead to failure.

Late-planted trees naturally suffer more readily from summer drought than do others, and consequently require extra attention in the way of mulching, watering, and spraying overhead in the evening of hot or dry windy days. Attention to details of management of this description may make all the difference with regard to success and failure, between which there often remains but a very narrow margin. Benefits may likewise be derived from shading the stems, and for this purpose we have sometimes, more particularly in the case of standards, used hay bands, and sections of the bark of larch poles. This calls to mind that I saw many years ago—it must be nearly half a century—either in Hyde Park or the Green Park—large forest trees that had then been recently transplanted, with their trunks and large branches bandaged with hay bands, for the evident purpose of arresting transpiration, and under similar circumstances we have here adopted this plan with evident advantage.

All newly-transplanted trees are the better for having their shoots shortened back when their buds commence to swell, though there was a time when I did not consider pruning trees in the season they were planted an important matter. Further experience has, however, convinced me of the utility of the practice. I have more especially observed its benefits in the case of peaches growing under glass, and if this practice is beneficial in the case of early-planted trees, it is particularly so to those moved late in the season.

T. COOMBER.



SWEET PEA MRS. HENRY BELL.
A beautiful cream-pink variety, as exhibited by Mr. E. A. Broad, Par, Cornwall.

SWEET PEA MRS. HENRY BELL.

This delightful sweet pea belongs to the cream-pink section, and is not only a good variety for exhibition purposes, but is excellent for garden decoration. It was awarded a First Class Certificate by the National Sweet Pea Society in 1908, and was sent out that year by Mr. Robert Bolton, of Warton, Carnforth. The flowers are of good size and finely-waved; the ground colour is creamy, and over this is laid a beautiful rich apricot-pink shade that makes the dainty blossoms very attractive and effective. The accompanying illustration represents a very fine vase of the variety exhibited by Mr. E. A. Broad (gardener, Mr. W. H. Prophet), Par Station, Cornwall, at the exhibition of the National Sweet Pea Society held in July last. The class was for two bunches of waved sweet peas, and Mr. Broad won first prize with Mrs. Henry Bell and Constance Oliver.

The National Rose Society.—At the annual meeting of this popular society there was a divided opinion as to how even a portion of the handsome balance should be spent. I would like to offer a suggestion—a moderate one, too, in point of cash value—and it is that the society improves the ground floor of their show tents so that visitors can inspect with comfort the charming exhibits got together without wading through mud and water, as they have had to do on some occasions at the July show. Surely this could easily be managed, and at a small cost, but with much comfort to the visitors, especially the ladies.—A VISITOR.

THE OLD FARM ORCHARD.

It does not count for much in the world of commercial fruit culture, and very often the old orchards which are attached to dozens of farmsteads in the West Country are held up as objects of scorn and adverse criticism. Unfortunately, many of them deserve it; they are illustrations of what one ought not to do in fruit growing, and neglect is written on every moss-covered tree in the orchard. In the heavy gale which swept over the land a few days before Christmas many an old orchard tree was laid flat on the ground, and while in some cases they will remain where they dropped for many a long day to come, in others they have been sawn up for firewood, but wherever the wind played havoc there is a gap, and one tree the less. Shall another be put in to fill up the vacancy? Perhaps if the farmer put the question to certain experts in the fruit world they would say no, and point to the necessity of planting young trees on fresh land.

If, of course, it were a question of planting a new orchard entirely one would hold them to be right, but it is highly important that the old orchards should not be allowed to drop out, because, in most cases, they are just in the right places for them. When the farmers who are now sleeping in West Country churchyards planted orchards for the prime object of filling cider casks, they did not go a mile away from the homestead to select a site. Not a bit of it: they wanted the orchard close to home. You go into it out of the rickyard, it is a handy place for the poultry, for the ewes and lambs in the spring, for young calves to take their daily exercise, and for the old sow to wander with her young. And all this, by the way, is beneficial for the orchard, because the trees are manured when they are close to the homestead, whereas they get none if they are a distance away, and the contrasts of orchards under these varying conditions proves the point.

We may take it then that the site selected by the original planter is as convenient for the present occupier of the farm as it was for his predecessor; and as the man who planted bestowed a benefit on his successors it is the duty of the farmer and the landlord, jointly, to keep the orchard for present value, and for the sake of those who shall come after. Do they all realise this responsibility? Alas, no. One hears of landlords who are content to see the orchards on their estates become derelict, and will not supply the material for filling them up. What a mistaken policy when one considers that a good orchard is worth fifty pounds an acre or more than the same land would be without the trees. Just so, but the upkeep of an orchard is a dual responsibility shared by landlords and tenants, and in not a few cases it is the latter who are at fault. The story of landlords spending money on trees which farmers have never taken the trouble to look after, and they have died, is only too true, and an orchard can never flourish unless it has the interest of the two parties concerned in it.

But the tale of orchards is not entirely one of neglect of responsibility on part of either landlord or tenant, or both, for in the West Country there are landowners who are proud of the orchards on their estates, as they have good reasons to be, and there are farmers who are also fruit growers that take a delight in their trees.

Let me illustrate a case. It matters not where the farm is situated, nor who it belongs to, and it may suffice to say that it is in a locality where the farms are mostly small, but every one has an orchard attached, everybody grows fruit, everybody makes cider, and most of the members of the local fraternity drink it, some of them after the manner of their fathers, even for breakfast.

Would I come and have a look at his orchard? The invitation came from a farmer who has lived more than half a century, and it was enough to suggest that he, at any rate, took an interest in it, but I learnt to my satisfaction later that he loved it, and one reason for his affection, so he told me, was that no similar area on the farm had paid him anything like his five-acre orchard. We entered the enclosure by way of the stackyard, and before me I beheld what appeared to be a mixed medley of trees, so far as sizes and ages were concerned, but orderly nevertheless, and symmetrical in the rows, just as they were originally planted. As we walked amongst the trees and talked I soon began to realise how much sentiment there was attached to the old orchard, for the man informed me that he was born in the farmhouse on the other side of the stackyard; the holding had been in the occupation of his family for considerably more than a century, and the orchard was originally planted by his grandfather. "There were none of the new-fashioned sorts in those days," said the farmer. "Look, my father grew him from a pip," and he pointed to a big spreading specimen with the dimensions of a forest tree. What was the name of it? Well, he didn't know. They always called them redstreaks, because the apples were striped with red, and though it wasn't a great deal to look at, many a hogshead of cider had been made from that tree. But all the old trees did not possess the vitality of the vigorous specimen referred to, and a few looked as if they had done their life's work. Perhaps they had, the farmer said, but one was a wonderful nice apple to eat when all the others were finished, and he didn't know where he could get another like it, and, besides, it was one the old Dad planted, and he didn't like to do away with it so long as it lived and brought a few apples every other season.

These, however, were the exceptions, and one could see many more years of usefulness in the row of big old trees of Blenheim Pippin, which ran along the end of the orchard, but the lament of the farmer was that "Blemons" didn't come so fine as they used to do, and he went on to recall the size and weight of some notable specimens that the trees had produced in the past. It was easy to observe, however, that he had a great affection for the Blenheim, and, as he put it, he must have a nice apple or two to eat and give to a friend who might come along, and everybody liked a "Blemon."

"Ah! but that Bramley's Seedling is the apple for an orchard," said the farmer, and he went on to tell how a man had brought some into those parts a good many years ago, and he managed to get a few grafts, which he put on a tree, the fruit of which you could neither eat, cook, sell, nor make cider of, and he chose this stock because it was both old and useless. According to my friend's version however, it was the best hit he had ever made in the fruit line, for that old stock is now a splendid tree, which has borne bushels of fine fruit, and specimens of Merryweather's apple of different ages showed how the variety had been chosen before others, not only for grafting, but also for planting in between for filling up vacancies where old trees had dropped out.

"What you want for an orchard," said the man, with the evidence of conviction, "is a sort as 'ull not only bring good fruit, but will grow and make a fine tree, and Bramley 'ull do both. If I'd got five acres of good land close to home, and my own property, I'd plant it with Bramley's tomorrow. Talk about orchards not paying, they'll pay right enough if you look after 'em, and grow the right sorts of fruit."

I broached the subject of pruning, and the farmer waxed eloquent again. He did his own pruning, and the reason was that he engaged a local expert to prune some old trees once that were, as he thought, too thick, and, thinking the professional man knew more about it, he left the job to him, but the man cut the trees about so severely that they were years before they recovered and bore a crop. The instance taught its lesson, however, that the best thing to do is to use old trees gently in the matter of pruning, and to bring up young ones so that when they get old they never want a waggon-load of stuff cutting out of them.

Did space permit I could write a good deal more about this old farm orchard and the man who cares for it, but to me it was an excellent object-lesson, for, in the first place, it was old and contained some trees that were originally planted in it. There were others planted or grafted on existing stocks years later, and now in full bearing, others put in more recently still and becoming established, and others again only planted this season. Will that orchard grow old? Not a bit of it. Need any orchard become derelict, as many unfortunately are? No, because trees do not all drop out at once; the process of degeneration is slow, and if steps are taken to fill up gaps as they occur, if the trees are properly manured and cared for, by the time the oldest drop out others planted since have come into a good state of bearing. Thus the old orchard is made young again, as in the instance described, and as I shook hands with him over the gate the farmer said, "I'm fond of the old orchard, and hope the lads will take care of it when I'm gone."

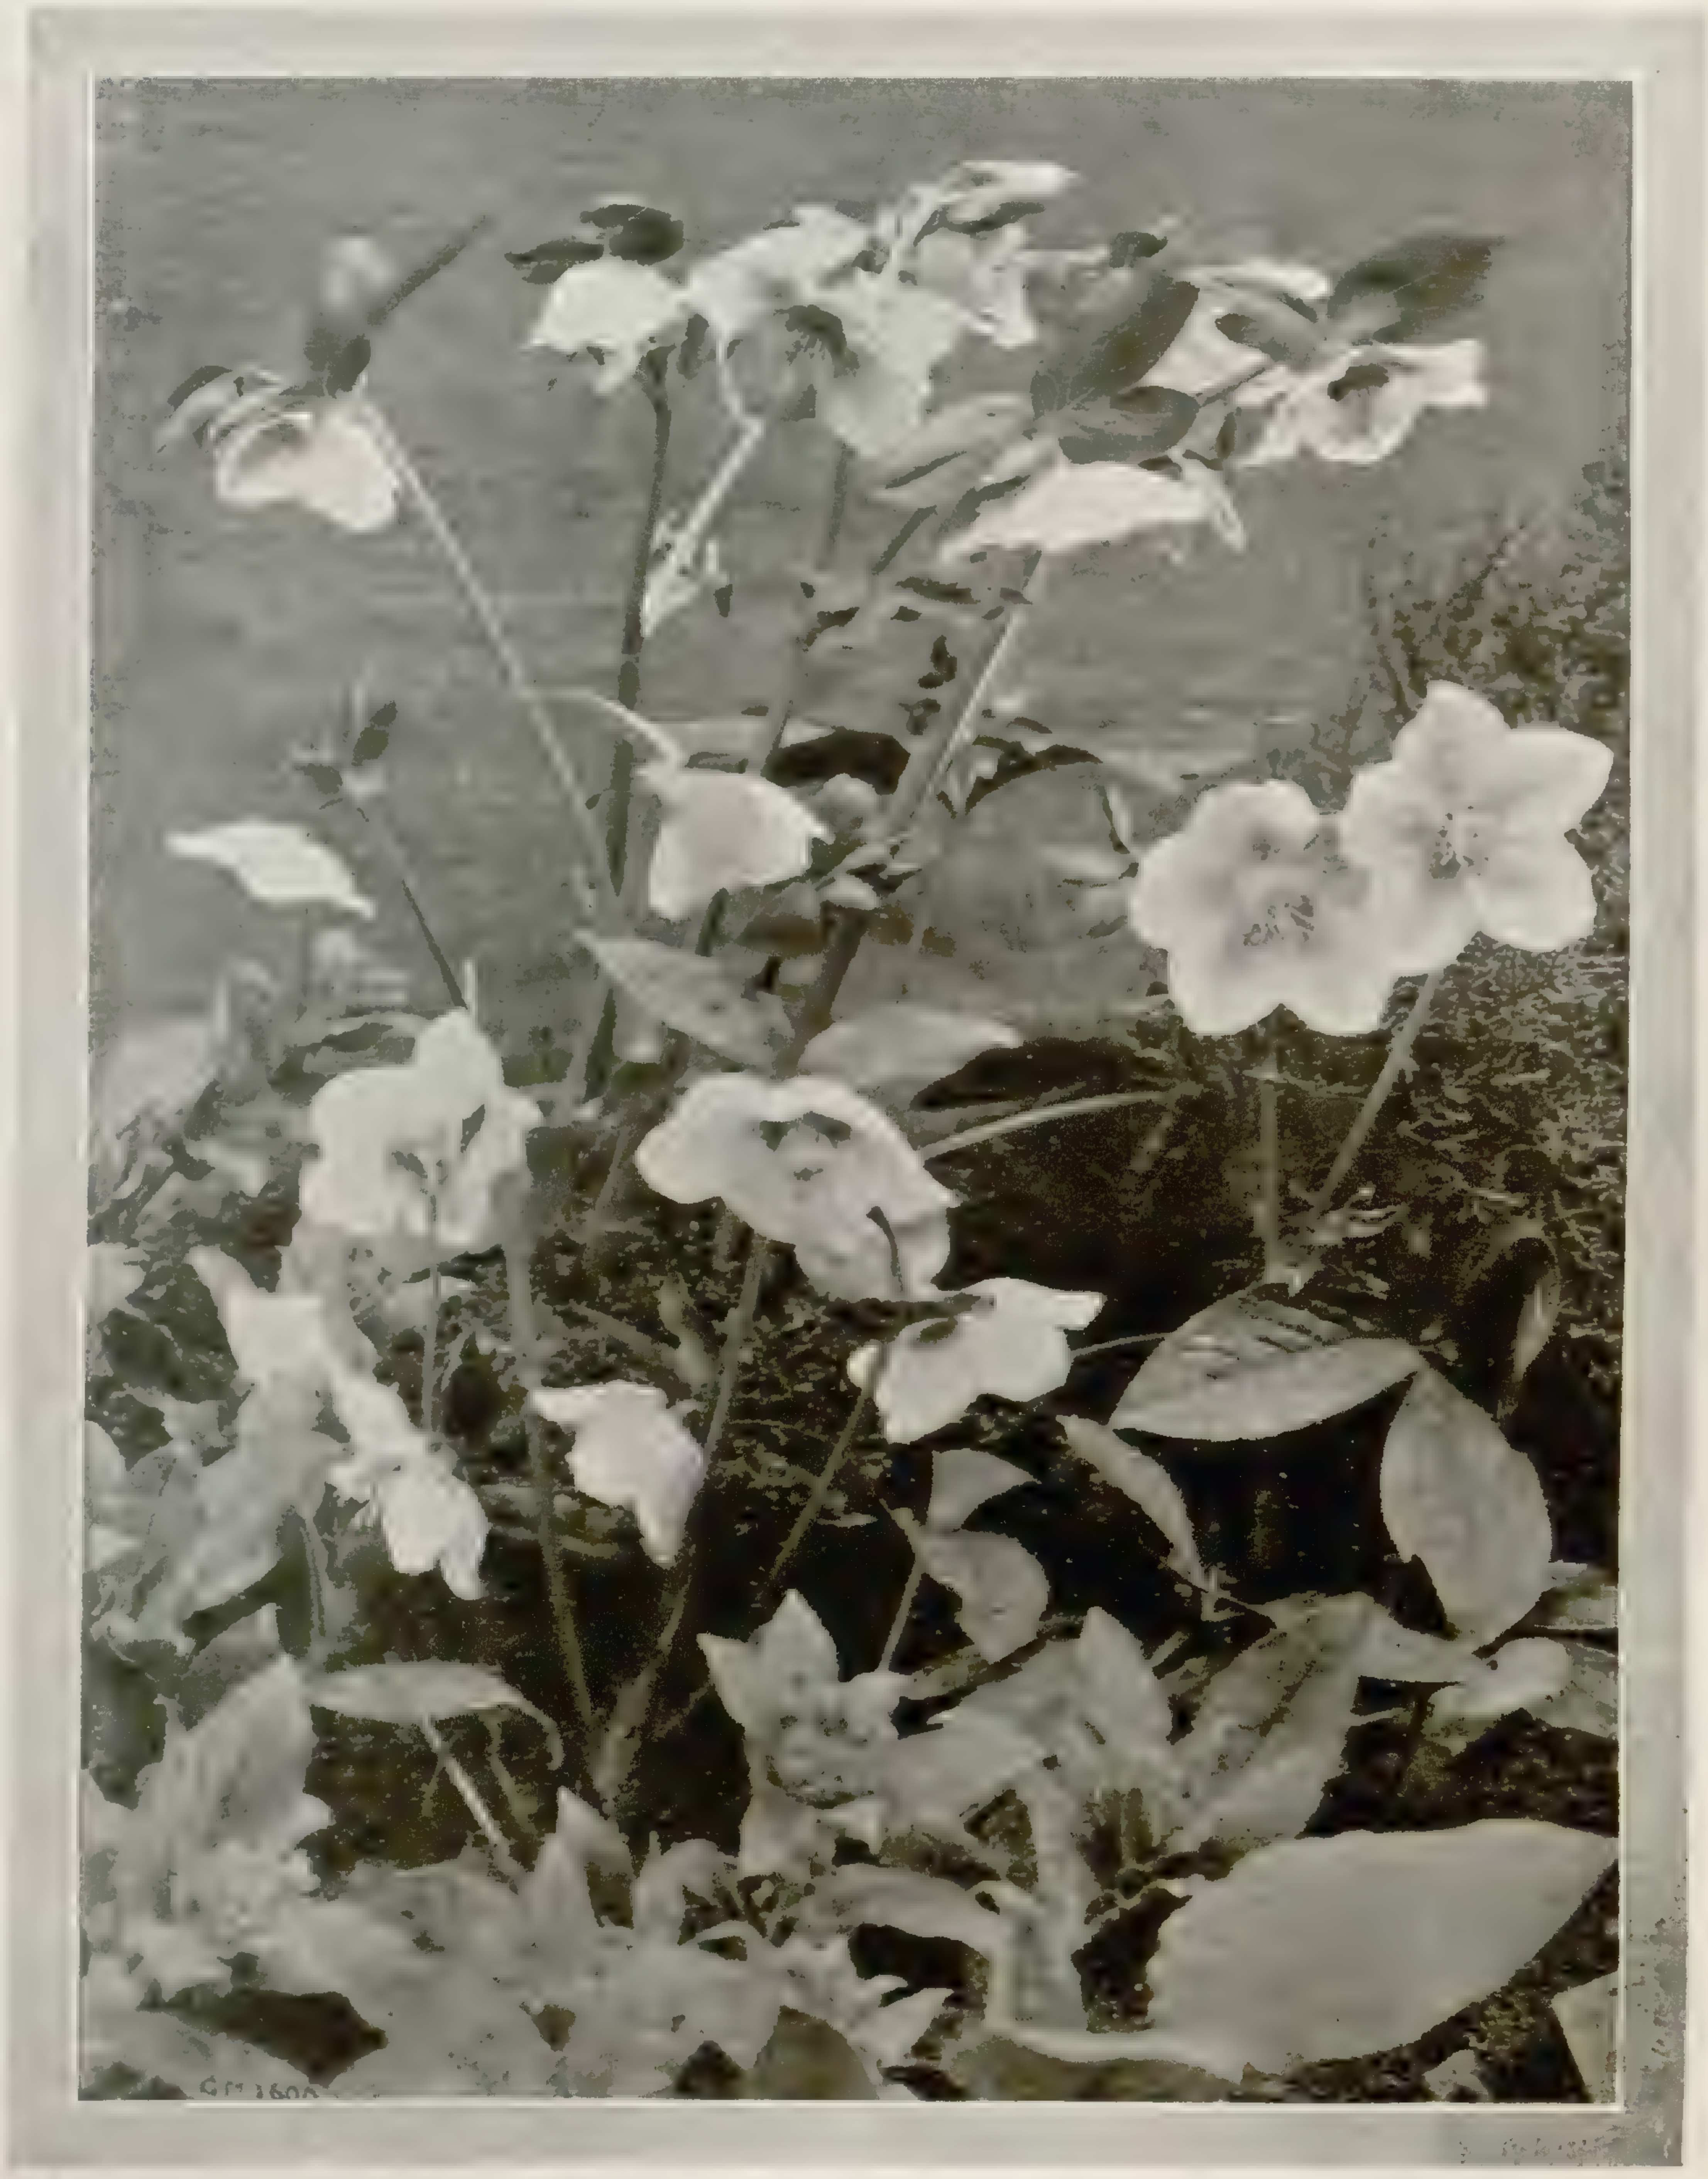
H.

THE COMMON CORAL TREE.

The Common Coral Tree (Erythrina crista-galli) is one of the best known of the many beautiful plants that have a place in the gardens of this country, but we venture to suggest that but few of those who are well acquainted with it have seen a specimen that would compare with the magnificent example that is represented in a photograph that was sent us by Mr. Rundle some time since, but which unfortunately is not suitable for reproduction. The photograph shows the remarkable proportions of the specimen, but the finely-developed flower spikes are not sufficiently clear to admit of their having justice done them in process of engraving. This fine example has a place in the gardens of Bosahan, the Cornish seat of Sir A. P. Vivian, C.B., and is of interest as evidence of the remarkable development of plants from temperate regions in this favoured county, and the high character of the cultural skill that obtains in the interesting and beautiful gardens of Bosahan. As we look at the photograph of the specimen, and admire its immense proportions, it is not difficult to understand that the position it occupies is warm and sheltered, and that Mr. Rundle, the head gardener, is careful to keep the soil about its roots in a fertile condition by the use of rich top dressings when necessary. The books tell us that this erythrina ranges from six to eight feet in height, and this is true enough of specimens usually met with in gardens in counties less favoured than Cornwall, but, as is so readily seen, the Bosahan specimen greatly exceeds the maximum height given.

HELLEBORUS GUTTATUS.

There is some difference of opinion as to whether the Lenten Rose, so frequently referred to as Helleborus guttatus should be regarded as a species or a variety. At Kew it is regarded as a species, but in other directions it is considered to be a variety of H. orientalis, with H. subpunctatus as a sub-variety. It is very distinct from H. orientalis proper, and is a very beautiful and early blooming plant, the flowers opening out of doors in January and February in favourable localities and seasons. As in the case of most Lenten Roses, the blooms last a long time, and are very charming when cut and placed in small specimen glasses. The flowers of H. guttatus are about two inches broad, white, spotted and speckled with purple, and one stem will carry from two to seven flowers. As it is so free flowering a few plants by a sheltered woodland walk, or in a favourable and moist part of the rock garden, will form a pleasing and attractive feature during the first three months of the year. The present illustration represents a plant exhibited by Messrs. T. S. Ware, Lim., Feltham, at the meeting of the Royal Horticultural Society held on January 17. A good deal of work is in progress among hellebores, and many growers, amateurs and traders, are doing their best to improve these winter flowers by cross-fertilisation, hybridisation, and selection, so that before long we may expect finer flowers, greater freedom, and a wider range of colouring.



HELLEBORUS GUTTATUS.
A fine Hellebore, with white, purple-spotted flowers; as exhibited recently by Messrs. T. S. Ware, Lim., Feltham.

EVERGREEN SHRUBS FOR WALLS.

We are reminded at this season of the value of evergreen shrubs for clothing house walls, etc. It is true that many of the more beautiful subjects available for clothing walls are deciduous and innocent of leaves during the dull season, and this leads me to say that, if evergreens were interspersed with deciduous subjects, matters would be improved, and, at any rate, a partially furnished appearance would be ensured the year through.

In favoured parts of the country camellias not only do duty on the house walls, but are employed in sheltered spots in the shrubbery, and good examples may be seen in the Royal Gardens, Kew. The ordinary form, or type plant, C. japonica, is perhaps the best for our purpose, and its ample and glossy leaves have a cheery appearance. It must be given a position on a south wall.

A splendid subject is seen in Magnolia grandiflora, and, apart from the immense pure white and fragrant blossoms, the foliage is of a noble character. When established against a south wall it grows with great freedom, and is capable of covering a very large space in the course of a few years. It cannot be expected to flower satisfactorily unless fairly rich soil is provided, together with annual dressings of manure, and an occasional dose of nitrate of soda from early summer onwards. This plant is sold in pots, and so can be planted in permanent quarters at all seasons with safety. Early spring is the best time as being the season of renewed activity. The plants become established at once. The Fire Thorn, Cratægus (Pyracantha) Lelandi has become widely distributed, and fine examples are seen covering house walls all over the country.

Having in mind the old adage, "Good wine needs no bush," we pass on to notice the more refined and handsome amongst the ivies. Amateurs generally fail to take advantage of the exceeding beauty that is to be found in this family of plants, but, on the other hand, employ the coarse kinds to furnish the wall surface. Hedera madeiriensis variegata is the finest of all variegated forms, and is exceedingly effective. H. palmata aurea has bright yellow leaves, which are edged with green. H. argentea rubra, green, edged with red and white, is very attractive, as is also H. Cavendishi, with distinct silver foliage. H. albo-lutescens, white and yellow, Cripps, green, margined white; Palmata aurea, yellow, edged green; H. canariensis aurea maculata, blotched and streaked yellow; and H. spectralis aurea are a good selection. Ivies are invariably supplied in pots by nurserymen, and care must be taken that the ball of soil is not broken in planting them in permanent quarters. I noted a wall in the public gardens at Guildford some years ago, which contained a number of the choicest kinds, about 2ft. of space being allotted to each, and it proved both an interesting and beautiful feature.

Splendid examples of the Common Myrtle (Myrtus communis) are seen, both in bush form and against house walls in the West of England, and great is the pity that it is not employed upon a more extensive scale in this way, or at least as a wall shrub, in the South of England and the Midlands. Protection could easily be given during severe periods by means of large branches of coarse evergreens, such as the laurel, and while reed and other mats are available, their presence is not to be desired in the dressed portion of the garden. Garrya elliptica clamours for mention and attention, being distinctly ornamental by reason of its deep green leaves and long pendulous catkins, which are freely produced in the early part of the season. Experiments have gone to show and prove that this Californian shrub is sufficiently hardy to come through our winters practically unscathed over the greater part of this country, provided it is given a sheltered position in the shrubbery, or, again, as a wall subject. It is superfluous to dwell upon the merits of Cotoneaster microphylla and other species for the purpose indicated, and it must suffice to say that they contribute in liberal fashion to render the garden bright and attractive when winter is upon us.

Walter H. Aggett.

NOTES FROM SCOTLAND.

◆

The Past Year: A Retrospect.

With the advent of the New Year a turning point in the life and environment of the ardent horticulturist appears to have been passed, as with renewed hope and ambition the individual blessed with good health and a fairly comfortable sphere of duties, can afford to view with a large degree of complacency the petty annoyances and disappointments that, as a cultivator, are almost sure to beset his pathway in due course; and even were it possible to forecast these at the present time it would in most cases be useless to brood over them.

The weather of the past year has been largely commented on in the horticultural press, and other papers, and unfavourably generally. Judging mainly from these sources of what has taken place elsewhere, one would be inclined to think that Scotland, but more particularly the southern and extreme northern districts, had enjoyed comparative immunity from the excess of rainfall and gloomy skies that have so generally prevailed. Apart from this, however, the rainfall here, in the south-west of the country, was approximately the average of previous years, viz., 43 inches; the wettest month being August with 6.50 inches, upon which the totals for November and December approached very closely. The total amount of bright sunshine I am unable to give, as this is not recorded here; but, referring to memory and close observation of the weather for the past thirty years, there have been but very few more genial, and generally propitious for the horticulturist and the various subjects under his charge, than the one just closed.

The Hardy Fruit Crops.

The scarcity of these, but more especially of the larger kinds—apples, pears, and plums, so much deplored throughout the country, finds no echo in this part, as for several years past the crops of the two first-named have not been equalled for bulk; while, owing to the favourable weather that prevailed during the greater part of September and October, whereby thorough maturity of the fruit was assured, the respective varieties have ripened in good succession. Those still undergoing the process give promise of being equally satisfactory in this respect, thus ensuring an ample supply for all necessary purposes until the spring is far advanced. Owing partly to this cause, such high-flavoured, but somewhat unreliable varieties as Blenheim, Ribston, and Cox's Orange Pippins are much superior, both in quality and appearance, than is generally the case with open-air produce in northern gardens. The same remark applies equally to pears, which were fairly plentiful and good, and the later sorts have ripened well, and the very latest, as Easter Beurre, Beurre Rance, and a few other well-known and generally cultivated sorts appear to be following upon the same satisfactory lines. Medlars are not much grown in Scotland owing probably to their uncertainty in fruiting, and the lateness at which the fruit is developed, thus often rendering it useless for dessert. Last year the fruit remained upon the trees until the early part of November, and being then gathered and stored made several quaint but highly-appreciated dishes of fruit at Christmastide.

Green Vegetables and Root Crops.

It may be readily surmised that atmospheric conditions proving so beneficial to the foregoing crops would exercise a like influence upon the humbler, but not less necessary, vegetable products. In respect to this, it is correct to say that the supply of many kinds was abundant and good in quality. The absence of severe frost enabled the late-planted cauliflowers to continue growth almost unchecked, and small but useful heads were available to the end of the year, which, together with broccoli, made daily supplies of these much-prized vegetables possible. Brussels sprouts, celery, and all kinds of root crops, as well as the various green and the blanched forms of salading, made excellent growth until late in the season, so that supplies of this kind are plentiful and will continue so for some time to come.

The mild moist weather of the past two months, while favouring growth and enabling good progress to be made with certain kinds of work, has been inimical to working the soil, and with the season for sowing and planting rapidly approaching a change to drier and more bracing conditions is now much desired. James Day.

SOME INTERESTING CONIFERS.—I.

In the ensuing notes attention is directed to a few interesting and showy conifers which are worth special attention on the part of cultivators.

Ginkgo biloba.

This, the Salisburia, or Maidenhair Tree of some gardens, forms one of the choicest trees we possess, and one of the most distinct. Mature trees are of decidedly ornamental outline, though young examples are inclined to run up slender, with a meagre branch system. With age branches become more numerous, and trees 50 to 80 feet high offer a pleasing aspect. It may be easily distinguished from other trees by reason of its green fan-like leaves, resembling gigantic pinnules of a maidenhair fern. As it is diœcious, fruits are rarely seen in British gardens. Here and there, however, they are borne. They are not like those of other conifers, but resemble a small yellow plum, with moderately thick flesh, and a stone half an inch, or thereabouts across. In China and Japan these fruits are an esteemed article of food, being eaten both raw and roasted. The tree thrives best in good, but comparatively light soil, which may either be of a loamy or a peaty character. The species is said to have been first introduced to this country about 1754. Several varieties are known, but they are of less value than the type. It is increased by means of imported seeds, which germinate readily.

Cephalotaxus Fortunei.

Several species of cephalotaxus are known, but as they are very similar in many respects it is not worth while growing more than one species except where scientific collections of trees and shrubs are encouraged. The different kinds are yew-like in character, but the leaves are very much larger than those of any yew. C. Fortunei is a native of North China, from whence it was introduced by Mr. Fortune about sixty-two years ago. Under cultivation it grows into a large bush, eight feet or more high, and as far through, well clothed with branches from the base. The leaves are 2½ to 3½ inches long, acuminate, dark green above and pale beneath, marked with two silver lines. Oval fruits an inch or more long are borne; they are made up of a fleshy shell enclosing a brownish nut. It is worth planting instead of the yew in the Southern and Midland counties, but is hardly suitable for very cold places. One of the other species, C. pedunculata, possesses a curious variety of fastigiate habit called fastigiata. It does not grow very tall, but is of very distinct appearance.

Podocarpus alpina.

This is perhaps the hardiest of the various species of podocarpus, for, though several thrive in Cornwall and other counties with a similar climate, P. alpina is the only one which can be relied on in the neighbourhood of London. It is found at a fairly high elevation in Tasmania, hence its hardy character. Never reaching a great height, it is a suitable bush for growing on a rockery. The branches are slender, and grow in a confused mass, to form a dense bush two to three feet high. The yew-like leaves are small, linear, about half an inch long, and paler in colour than those of the yew. It is perhaps the smallest growing species of the genus, for many of them form timber trees. P. Totara is one of the most important timber trees of New Zealand.

Prumnopitys elegans.

The Messrs. Veitch, of Chelsea, succeeded in introducing this distinct yew-like bush, or small tree, in 1860. It was sent to them from Chili by their collector, Richard Pearce, who was instrumental in sending home the forerunners of the beautiful race of tuberous begonias which is now so popular everywhere. Under natural conditions it is said to attain a height of 50 feet, but under cultivation it appears as a large-sized bush, evenly clothed with branches from base to summit. Its fruits are said to be large, plum-like, and edible, but they are rarely, if ever, produced here. The colour of the leaves is of a much brighter green than that of any variety of yew, hence the value of the species as a substitute for the yew where a bush of less sombre appearance is desired. Cuttings of half-ripe shoots, taken towards the end of July, root readily either in a warm case or cold frame. The bush thrives in lightish loam, and also in peaty soil.

Saxegothæa conspicua.

This is sometimes spoken of as "Prince Albert's yew," on account of its generic name being given in honour of the late Prince Consort. It is a native of Southern Chili and Patagonia, and was introduced in 1849 by William Lobb. Its introduction created a considerable amount of excitement in scientific circles, for it differed from any other known conifer, though it possessed characters which agreed with those of several other genera. Unfortunately, it is not hardy enough to succeed in any but the most favoured parts of the country, for though it exists out of doors in the neighbourhood of London, it makes very slow progress, and looks quite another species when compared with such free-growing examples as those at Strete Raleigh, in Devonshire. On that estate there are two magnificent specimens, upwards of 40 feet high, clothed to the ground with branches. The trees are of free and graceful outline, and though the leaves are yew-like in shape, they are relieved from the depressing effect of those of that tree by silvery lines on the under surface. The Strete Raleigh trees are reputed to be two of the earliest introductions to this country. They flower well each year. Flowering specimens have also been received from a tree growing on Lord Arthur Brown's estate at Westport, in Ireland. Dr. Lindley, in a description of this species, said that it "has the male flowers of the podocarp, the cone of a dammara, the fruit of a juniper, the seed of a dacrydium, and the appearance of a yew." Burpee's
The Leading American Seed Catalog for 1911

"THE SILENT SALESMAN" of the World's Largest Mail-Order Seed Trade tells the *plain truth* about the Best Seeds that can be grown—as proved at our famous FORDHOOK FARMS—the largest Trial Grounds in America. Handsomely bound with covers lithographed in nine colours it shows, with the six coloured plates, Seventeen Choicest Vegetables and most Beautiful New Flowers.

It is a SAFE GUIDE to success in the garden, and should be consulted by every one who plants seeds. It is mailed FREE to all who appreciate QUALITY IN SEEDS. Shall we mail YOU a copy? If so, kindly *name this magazine* and write TO-DAY!

THE KIRKBRIDE NURSERIES.

Away beyond Carlisle, amid the wildly picturesque scenery for which Cumberland is famous, is the quiet, old-world village of Kirkbride. It is from this village that large numbers of the noted Cumberland hams come, and for generations the hardy bordermen round about have earned their living by pig breeding, wild fowling, fruit growing, and other rural pursuits. It is now, however, thirty years or more since the staid inhabitants of this quiet little village witnessed the foundation of a new enterprise in their midst, and we may imagine they looked upon this with astonishment, if not with some contempt. They probably failed to realise that in starting a nursery for the cultivation of alpine and other hardy flowering plants Messrs. Stormonth and Son were laying the foundation of a business that would make their little village known among horticulturists throughout the kingdom. This, however, it has proved, for Messrs. Stormonth have long held a prominent position as specialists of hardy border and rock plants, and now they have added a seed and bulb department to their business, which bids fair in the near future to become equally as important as the nursery itself. It was my privilege awhile since when in the neighbourhood of Carlisle to spend a pleasant hour or so in this interesting nursery, and many were the choice plants for the rockery and the herbaceous border that came under my notice. The nursery is not remarkable for its great extent, but its ten or a dozen acres are exceptionally well stocked, there being no waste space anywhere, and certainly nothing was seen that was not really useful stock. A part of the home nursery is occupied by fruit trees, which bear heavy and profitable crops, but even here it is found possible to utilise the space between the trees by planting judiciously subjects that can best be grown in partial shade. It is very evident as one walks around this nursery that it is under the control of one who thoroughly knows his plants, and indeed a few moments' conversation with Mr. Stormonth reveals the fact that he not only knows but loves plants, and thus it is that everything seems to be accommodated with a position and environment that just suits it.

Near the main entrance is a rockery of fair dimensions on which a varied collection of the best alpines are grown. To begin to name subjects worthy of note that are to be seen at Kirkbride would mean to compile a catalogue, and as Messrs. Stormonth publish a capital catalogue of the plants they grow there is no necessity for me to say more than that whatever rock or bog plant one may require, be it saxifrage, primula, campanula, hardy orchid, or anything else that is in general commerce, I should be much surprised if it could not be procured from Kirkbride. In an open field close by the home nursery the bulk of the border perennials are grown, and here one finds capital collections of phloxes, irises, pæonies, and the host of effective and useful subjects associated with herbaceous borders. The stock of seedling liliums particularly interested me, for included in it are many varieties that are at once distinct and beautiful. Another particularly fine group of plants is that formed by the hybrid gerberas, the strain here embracing most enchanting shades of colour.

The seed and bulb department, as already stated, is of recent introduction, but, judging by the activity in the warehouse when I looked in, it is already a branch of considerable importance. Bulbs for fibre culture, and the bowls and fibre in which to grow them are made a speciality of, and many uncommon tuberous-rooted subjects for both outdoor and indoor culture are handled. The special line adopted with seeds is to supply all kinds in penny packets, not the penny packets of the old type, illuminated with wondrous-coloured representations of nasturtiums, marigolds, and the like, but packets containing seeds of useful subjects, warranted as to quality, the idea being to place within reach of small growers the means of obtaining a variety of plants at a minimum cost.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM HALSEYANUM.

A large-flowered and attractive hybrid of unknown parentage. The spike carried about a dozen flowers each, white, heavily blotched and spotted with rich brown-purple, the lip showing markings of a more distinctly purple shade. A.M., R.H.S., January 17. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

ODONTOGLOSSUM GODMANI.

This interesting and beautiful hybrid has been produced by crossing O. Edwardi with O. Rolfeæ. It has flowers of medium size, and of a shape that at once suggests the O. Edwardi parentage. In colour they are rich velvety crimson-purple, with yellow crest. A.M., R.H.S., January 17. F. Du Cane Godman, Esq., South Lodge, Horsham.

ODONTOGLOSSUM ROSEFIELDIENSE.

This may be well described as a glorified O. Lambeauianum; its parents are the last-named and O. Harryanum. The flowers are of fair size and beautiful shape, while the colouring is a charming combination of red-purple, creamy-white, and yellow, the last colour being very evident on the labellum. A very fine hybrid. A.M., R.H.S., January 17. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

CYPRIPEDIUM ELIZABETHÆ VAR VOGELSANG.

A magnificent cypripedium, derived from C. Hera Marie and C. Hitchinsæ. The dorsal sepal measures three inches across at its widest, and is white, heavily spotted and blotched with very bright purple, and with a green base. The spreading petals are green and brown, with red-brown shading, and the lip is bright brown. This hybrid was greatly admired for its fine size and colouring. F.C.C., R.H.S., January 14. Mons. Firmin Lambeau, Square Vergote, Brussels.

CYPRIPEDIUM CHARLES SLADDIN.

A very pretty cypripedium, obtained by crossing C. glaucophyllum with C. bellatulum. The neat and shapely flowers are white, freely and delicately veined, and sprinkled with wine-red and rose. On the lip the white ground is almost obliterated by the rich purple spottings. A.M., R.H.S., January 17. Messrs. Sander and Sons, St. Albans.

Hibbertia dentata.—As a climber for a greenhouse of small or moderate dimensions this hibbertia has much to commend it, as the leathery ovate leaves of a bronzy tint, and, when young, with a reddish suffusion, are ornamental at all seasons. Added to this the bright yellow flowers, somewhat suggestive of a hypericum, and about a couple of inches in diameter, are freely borne from the autumn until the spring. There is a second climbing species -H. volubilis, but it does not flower so freely, while the blossoms have an unpleasant smell. All the members of the genus are natives of Australia. —W. T.

Orchard House Trees.—Any trees that require lifting had better be attended to forthwith. Permanent planted trees in borders need lifting about every three years in order to keep down rapid growth made at the expense of fruit. Pears, plums, cherries, apricots, peaches, and nectarines are the usual occupants of this house. When the trees are lifted, and it is found that the soil is nearly used up, procure some fresh loam that has been stacked at least six months; cut this to pieces, and add bone-meal. Cut away any very gross roots and make sure that there are not downward roots, as it is these tap roots that cause the mischief. Well ram the soil as it is added, using about half new soil and half old. When all lifting has been done prune and clean the trees. Open both top and bottom ventilators in order to keep all as cool as possible, until the proper season for starting arrives.—W. A. Cook.

CLEANLINESS OF ORCHARDS

Anyone reading the short article on this subject, page 10, would come to the conclusion, if he had no experience of the various hindrances to successful fruit culture, that it is all plain sailing if the advice there noted is carried out to the letter. If he is the possessor of knowledge gained by experience in the public marketing of his produce he will most likely be not inclined to agree with all that is there written. The whole subject of fruit culture opens up matter for debate, especially as hardly any two authorities agree on many points, and there are very divergent views on winter washing, and all that appertains to cleanliness in orchards.

To illustrate what I mean, a grower of 200 acres of mixed fruit, some few miles from where I write, does not believe in an alkali winter washing at all, but prefers to wash in the spring with lime and salt. Another grower prefers the alkali wash in winter. Another despises grease banding of the trees, while over the next hedge, where some hundreds of acres are under fruit culture, I noted to-day as many as three grease bands on some trees. It is a serious item in material and labour when the trees on 300 acres have to be banded, especially if the bands prove of no value. This same grower for years spurned the idea of its value, but two or three unfavourable seasons set him thinking, with the result that I am satisfied, in his case, the banding is of value.

The writer of the article on page 10 would have us believe that winter spraying will cleanse the trees of American blight. I know, and regret, it is not so, for I have efficiently washed twice during the winter for this pest, painted the affected places during the summer with methylated spirits undiluted, paraffin, and have used gas and Stockholm tar, and yet the trees are still affected. At the same time, I am a strong believer in the use of alkali washings in winter, as I know their value in cleansing the branches from moss and lichen, but that it will clear the trees of American blight and canker I do not agree.

Canker in apple trees is a subject of a most debatable character. Some would have us believe it can be got rid of by pruning the affected parts, covering them with tar, affected parts by means of a powerful painter's lamp, such as employed by them for the removal of old paint from wood previous to repainting. Before we can efficiently apply all or any one of these remedies we must first know the cause of canker. It is all very well for a person to make a broad assertion, and say it is due to mismanagement in not washing the trees winter or summer, wrong pruning, or other cultural defects. What do such critics say about the canker that takes place on the wood made during the current year? It is a common occurrence in some orchards to see, in November, the shoots of that year quite killed by canker, on trees of Cox's Orange Pippin for example. When would spraying have obviated this defect? I firmly believe that a check to root growth by an excess of moisture in an unsuitable subsoil is the primary cause of these attacks of canker in the young shoots, and also in the branches of the trees of such varieties as King of the Pippins, Warner's King, Stirling Castle, and many others that are all too prone to this defect in a cold retentive subsoil, and until the roots are placed in more genial conditions no amount of winter spraying or manipulation of the wounds will eradicate the disease. The easier remedy is to avoid varieties that are well known as prone to canker under such conditions.

E. Molyneux.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

WARM ORCHIDS.

IMPORTED DENDROBIUMS.—At the present season, and during the next two months, the importations of the different deciduous and evergreen dendrobiums arrive. It is really remarkable how many of some of these species annually reach this country, and one wonders what can become of so many plants, yet there is always a demand when they arrive in anything like a satisfactory condition. If the early importations are in good condition, it is desirable to secure plants, as the sunless and all to short summers of recent years must be considered. The sooner the plants start into growth the better chances we afford them of maturing their growth in early autumn. It is a good plan when they first arrive to go carefully over them, cut away any dead or decaying matter about them, and then examine for insect pests when preparing for potting. It is not desirable that the plants should be rushed into growth. It is when they are gradually acclimatised to artificial conditions that the best results are procured. Excessive heat and moisture will have a tendency to develop weakly growth, and should be avoided

POTTING.—When placing the plants in their receptacles only sufficient potting compost should be used to hold them firmly in position; ample drainage must be afforded. No water will be required as the moisture in the atmosphere of the houses will be ample to support the pseudo-bulbs until the new growths arise, after which the necessary encouragement must be afforded. The whole of the dendrobiums enjoy strong light, therefore only sufficient shading is required at any season of the year to prevent the foliage from becoming scorched by the sun.

THE EVERGREEN SPECIES, such as D. thyrsiflorum and its allies, do not commence growing until later. It is advisable that these be potted as soon as possible, and to prevent the leaves falling and the pseudobulbs becoming more or less shrivelled, the plants may be syringed overhead on a fine day; damping between the pots will also be beneficial. —H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PERPETUAL FLOWERING CARNATIONS.—The first batch of cuttings should now be well rooted, and ready for potting. Use small thumb pots, and a very light compost of loam and leaf-soil, with a liberal addition of silver sand. Pot moderately firm, and place them in a house with a temperature of about 55 degrees. After the plants have recovered from the check caused by potting, and have started again into growth, they may be removed into a cooler atmosphere, and placed on a shelf close to the glass to receive all the light possible. Continue to propagate cuttings. The best method is to put a handlight on a stage in a house with a temperature from 55 degrees to 60 degrees; fill in to a depth of three inches or so with silver sand, and make firm. The cuttings may be inserted closely together. After watering through a fine rose place the cover on them, but this should be removed in the evening, and left off all night. Before replacing it on the following morning lightly spray the cuttings. By adopting this method of striking a considerable amount of time and labour is saved than if pots were used.

HIPPEASTRUMS (AMARYLLIS).—A few of the most forward bulbs may now be started into growth; shake some of the old soil away from them, and re-pot firmly, using good fibrous loam, a little peat, leaf-soil, some broken charcoal, and sand. Thoroughly water them in, and place in a temperature of about 60 degrees. Syringe occasionally, but do not give much water until growth has commenced in earnest. If properly cooled off before the flowers expand amaryllis will last a considerable time, and make fine subjects for conservatory and house decoration.

HYDRANGEAS.—In my recent notes there was a slip of the pen. Instead of reading "Hydrangea paniculata" as printed, read "Hydrangea hortensia grandiflora."

GREENHOUSE CALCEOLARIAS.—These should now be brought in from the frames and placed in an airy and light position in a cool house, where they may receive more careful attention. Give them a little artificial manure occasionally, but in applying this be careful not to let it touch the leaves, or they will be injured.

THE CONSERVATORY should now be gay with forced shrubs and bulbs, also primulas in their different varieties, cyclamen, schizanthus, callas and mignonette. Avoid high temperatures by artificial heat, and admit air on all possible occasions. Keep all dead or dying blooms regularly picked off, and renew the plants from time to time, thereby keeping up a fresh appearance. Do not be too liberal in watering.—H. GRUBB, Porter's Park Gardens, Shenley.

HARDY FRUITS.

DIGGING.—Fruit plots should be dug through as soon as all pruning is finished, provided the state of the ground permits, and it is work that requires care if we are to obtain the best results. A very light fork over will be all that is necessary to clean the ground and freshen the soil over the rooting area, otherwise damage may be done to the feeding roots near the surface. A thorough digging of other parts will, through the action of rain, air, and frost, liberate the food, make the soil more fertile, and render good cultivation with the hoe possible through the fruiting season.

MANURES.—It is not advisable to give farmyard manure to apples, pears, or plums that are in a healthy state at this time of the year. If we wait until May or June we shall then know the quantity to give according to the crop, and the trees have then plenty of time to absorb what they require to swell up their fruits to perfection. Then also, the roots will be kept cool during the hot weather by the manure—a very essential point (many gardeners will have noticed that where fruit trees have a partial root run under asphalte walks, brick paving, or other cool situations, they yield the finest fruit), and allow them to carry out their functions to the full in plumping up the flower buds for the following year. Other fruits, such as gooseberries, black currants, loganberries, blackberries, etc., would benefit by a very liberal dressing at any time it is convenient to give it, as, according to the previous year's growth, so may we expect the quality and quantity of the following crop.

RASPBERRIES.—This useful and delicious fruit enjoys a good rich heavy soil, but often where the soil is an ideal one the canes look miserably weak, and this is caused chiefly through neglect at planting time. Most of us have a weakness for gathering a little fruit the first year, but this will most assuredly result in a weakness of canes for many years. Any plantations that were newly made in the autumn should now be cut down to within three or four inches of the ground; the plants will then throw up strong growth, and have a fair start in life. Where established plants are suffering through weakness half of the cane should be sacrificed, and if this is followed up for a few years with proper cultivation the plantation may be brought back to a state of health and vigour. Owing to the creeping and surface rooting nature of the raspberry digging of any description should not be attempted. A good mulch of spent hotbed manure or leaf soil should be given at the present time and it will keep most of the weeds under during the summer.

PLUMS.—The pruning of all bush plums should be finished without delay, so that a good lime and soot wash may be applied, as very often at this time of the year, especially if a long duration of snow or frost occurs, house sparrows, finches, or other birds will play havoc with the flower buds. In making this wash use 2lb. of lime to one gallon of water, and well tone down with soot. This I find checks the birds; it also keeps the trees clear from moss or slime, and acts as an excellent fertiliser. Gooseberries and red and white currants would also benefit by this wash for the same purpose, or, as a quicker method, a good dusting of slaked lime and soot may be dusted on by hand any time when the trees are wet, with the prospects of a fine day.—J. WHITTLE, Cheveney Gardens.

THE KITCHEN GARDEN.

MUSHROOMS.—During the next few months this crop is an important one in most gardens, and a considerable amount of attention is required to keep up a daily supply. The preparation of the manure is of the first importance. Collect the droppings frequently before they are wet, and place them in an airy shed, in not too large heaps, or too rapid fermentation will follow. Turn frequently until the manure is thoroughly sweetened, and make up beds in the mushroom house at intervals of about a month. Avoid spawning the beds at a temperature exceeding 90 degrees. At all times a humid atmosphere should be maintained by damping the walls and paths, and a steady temperature of 55 to 60 degrees should be kept up.

SEAKALE.—The earliest crowns, if lifted and planted in boxes holding about three dozen heads, will force readily, and can be placed in strong heat or retarded at will. The mushroom house is generally suitable for forcing this crop in, and weekly introductions of crowns should be made according to demand. Owing to the uncertainty of the weather at this season it is a good plan to have a quantity of crowns lifted from the main quarters and stored in cinder ashes in readiness as required. Keep the strongest thongs, as these can be made into cuttings for plants in due course.

RHUBARB.—Apples being scarce this year rhubarb will be in greater request than usual. An excellent plan for obtaining good produce is to have plantations of early sorts in the kitchen garden, grown from vigorous seedlings, for the purpose of forcing. When these are at command they will be found valuable, and should be lifted and placed in the mushroom house or warm cellar, in quantities as required. Water the stools with warm water, and syringe the crowns frequently until active growth commences, when less will be necessary.

FRENCH BEANS.—Make sowings of this useful vegetable in pots, and place in the forcing house, where a humid atmosphere and a temperature ranging from 65 to 70 degrees can be maintained. Do not select very large pots: 8in. ones are suitable; crock them rather liberally, and use rich open soil. Leave sufficient space for top-dressing the plants after they are well up, and for the purpose of watering, by only filling the pots about three parts full. Last year Ne Plus Ultra was the most profitable variety with me for early sowings.

LEEKS.—If very early leeks are required for exhibition or other purposes, make a sowing in boxes at once. The seeds will germinate satisfactorily in a newly-started vinery or peach house, but afterwards the seedlings must be kept growing sturdily in a lower temperature, near the glass. A shelf in a comfortable greenhouse—45 to 50 degrees—is suitable. Put the plants singly into thumb pots as soon as ready, using rich soil; water carefully, especially until the roots show round the inside of the pot.

SALADS.—Where plenty of pits or fr are at hand it greatly assists the ki gardener in providing the daily salad. great enemy during the next few weeks be damp. Where frames are filled wi tuce, endive, etc., carefully remove cayed foliage, and ventilate liberally on fine day. Cover the glass and sides of during sharp weather. Mustard and will assist the salading during the se of the next few months.—C. FLACK, mondely Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Scottish Horticultural Association.

The annual business meeting of this association was held in the hall of the Young Men's Christian Association, 14, South St. Andrew Street, Edinburgh, on the 17th inst. Mr. Whytock, the president, occupied the chair, and there was an attendance of 140 members. The report by the council for Session 1910 showed that there was a slight decrease in the membership, but that the work was being carried on as vigorously as ever, the average attendance at the ordinary meetings at which papers are read and subjects discussed being 90. There was a surplus of £43 16s. 11d. on the Chrysanthemum Show, and an increase in the funds of the association of £23 11s. 8d.

The following office-bearers were elected in room of those who retire by rotation: Honorary president, Sir John Gilmour, Bart., of Montrave; president, Mr. W. H. Massie, 1, Waterloo Place, Edinburgh; vice-presidents, Messrs. J. Phillips and W. G. Pirie; councillors, Messrs. G. P. Berry, J. Bruce, R. Cairns, J. C. Grieve, J. Hay, W. Smale, and W. Williamson. The secretary and treasurer, Mr. A. D. Richardson, was re-elected.

The following report by the committee of the joint councils of the association and the Royal Caledonian Horticultural Society, which was appointed on February 9, 1910, to enquire into and advise the councils as to the possibility of amalgamating the two societies, was submitted to the meeting. The committee are unanimously of opinion that it would be in the interest of horticulture generally to have the work in Edinburgh carried on by one strong society rather than by two as at present, and if that were possible they would have no hesitation in advising the councils that such a scheme should be proceeded with. On coming to enquire into the possibility of effecting amalgamation, it was found necessary to consider the means to be adopted. There were three possible methods, namely: (1) By the Royal Caledonian Horticultural Society assuming the Scottish Horticultural Association: (2) by the Scottish Association assuming the Royal Caledonian Society; and (3) by dissolving both societies and forming a new one. The committee rejected the first and second methods, but they gave very serious consideration to the third. When, however, they came to consider the dissolution of the Royal Caledonian Society, they were met with difficulty. The charter gives the society no power to dissolve, and dissolution without the authority of the Crown would involve the risk of forfeiture of the funds. A difficulty was also encountered in connection with the Neill Fund, the administration of which, the committee were advised, could not be transferred to a new society without the consent of Dr. Neill's next-of-kin, who, so far, could not be traced. The committee, thereafter approached the Secretary for Scotland to ascertain whether the Crown would assent to a surrender of the charter, and, if so, on what terms, but the reply received was to the effect that there was no precedent for this, and that the proposal was open to serious objections. The committee, therefore, reluctantly came to the conclusion that the only course open to secure the end in view was to obtain from the Crown a new charter incorporating both societies, but they point out that the cost of this would be somewhat serious, and a charter is not so elastic as an ordinary constitution, and tends to hamper the work of the society.

It was intimated that the Honourable Lady Miller had invited the members to visit Manduston in the course of the summer, and on the recommendation of the council, August 19 was selected as the date.

Twelve new members were elected.

The new president, Mr. Massie, will deliver his inaugural address at the meeting on February 7.

French Horticultural Society of London.

Of very great general interest, and of immense value to its members, is the French Horticultural Society of London. For social intercourse and educational advancement it brings together the many young men who come over from the Continent for the purpose of adding to their knowledge of horticulture by a period of employment in the large market establishments and public parks and gardens of the metropolitan area. The ties of friendship thus made are rarely ever relaxed, and the founder of the society, Mr. George Schneider, is regarded with filial affection by young men now in England, and the larger number who have passed on to important positions on the Continent and further afield.

The annual dinner of this institution was held at the Café Royal on Saturday, January 21, when Mons. Philip de Vilmorin presided. He was to have presided in 1910, but the disastrous floods in Paris kept him at home. Happily he was not detained this time. It was unfortunate Mr. Schneider was not present, and still more unfortunate that his absence was due to severe illness.

After dinner the Chairman proposed "The King and Royal Family," and Sir Albert Rollit proposed "The President of the French Republic," both of which toasts were enthusiastically honoured. A letter of sympathy and the signatures of all present were sent to Mr. Schneider, with sincere hopes for his speedy recovery.

M. de Vilmorin proposed "Success to the Société Francaise d'Horticulture de Londres," and in doing so paid a fine tribute to Mr. Schneider's work in connection with it. He referred to the usefulness of the society, and showed how its regular meetings brought the young men together for mutual help and friendship; and he also said that such a society was scarcely possible but for the continued kindness shown to its members by the proprietors of the leading market establishments, and seed and nursery businesses. Mons. Gentil, chief of the Brussels Botanic Gardens, and an old Kewite, responded, and made reference to many old friendships made while in England. Mr. J. McKerchar proposed "Past Presidents," to which Mr. T. Bevan responded.

In eloquent and humorous French Mr. C. Harman Payne proposed the health of "The Committee and Officers." M. Ripard replied, and also presented, on behalf of the members, a set of dessert cutlery for Mr. Schneider. Meanwhile Mr. Hiehle referred to the generous way in which the Britishers present at the previous annual dinner had contributed towards the sum the society then sent to France for the relief of those who were suffering from the effects of the floods in Paris. It had been the society's intention to celebrate its twenty-first anniversary by contributing to the two British horticultural charities, but the needs of Paris prevented them from fulfilling that intention. Now, however, on their twenty-second anniversary, they were able to offer £20 to the Royal Gardeners' Orphan Fund, and £30 to the Gardeners' Royal Benevolent Institution. Prolonged applause greeted this announcement, and Mr. Edward Sherwood gracefully responded on behalf of these charities. Mr. Arthur W. Sutton gave the toast of "The Chairman," and referred to the great work accomplished by the firm of Vilmorin in the past, and the able manner in which M. Phillip de Vilmorin was conducting the huge business at the present time. He also paid a tribute to the personal qualities of the chairman. The toast was accorded musical honours, and M. Vilmorin very pleasantly replied. M. Ripard proposed "The Horticultural Press," to which Mr. R. Hooper Pearson made a very able response.

Messrs. N. N. Sherwood, P. R. Barr, H. Beale, J. Gardiner, D. Ingamells, J. Heal. W. Atkinson, C. Engelmann, P. Aquatias, T. Bevan, Murison, E. Hawes, H. E. Cove, W. Bateson, Gaskell, and Melady were among those present, in addition to the various speakers. There was a long programme of music, sketches, and ventriloquism, and the gathering lasted about five hours.

Royal Scottish Arboricultural Society.

(ABERDEEN BRANCH).

The annual meeting of the Aberdeen branch of this society was held in the Aberdeen University Buildings, Aberdeen, on Saturday, 14th inst., and was attended by a large and representative gathering of county gentlemen, factors, wood merchants, and foresters. Mr. Sydney J. Gammell, of Drumtochty and Countesswells, the president of the branch, occupied the chair, and was accompanied by the Right Hon. Robert Farquharson of Finzean, Sir John Fleming, of Dalmuinzie, Mr. John Michie, M.V.O., factor to his Majesty the King at Balmoral, and the lecturer of the afternoon, Mr. Donald Munro, of the Silverbank Sawmills, Banchory-Ternan, Kincardineshire. A large number of new members having been nominated, and cordially admitted, the secretary, Mr. G. D. Massie, solicitor, Aberdeen, submitted his annual report, which stated that the work of the branch had been conducted on similar lines to those of former years. The membership had increased. The meetings and excursions held during the year had been better attended than formerly, but there was room for improvement regarding the attendance of country members, and suggestions were invited as to how this could be improved.

The Hon. Treasurer submitted his report, from which it appeared that after meeting all outlays there remained a balance of £21 17s. at the credit of the branch. Mr. Irvine,

Eckford's GIANT
SWEET PEAS
THE FINEST BLOOMS IN THE WORLD.
that blossom on the Sweet Pea Plant are grown from Eckford's famous seeds. Eckford, the Sweet Pea Specialist, supplies only seeds that are bound to give good results. Eckford's seeds flower brilliantly, and succeed even in the most difficult soils.
ECKFORD'S are the largest retailers of Sweet Peas in the world, and do not supply the trade.

Villa (C) Collection.
12 Splendid varieties, suitable for exhibition, 50 seeds of each, **2/9**, post free for cash.
Villa (E) Collection.
12 Extra varieties, suitable for exhibition, 25 seeds of each, **1/6**, post free for cash.
A specially written Booklet on Sweet Pea Growing given with every order.
FREE. Send a postcard to-day for large Illustrated and Coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.
HENRY ECKFORD, F.R.H.S.
(Dept. 221), Wem, Shropshire.

of Drum, moved the adoption of the report and accounts, and said he thought their finances were in a very satisfactory condition. Mr. C. S. France, Aberdeen, seconded, and the motion was unanimously adopted. Office-bearers were then elected for the ensuing year, Mr. Gammell being cordially re-elected president, and Professor Trail, Mr. John Michie, Mr. A. Forbes Irvine, of Drum, and Mr. France, vice-presidents. A large and representative committee, comprising county gentlemen, factors, wood merchants, and foresters was also appointed. The President then called on Mr. Donald Munro, of Messrs. A. and G. Paterson, Ltd., Silverbank Sawmills, Banchory, to deliver his lecture on "The Home Timber Outlook and the Urgent Need for Afforestation," to which we shall refer in an early issue.

National Chrysanthemum Society.

A meeting of the Executive Committee of the above society was held on Monday evening last, when the chair was taken by Mr. T. Bevan.

The proceedings were chiefly of a routine character, in view of the society's approaching annual meeting on February 6, which will be held at Carr's Restaurant, at 7 p.m. It is expected that Sir Albert Rollit, president of the society, will occupy the chair on that occasion.

The dates of the society's 1911 shows were fixed provisionally, pending final arrangements with the Receiver of the Crystal Palace Company. The accounts for the past year were submitted and approved of, subject to audit. The draft annual report for 1910 was discussed and recommended for presentation at the annual meeting.

The question then arose as to the advisability of holding a conference in 1911, and Mr. Ladds proposed, and Mr. Oliver seconded, that one be held towards the close of the year, which was carried unanimously. The date of the conference and the subjects to be dealt with were left open for further consideration.

The meeting closed with the election of new members.

Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College on the evening of the 12th inst. Mr. William Grant presided over a good attendance of members. The essayist was Mr. Findlay Macrae, Linbank, Fossoway, Kinross-shire, and his subject was "The Garden and the Gardener; Past and Present—a Comparison."

Beginning with the Garden of Eden and its gardener, Mr. Macrae traced the rise and fall of gardening down to the Christian era, telling what ancient Greece and Rome had done for the art.

He quoted from ancient writers and historians, showing that these nations had taken their share in broadening the scope of horticulture. Britain owed much that was her's horticulturally to the Romans. Then the monks carried on the work, their gardens being used chiefly for the growing of medicinal herbs for the healing of man. Then the different phases, crazes, and styles of gardening as practised in every era was commented upon, while the gardener of to-day was contrasted with "Capability Brown" and those of his day, who, perhaps, were held in higher esteem than was the former. But there was no gain-saying the fact that gardening and gardens were in a healthier condition at the present time than in Brown's day, and the improving condition would continue much more rapidly a few years hence, when perhaps the craft would be dominated by a State Horticultural Board, with a Minister all its own.

The gardener's lot was criticised to some length in an animated discussion which took place on Mr. Macrae's essay, some of the members being of opinion that gardeners were themselves responsible for many of the so-called grievances which existed; while others contended that under present conditions worth was seldom recognised, and that there were many "lucky ones" who were "pitchforked" into situations through friendship and business, while better qualified men were allowed to go under, through no other cause than that they were without the opportunity of having their worth brought into prominence.

At the close of the discussion Mr. D. C. Hutchison proposed the thanks of the meeting to Mr. Macrae for his very able, instructive, and high-class literary paper. Mr. Macrae suitably replied.

Broughty Ferry Horticultural Association.

The opening meeting of the session was held on the evening of the 17th inst. The hon. president (F. M. Baxter, Esq., Balluniefield) presided, and the president (Mr. James Bethel, The Grange Gardens, Monifieth), gave the opening address, taking as his subject, "Economy in the Garden." The gardener, through force of circumstances, was a qualified economist in home and every-day life. With his usual characteristic humour, Mr. Bethel went on to deal with scientific and practical economy in the working of the garden. The chief points which he took up were economy in manuring, in preparation of the soil, in sowing the seed, and arrangement of the crops, and the economy of time. These afforded scope for logical argument, and he was not slow to take advantage of the opportunity for showing his knowledge of sound, practical work, and up-to-date science.

British Gardeners' Association.

(LONDON BRANCH.)

The January monthly meeting of this branch took place at Carr's Restaurant, and the chair was occupied by Mr. W. H. North. The principal event of the evening was an address by Mr. E. F. Hawes, on "The Importance of Gardeners Combining." To prove the value of combination, the speaker referred to the many advantages enjoyed by other professions which have combined into effective associations for the protection of their own interests, such as doctors, architects, engineers, etc. It is very necessary that gardeners should rouse themselves from the spirit of conservative apathy which has dominated them for so long, if they wish to keep pace with the times. They must take the necessary steps to improve their social status and conditions of employment, and this can best be done by joining an association such as the B.G.A.

Speaking of the difficulties of dealing with private employers, Mr. Hawes considers that everything depends upon the gardeners themselves. They must convince their employers that they are a necessity, and not a luxury, by giving full value in return for the employers' outlay, thereby ensuring his respect and sympathy. After an interesting discussion, in which many members took part, the meeting terminated with a hearty vote of thanks to Mr. Hawes for his interesting address.

Sparmannia africana.—This, the African hemp, so called from the tough fibre extracted from the stems, is a beautiful winter-flowering shrub for the greenhouse, the blossoms being quite unlike those of any other occupant of that structure. Complaints are sometimes made that it does not flower freely, although it grows luxuriantly. This latter is the very reason of the paucity of flowers, for it needs a limit to be placed on the extension of the roots, and, what is more, to undergo a thorough ripening by full exposure to the sun towards the end of July and throughout the month of August. While stood out of doors at that season it must be supplied with water as heretofore. The prominent feature of the flowers is the crowd of long filaments, which are in colour purple at the basal portion and on the upper part of a golden hue.—W. T.

NEW BOOKS.

WHO'S WHO, 1911.

(Messrs. A. and C. Black, Soho Square, London). Price 10s.

For upwards of sixty years "Who's Who" has been held in high estimation as a work of reference, and the edition for the current year, which is now before us, affords ample evidence that those responsible for the production of the work are filled with a desire to maintain the high position it so worthily occupies. There is no occasion to praise a book that is so well-known and highly appreciated, but it should be said in justice to the publishers that it is impossible in looking through the 2,246 pages to repress a feeling of admiration for the skill displayed in the compilation of the biographies of the 17,000 or 18,000 men and women who are included in the book. There is no eulogistic remarks, but the information relating to the antecedents, and the work of those who have distinguished themselves in the arts and sciences, in the learned and other professions, in industrial activities in the world of politics, and of the position occupied by those high in the social scale, is stated in such manner as to leave no doubt upon the reader as to the value of their accomplishments in their several walks of life. As a work of reference "Who's Who" is of immense value, and should be in the hands of all who take an active interest in the various matters that engage public attention.

HORTICULTURAL DIRECTORY, 1911.

("Journal of Horticulture" and "Poultry" Office, 12, Mitre Court Chambers, Fleet Street, London.) Price 1s.

A well-known annual, which is highly popular for its directories of the nursery, seed, and other trades associated with horticultural enterprise, and for its directory of gardeners, this last being specially remarkable for its comprehensiveness.

THE GARDEN ANNUAL, 1911.

("Gardening Illustrated" Office, 17, Furnival Street, London.) Price 1s.

An admirably prepared work, containing a full directory of nurserymen, seedsmen, florists, market gardeners, and fruit growers, in which the names are first arranged in alphabetical order, and afterwards classified under the various towns. It also contains a directory of gardeners and gardens, which is so arranged as to facilitate ready reference.

OBITUARY.

MR. E. HOBDAY.

It is with much regret that we have to record the death of Mr. E. Hobday, which occurred at his residence at Romford on the 17th inst. Mr. Hobday devoted much of his leisure to the products of the kitchen garden, and in connection with them he achieved so high a degree of success that he has long been regarded as one of the foremost amateur cultivators of vegetables in this country. For some years he was one of the principal competitors for the prizes for vegetables offered at the exhibitions and meetings of the National Amateur Gardeners' Association, and many were the challenge trophies and other prizes awarded for his products. Of late years Mr. Hobday has, owing probably to indifferent health, taken a less prominent part at competitive gatherings, but when he has shown, his produce has been presented in his usual high-class style. He was one of the founders of the National Vegetable Society, and at the time of his death was a member of the committee, in which position he rendered valuable services in the cause of vegetable culture, and enjoyed the esteem of his colleagues.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

INTERNATIONAL HORTICULTURAL EXHIBITION.—M. T. M., Hednesford: The International Horticultural Exhibition will be held in the grounds of the Royal Hospital, Chelsea, in May, 1912. The hon. secretary of the exhibition is Mr. Edward White, and his address is 7, Victoria Street, London, S.W.

RHODODENDRON KEWENSE.—S. J. S., Harrow: This beautiful hybrid was raised at Kew in 1874, and flowered first in 1888; its parents were R. Aucklandi and R. Hookeri. It is quite hardy, and grows to a bush of considerable size. The wide flowers are rose-pink, fading to white, but in some forms the flowers are nearly pure white. The hybrid is a very fine one, and very suitable for a cool conservatory or a winter garden. In the open it flowers rather too early, except in very favourable localities, and therefore its blooms often suffer from the effects of late frosts in April and May.

ANNUAL TROPÆOLUMS.—M. W., Exeter: The chief annual species of Tropæolum are T. Lobbianum, T. majus, T. minus, and T. peregrinum, the latter better known in gardens as T. canariense or Canary creeper. Of the three first-named species there are a very large number of varieties, showing a considerable range of colouring. There are double varieties of T. majus.

RANGE OF COLOUR IN A GENUS.—A. S. E., Waterford: At the present moment the genus that occurs to us as showing an unusually wide range of colour is delphinium. Blue, white, and pink, in almost endless shades are found in garden varieties, with violet and purple also. White flowers are found in garden varieties and in D. exaltatum, and D. grandiflorum; in D. intermedium some forms have almost black petals; D. Zalil gives yellowish flowers; D. nudicaule, red, orange, and yellow; and D. cardinale has scarlet flowers. Hyacinths also show a very wide colour range, and so do irises.

HANDY BOOK ON BRITISH BOTANY.—F. E. L., Weymouth: In addition to your "Hooker's Students' Flora" you should obtain "Hayward's Botanist's Pocket Book." (George Bell and Sons, London), which is a particularly handy book for field botany.

HORTICULTURAL SOCIETIES AND SECRETARIES.—S. F., Chester: By far the most complete list of horticultural and botanical societies in the United Kingdom, with name and address of the secretary in each case, is to be found in the "Gardening Year Book for 1911." This handy little volume also contains the name, area, and superintendent of practically all the public parks and open spaces in the United Kingdom, descriptions of the new plants of 1910, and a store of cultural and other useful information. It can be obtained from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C., for 1s. 2d., post free.

LARCH CANKER.—J. B., Trent: When larch is planted in lowland districts, and especially if the atmosphere is generally damp and sluggish, the trees have not that robustness that characterises them when growing at higher altitudes. Canker is more prevalent among larch growing in a damp position than among those growing in a drier and airy one, and in such cases it is also quicker in its effect upon the trees. Do not

The ORIGINAL soil insecticide

Safe, certain, satisfactory. Use 1 lb. to [illegible] sq. yds. while digging. Sold by all Seedsmen in tins, from **9d.** to **4 6**; in ½ cwt. casks, **7 6** or **11 6** per cwt. (car. pd.) Booklet No. 45, from **VAPORITE STRAWSON Co., Ltd., Dept. E, Spencer House, South Place, E.C.**

kills soil pests

"HOW TO MAKE YOUR OWN SOIL FUMIGATOR." Save the fabulous profits on secret formulas. Make your own at LESS than ½d. per lb. Precisely as sold at 9d. and 1s. lb. tins. Sell to your neighbours, make 900 per cent. profit. Completely destroys wireworms, snails, woodlice, ants, leather-jackets, etc. Harmless to plants. Supersedes gas-lime. Send 1s. for recipe, and save money.—T. HUGHES, Analyst, Elmhurst, Northwich.

AMERICAN TREE CARNATIONS, best varieties, including Britannia, White Perfection, etc., strong young plants from 2in. pots, 3s. doz., 20s. 100, flowering plants, 5in. pots, 8s. per doz. G. S. EVANS, F.R.H.S., Carnation Specialist, Bexley Heath.

FERNS, FERNS, FERNS, etc.—Foliage and Blooming Plants for stove, greenhouse, and garden. 100,000 large garden Ferns, 20s. 100. 5,000 cases sent off yearly. Amateur Catalogue free. J. E. SMITH, London Fern Nursery, Loughborough Junction, S.W.

AMERICAN and BRITISH TREE CARNATION.—Leading varieties from 3s. per doz.; 17s. 6d. per 100; carriage and packing free for cash. Ask ill. price list. C. F. A. VAN DER SLUYS, F.R.H.S., Ramee, Guernsey.

CHRYSANTHEMUMS.—Mrs. Frank Hill, A.M., R.H.S.; Brightness, A.M., R.H.S., Singles. Send for lists. GEO. WILLIAMS and SONS, Chrysanthemum Specialists, Canton, Cardiff.

FOR SALE, Nursery Business, in good-class London suburb; long lease; low rent; reason for disposal, ill-health; excellent neighbourhood for jobbing; price £300.—F. JAMES, 11, Belvoir Road, Dulwich, S.E.

TO BE LET, SMALL NURSERY, with Jobbing connection if desired; growing seaside resort, easy distance London, East coast; ingoings, £200—£250; low rent to good tenant. Fuller particulars, apply Box 63 Y, Office of this Journal.

SEED BOXES.—12 x 9 x 2in. timber, 8s. 9d. gross, made, 10s. 3d.; 15 x 9 x 2in., 10s. 3d., made 11s. 9d.; also flower sticks, trellis, greenhouses, garden lights, or timber of all description. C. JENNINGS and CO., Timber Merchants, General Woodworkers, 916, Pennywell Road, Bristol.

plant larch in damp, low, heavy soil. To stay the disease steps should be taken to cut away any cankered portion as soon as it is detected, immediately dressing the wound with a strong solution of sulphate of iron, followed by an application of tar. The larch canker is due to a fungus named Dasyscypha calycina.

APPLE CLAYGATE PEARMAIN.—W. C. A., Leicester: This useful winter apple was found by Mr. John Braddick growing in a hedge near his garden at Claygate, near Thames Ditton, in Surrey. Braddick was a keen horticulturist, and he raised the apple named Braddick's Nonpareil. He died at Boughton Mount, near Maidstone, in 1828.

BARIUM CARBONATE AS RAT POISON.—A. L. D., Buscot: Barium carbonate is considered one of the cheapest and most effective poisons for rats and mice. It is without taste or smell, has a corrosive action on the mucus lining of the stomach, and, causing thirst, induces the vermin to seek water in the open, where they die. In the small doses used it is said to be harmless to domestic animals. It may be employed in the proportion of one part of the carbonate to four parts of meal, mixed to a dough with water. A convenient bait is composed of one part by measure of the mineral to eight parts of oatmeal, mixed to a stiff dough. The carbonate may also be spread on fish or moist toasted bread. In 1905 large quantities of a poisonous food were sent out by the Agricultural Botanical Institute at Munich for the purpose of destroying field mice, and it is stated that it chiefly contained barium carbonate.

NAMES OF PLANTS.

T. A. H., Ackworth.—Billbergia nutans.

T., Byfleet.—Odontoglossum pulchellum.

E. G. M., Scarborough.—1, Odontoglossum Wilckeanum; 2, O. concinnum.

F. F. Birkenhead.—1, Cypripedium Calypso; 2, Cœlogyne cristata.

W. H., Marlingford.—1, Chimonanthus fragrans. 2, Helleborus colchicus.

H. L., Tetbury.—1, Ornithogalum lacteum; 2, an eranthemum; 3, not recognised, send when in flower.

J. S. J., Lewes.—1, Reinwardtia tetragina; 2, Sparmannia africana; 3, Hamamelis arborea; 4, Begonia manicta.

S. E. C., Norwich.—1, Begonia Gloire de Sceaux; 2, Cattleya Percivaliana; 3, Hoffmannia refulgens; 4, Lonicera sempervirens.

TRADE NOTES.

From the Hardy Patent Pick Company, Lim., of Sheffield, we have received one of the several sets of garden tools of which the firm makes a speciality. The one that has been submitted to us is that known as the Lady's or Youth's Set, and is in every way suited to the requirements of lady and youthful gardeners. Included in the set are spade, fork, rake, trowel, and weed fork, and the implements are remarkable alike for their lightness and strength.

The business of the late Mr. Robert R. Mawson, of The Nurseries, Windermere, will, we are informed, in future be under the management of Mrs. Mawson's nephews, Messrs. William and Richard Mattocks, who have been in the firm's employ for twelve and ten years respectively.

Messrs. James Carter and Co., Raynes Park, London, have, by special warrant dated January 17, 1911, been appointed seedsmen to the German Emperor.

FORTHCOMING ENGAGEMENTS.

TUESDAY, January 31.—Committees meet at 12 o'clock; lecture at 3 p.m. on "Colour Photography," by Mr. Wm. Marshall.
THURSDAY, February 2.—Linnean Society.
SATURDAY, February 4.—French Horticultural Society of London.
MONDAY, February 6.—Dorchester Horticultural Society meets.
TUESDAY, February 7.—Scottish Horticultural Association meets.
THURSDAY, February 9.—National Horticultural Society of London, Exhibition in Paris.

MARKETS.

CATALOGUES RECEIVED.

GEORGE BUNYARD AND CO., LTD., MAIDSTONE. In its catalogue of trees and shrubs the Maidstone firm groups rhododendrons into four colour divisions, describes almost every variety according to the Repertoire de Couleurs, and indicates whether they are early, midseason, or late-flowering; a very useful arrangement.

JAMES CARTER AND CO., RAYNES PARK, LONDON, S.W.—The beautiful and freely illustrated seed catalogue is a work of art, as well as a book of reference. Sweet peas, culinary peas, primulas, eschscholtzias, begonias, asters, and tomatoes receive special attention, and include numerous novelties.

BARR AND SONS, KING STREET, COVENT GARDEN, W.C.—This firm's seed catalogue is very finely arranged. The novelties include rare alpine, hardy perennial and greenhouse plants, and fill nearly ten pages. The lists of popular names of flowers are interesting, and, as on previous occasions, the whole catalogue is arranged alphabetically to facilitate ready reference.

JAMES BACKHOUSE AND SON, LTD., YORK.—In the fully indexed and freely illustrated seed catalogue recently issued, the Messrs. Backhouse make a feature of page portraits of selected vegetables, sweet peas, etc. There are a dozen of these large pictures and they make the catalogue very attractive.

J. STORMONTH AND SON, KIRKBRIDE, CARLISLE.—This very interesting catalogue from "the border" contains a wide range of garden subjects; in most cases penny packets of seeds can be obtained and the number of seeds per packet, whatever the price, is stated. Descriptive and cultural information is abundant—and the illustrations are very numerous. All seeds are "warranted pure, of good germination, and true to name and description."

AMOS PERRY, ENFIELD, MIDDLESEX.—The new lists include a special offer of shrubs, a descriptive one of liliums and other bulbs and tubers, and one of seeds of perennial hardy plants.

R. H. BATH, LIM., FLORAL FARMS, WISBECH.—Though less bulky than many others, this seed catalogue is none the less useful and interesting; descriptions and cultural notes are brief and to the [illegible]; the lists of vegetable and seed novelties show evidence of restraint and selection, and the whole list is under four inches wide, so that it can be slipped into the pocket and used as a garden companion.

HENRY ECKFORD, WEM, SHROPSHIRE.—As M[illegible] comes the originator of modern sweet peas, [illegible] Eckford's seed list is adorned on both covers with coloured portraits of new varieties of these [illegible] annuals. We gather that, whereas twenty years [illegible] the Eckfords grew less than two acres of sweet peas for seed, they had eighty acres under this crop last year. Culinary peas are also a speciality of the firm, and the present catalogue includes a wide range of vegetable and flower seeds.

JAMES VEITCH AND SONS, CHELSEA, S.W.—In this chrysanthemum list the new varieties are described on the first three pages, Japanese and [illegible] varieties being most numerous. The general lists are very well arranged, and the descriptions brief but sufficient.

GARDENER (Single-handed or with help); age 33; married, one girl, five; life experience Inside and Out; good references. A. READ, Beechmont Farm, Sevenoaks.

GARDENER (good Single-handed, or where help is given); age 38; married; 25 years' experience in all branches; good references. E. SMITH, 92, Chaplin Road, Willesden Green, N.W.

MR. J. NICOLL wishes to highly recommend J. FRENCH as GARDENER; good Single-handed, or Head of two or three; age 25; experience in all branches; married when suited. J. FRENCH, Ravenswood, South Wonston, Hants.

FOREMAN (Inside or General).—Mr. G. DEADMAN, The Gardens, Cowbridge House, Malmesbury, Wilts, can with confidence highly recommend W. PHILLIPS as above; 14 years' experience, Fruits, Stove, Greenhouse Plants, Chrysanthemums, Carnations, Decorating; good references; age 29; disengaged. Rose Cottage, Kingscote, Wotton-under-Edge, Glos.

MANAGER or FOREMAN; life experience in Growing Tomatoes, Cucumbers, Mushrooms, and all kinds of Bedding Plants; age 49; single. C. A., 9, Herbert Street, Chesterton, Cambridge.

MR. C. HARDING, Head Gardener to the Marquis of Hertford, wishes to highly recommend his FOREMAN to any Lady or Gentleman requiring a thorough practical Gardener; age 35; been here seven years. Address, C. HARDING, Ragley Gardens, Alcester.

C. W. CATT, Esq., will be pleased to recommend his SECOND GARDENER to any lady or gentleman; a thoroughly trustworthy and energetic Man, as Head Working Gardener, where 3 or 4 are kept, his credentials are of the highest order. Full particulars on application. Outwoods Gardens, Duffield, Derby.

JOURNEYMAN (Inside) in good establishment; age 19, five years' experience. EMERY, Hylands Park, Chelmsford, Essex.

GARDENER.—Private Working or Market Garden Nursery, grower cucumbers, tomatoes, chrys., bedding, mushrooms (ridge or flat), vegetables, hardy fruits, budder, grafter, trainer, pruner, raiser rose cuttings; life experience, good references. W. BLOOMFIELD, Staplehurst, Kent.

GROOM-GARDENER (Single or Under Gardener), good knowledge, Inside and Out, good references. C. E. STEPHENS, 59, Johnson Road, West Croydon.

UNDER GARDENER, Young Man, seeks SITUATION as above; age 19-20; good refs.; 3 years 9 months last place. C. T. COLESHILL, 37, Wolsey Road, Hampton Hill, Middlesex.

MR. R. STAWARD, Panshanger, wishes to recommend WALTER MORGAN as IMPROVER (Inside or Out); age 18; three years' experience; Bothy preferred; disengaged. Cole Green, Hertford, Herts.

YOUNG MAN, age 23, seeks SITUATION, Single-handed, or where another is kept, Inside and Out; good personal reference from present employer; four years present situation. A. SANDY, 20, New End Square, Hampstead, N.W.

YOUNG MAN (age 25), with 10 years' experience in all branches of horticultural work, including orchid growing, seeks SITUATION in good nursery or private place; highest references. W. BARRETT, Apiaries, Old Bath Road, Cheltenham.

YOUNG MAN seeks SITUATION (Inside and Out); 6 years' experience; well recommended; age 22. H. YATES, 82, Crawley Road, Horsham, Sussex.

YOUNG MAN (21) seeks SITUATION in good garden; 6 years' experience; excellent references; 2 years' last place; left through people giving up; in or near London preferred. G. CHANDLER, 58, Westland Terrace, Queens Road, Alton, Hants.

YOUTH, age 18, seeks SITUATION in gentleman's garden, where two or more are kept; also good milker and total abstainer; good references. H. SMALL, 73, Church Lane, Boxgrove, Chichester.

GENTLEMAN recommends YOUNG MAN, age 22, as Second of four or five; Inside and Out; 7 years' experience; good reference. Apply T. ROGERS, Michelmersh, Romsey, Hants.

YOUNG MAN (20) seeks SITUATION as 3rd, where 4 or 5 are kept; 5 years' experience; good character; prefers Bothy, and down south. A. J. C., 10, Office of this Paper.

SITUATION required in Gentleman's garden by Lad, age 16; preferably Glass; willing and anxious to learn; good references; two years in garden. JONES, Highlands, Fownhope, Hereford.

GARDEN LABOURER wants SITUATION; married, no family; well used to outside work; good spade and scythe hand; well recommended; no circulars. W. LING, Sutton Field, Sutton Bonington, Loughboro'.

HANDYMAN seeks SITUATION; well up in all classes of work; useful in any part of garden, good references. R., 65, Harberton Road, Highgate.

IMPROVER, age 17, seeks SITUATION in Private Gardens (Inside); four years present place; two kept, well recommended, disengaged when suited. Apply, P. DANN, care of [illegible] Hon. R. [illegible], St. Johns, Bishopstoke.

KNIFESMAN, age 25, married; abstainer; 10 years' experience in Budding, Grafting, Training, etc. H. HILL, 17, Poynter Road, Bush Hill Park, Enfield, Middlesex, N.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For FEBRUARY 11, 1911.

Please Repeat my Advertisement.

Date..........................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

2,500 BEAU-IDEAL BLUE BEDDING LOBELIA for 1d.

What is the use paying 1/- or 2/6 for a packet of Lobelia seed when you can get all the plants you require for a 1d. or 2d.? Of course, you have been paying these high prices in order to get the best seed. But you need do this no longer. All the seeds retailed by Stormonths are of the best procurable strains, equal to anything retailed at the old-fashioned prices, and they will supply any quantity, from 1d. worth upwards.

TAKE THIS LOBELIA AS AN EXAMPLE. The seed is warranted pure, of good germination, and true to name, saved only from plants raised from cuttings, propagated from stock plants selected true to type, compact in habit, perfect in colour and flower, and free blooming. In short, the finest improved English strains of Crystal Palace Compact Lobelia.

GARDENERS WHO WISH TO KEEP EXPENSES DOWN, and employers who desire variety as well as quality in their gardens, should send for a copy of Stormonths' Catalogue of warranted Beau Ideal Seeds, free on request.

STORMONTHS, 8, Kirkbride, Carlisle.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Lengthening Days.

It is always a great comfort to the garden lover when, after the turn of the year, an appreciable difference in the length of the day indicates that commencing flow of the annual tide of sunshine which is the life and soul of floriculture, as it is of all vitality in this wonderful world of ours. It is the antithesis of the feeling we experience at the slowly commencing ebb which we remark in the late summer months, when the days, as it is said, "commence to draw in." Then, however, we feel, it may be, sated with the floral feast we have enjoyed, and which is still continuing, course after course, as it were, commencing with the hors d'œuvres of the early spring, continuing with the innumerable and exquisite entremets which Nature provides for our delectation in the summer, and soon, as we hope, culminating in the "dessert," represented by the autumnal crops of fruit. Then, as the days become shorter and shorter, as the beneficent sun withdraws more and more his vitalising rays, a period of more or less depression is apt to steal upon us, the garden rapidly loses much of its charm, as flower after flower sinks to rest, and finally we plunge into the gloom of winter, when frost and storm have done their worst and our banquet aforesaid becomes but a memory. Now, however, when the opposite conditions are beginning to indicate the advent of another flood of sunshine, the garden lover is delighted to go round and note the early results of floral awakening. Long before obvious growth above ground, the roots of most perennials are busy preparing for the new campaign. Here and there may be seen the tips of bulb foliage breaking through the soil, and crocus and snowdrops profit by every period of thaw to push their foliage through, and even to display their earliest blossoms where conditions for early development are favourable. The buds of many trees and shrubs are fattening up, and between their protecting sheaths or scales the clean fresh green of newly-exposed surface contrasts strongly with the dull exterior which has served as protection hitherto. In the heart of the fern crown, if we remove the leaves which have filled up its centre as a natural protection, we shall see more fresh surfaces exposed as the incipient fronds have swollen and lifted slightly to make room for themselves, thus exposing the delicate scales with which they are clothed and protected in another and more independent fashion. The paeonies may be seen to be pushing rich crimson spikes through the soil, and in all directions the roses and clematises are probably wasting their substance by precocious shoots, bound almost inevitably to suffer sorely from the winter blasts which have yet to be experienced. It is curious in this connection that many plants appear incapable of thoroughly learning, as it were, the lessons of the seasons. Thus the almond tree, a native of warmer climes, though long introduced, and forming large specimens, will insist upon starting growth and displaying its beautiful rosy flowers long before, in this climate, it is likely to escape a drastic touch of frost, and so lose its labour, so far as fruit production is concerned. Our native trees, on the other hand, are impervious to the blandishments of the warm periods which now and again intervene, and, until the end of January, seemed almost persistent. Doubtless within them the impulses of spring are having their preparative effect, and the sap is accumulating in their cells, and beginning to exert that pressure which, at the proper time, will lead to the bursting forth of bud and blossom, but these experienced natives restrain themselves wisely, and reserve the outburst until there is little risk of a drastic check. From the plant point of view, indeed, our so-called winter must be regarded as tricky and treacherous. Long spells of coaxing warmth and congenial moisture are almost invariably followed by keen frost and drying winds, while very rarely do they enjoy the continued protection of a blanket of snow, which is the salvation of many alpines. In their natural habitats the great majority of these vegetable gems are cosily embedded in snowdrifts, which shelter them both from extreme frost and the wear and tear of wintry storms, the result being that when this blanket is dissolved by the sunshine, they reappear with their vigour unsapped, while their kindred in the rockwork of our alpine collections are too often decimated, or weakened, by exposure to wet and freakish frost and thaw, so that it is really a wonder that they manage to survive and gladden our eyes with their beautiful flowers, as so many of them do, despite these handicaps.

G.M.1601.

MR. R. FORESTER FELTON.

Mr. R. Forester Felton.—Among those who have done so much to popularise the art of floral decoration during the last dozen years or so no one occupies a higher position than the subject of the present note. Mr. Felton is the head of Messrs. R. Felton and Sons, Court Florists, Hanover Square, W., and he is a florist to the finger tips. Not only can he arrange plants and flowers beautifully, but he has a genius for creating new designs, for making quite new features in his larger opportunities, and for producing novel and striking combinations. His skill is at once creative and executive, and this is the reason he has become so renowned. After working in a Birmingham nursery and also as a florist in the Midlands, Mr. Felton came to London and acted as decorator for Messrs. J. Standish and Co., of Ascot and Knightsbridge, presently becoming a partner in that firm. Subsequently he commenced business on his own account at Hanover Square, where his fine premises are familiar to those who know the west-end of London well. Mr. Felton has many medals and prizes to his credit, won at the larger exhibitions in the United Kingdom, and he has recently written a delightful book on "British Floral Decoration." He is florist to Claridge's Hotel, Hotel Cecil, and the New Connaught Rooms. He decorated the British Embassy at Berlin in 1909, when King Edward and Queen Alexandra and the German Emperor were present. He has decorated Messrs. Waring's establishment in Oxford Street on several special occasions; King Edward entrusted him with the decoration of the Albert Hall on the occasion of the Union Jack Concert, and in 1908 he decorated the Royal Box at Olympia, at the great Horse Show, in a way that merited high praise from all who saw it. Mr. Felton has also carried out several large orders for King George V., and he is already weaving new plans for floral decoration in connection with the forthcoming Coronation festivities. Mr. Felton is quick to appreciate the decorative value of any new plant, flower, or variety that appears, and his opinion of the worth of a new introduction as a market plant or flower is eagerly sought after. Undoubtedly Mr. Felton has lifted British floral art to a plane it has never previously occupied, and it is not necessary now to go to Paris to see beautiful flowers arranged with skill and taste.

National Sweet Pea Society's Rules.—The committee of the National Sweet Pea Society is busily engaged in the revision of the rules, in accordance with the arrangement that was made at the recent special general meeting, and much interest is evinced by large numbers of members in what is being done. Some enquiries have reached us as to the lines that will be taken in formulating the rules relating to the Floral Committee, but it should be obvious that we are not in a position to give any information with regard to the matter. We can, however, say that we trust the rules will not require the number of members to exceed twelve, and that there will be no reference to amateur or trade members in the rule governing the constitution of the committee. For this purpose it is not only wholly unnecessary, but harmful to differentiate between amateurs and seedsmen, because of the limitation imposed upon these responsible for making a selection. The members of the Floral Committee should consist of specialists fully qualified for the duties they have to perform, and if care is taken to place none but these on the committee, it matters not whether they be amateurs or traders, for the work will be well done.

The Demonstration of Colour Photography in its relation to the flower garden at the afternoon meeting of the Royal Horticultural Society on Tuesday last, was of exceptional excellence, and the crowded lecture room was sufficient evidence that an immense amount of interest is being taken in the photography of flowers and garden scenes in their natural colours. Mr. William Marshall, of Henley-on-Thames, who was the lecturer, did not enter into the technicalities of the autochrome process by which his slides had been produced, but devoted the time at his disposal, and wisely so, to showing on the screen the remarkable results that with skilful manipulation may be obtained. Altogether Mr. Marshall showed upwards of one hundred and forty slides, all of which were from photographs taken in the garden or woodland, and more or less meritorious. The earlier slides were devoted to cut flowers, and very attractive were the tasteful arrangements of daffodils, roses, chrysanthemums, and other popular flowers. Then followed a series of slides in which roses predominated, and these proved highly popular with the audience, the beautiful Dorothy Perkins, although rather too freely represented, evoking the warmest expressions of approval. Very fine also were the slides representative of the manifold charms of an extensive and skilfully arranged garden devoted to plants from alpine regions, not a few of the photographs having, it may be assumed, been taken in the alpine garden which forms so important a feature of the gardens of Friars' Park, the residence of Sir Frank Crisp. Such commonplace subjects as beds and vases of zonal and ivy-leaf pelargoniums were highly attractive, and it was interesting to observe how admirably the rich colouring of the scarlet zonals, and the soft hues of the ivy-leaf varieties were reproduced. The numerous slides of borders of herbaceous plants, and of woods and specimen trees remarkable for their rich autumn tints, were not less interesting. At the close of the lecture, Mr. George Gordon, who presided, stated, in conveying the thanks of the Fellows to Mr. Marshall for his splendid demonstration of the wonders of colour photography, that the slides shown were the finest set from photographs of plants, flowers, and trees in their natural colours that he had seen, and expressed the hope that the day was not far distant when it would be possible to largely replace the uncoloured lantern slides now in general use by such slides as those shown on that occasion.

Royal Gardeners' Orphan Fund.—The annual meeting and election will be held at Simpson's, Strand, W.C., at 3 p.m. on Friday, February 10. The annual friendly dinner of the committee will follow upon the completion of the business of the day, and the chairman of the committee, Mr. Henry B. May, V.M.H., will preside. Dinner is at 6 for 6.30 p.m. sharp.

Nehemiah Grew.—The second of the course of lectures at the University College, London, on the "History of British Botany" was given on Friday, the 27th ult. The lecturer was Dr. Agnes Arbery, F.L.S., and her lecture was devoted to the life and work of Nehemiah Grew, who may be described as the earliest vegetable anatomist in England. This eminent investigator, who was born in 1628, was the son of Obadiah Grew, a Nonconformist minister of Coventry. At the Restoration, his father being ejected from his living, he went to a foreign university, where he took the degree of Doctor of Medicine, and it may be assumed developed a taste for the study of the structure of plants. Having taken his degree and returned to Coventry, he commenced the study of the anatomy of plants, and this he pursued with so much success that he communicated the results to the Royal Society, and they were received with so much favour that he was induced to take up his residence in London. Here he soon worked up an extensive practice as a physician, and continuing his investigations in plant anatomy, he was in a few years elected a Fellow of the Royal Society, and in 1677 was appointed its secretary. In the year 1672 was published his work entitled "The Anatomy of Plants," which created an immense amount of interest, and brought him much fame. It is difficult at this distant period to fully appreciate the intense interest created by Grew's fine work, but at that time the microscope had reached a state of perfection that enabled those fortunate in the possession of an instrument and able to use it with some amount of skill to pry into the mysteries of plant life that had not previously been possible. Grew used his microscope with great success, and made drawings of the cellular and other tissues of plants. These were engraved for the purpose of illustrating his book, and his readers had practically for the first time an opportunity of studying the structure of the stem, leaf, and fruit of plants. The honeycomb appearance of the cellular tissue proved of special interest to the readers of "The Anatomy of Plants," but it should be mentioned that the resemblance of this tissue to the honeycomb is much closer in the book than in Nature, this being especially marked in the longitudinal section of a young apricot kernel. He died in 1711 in his eighty-third year.

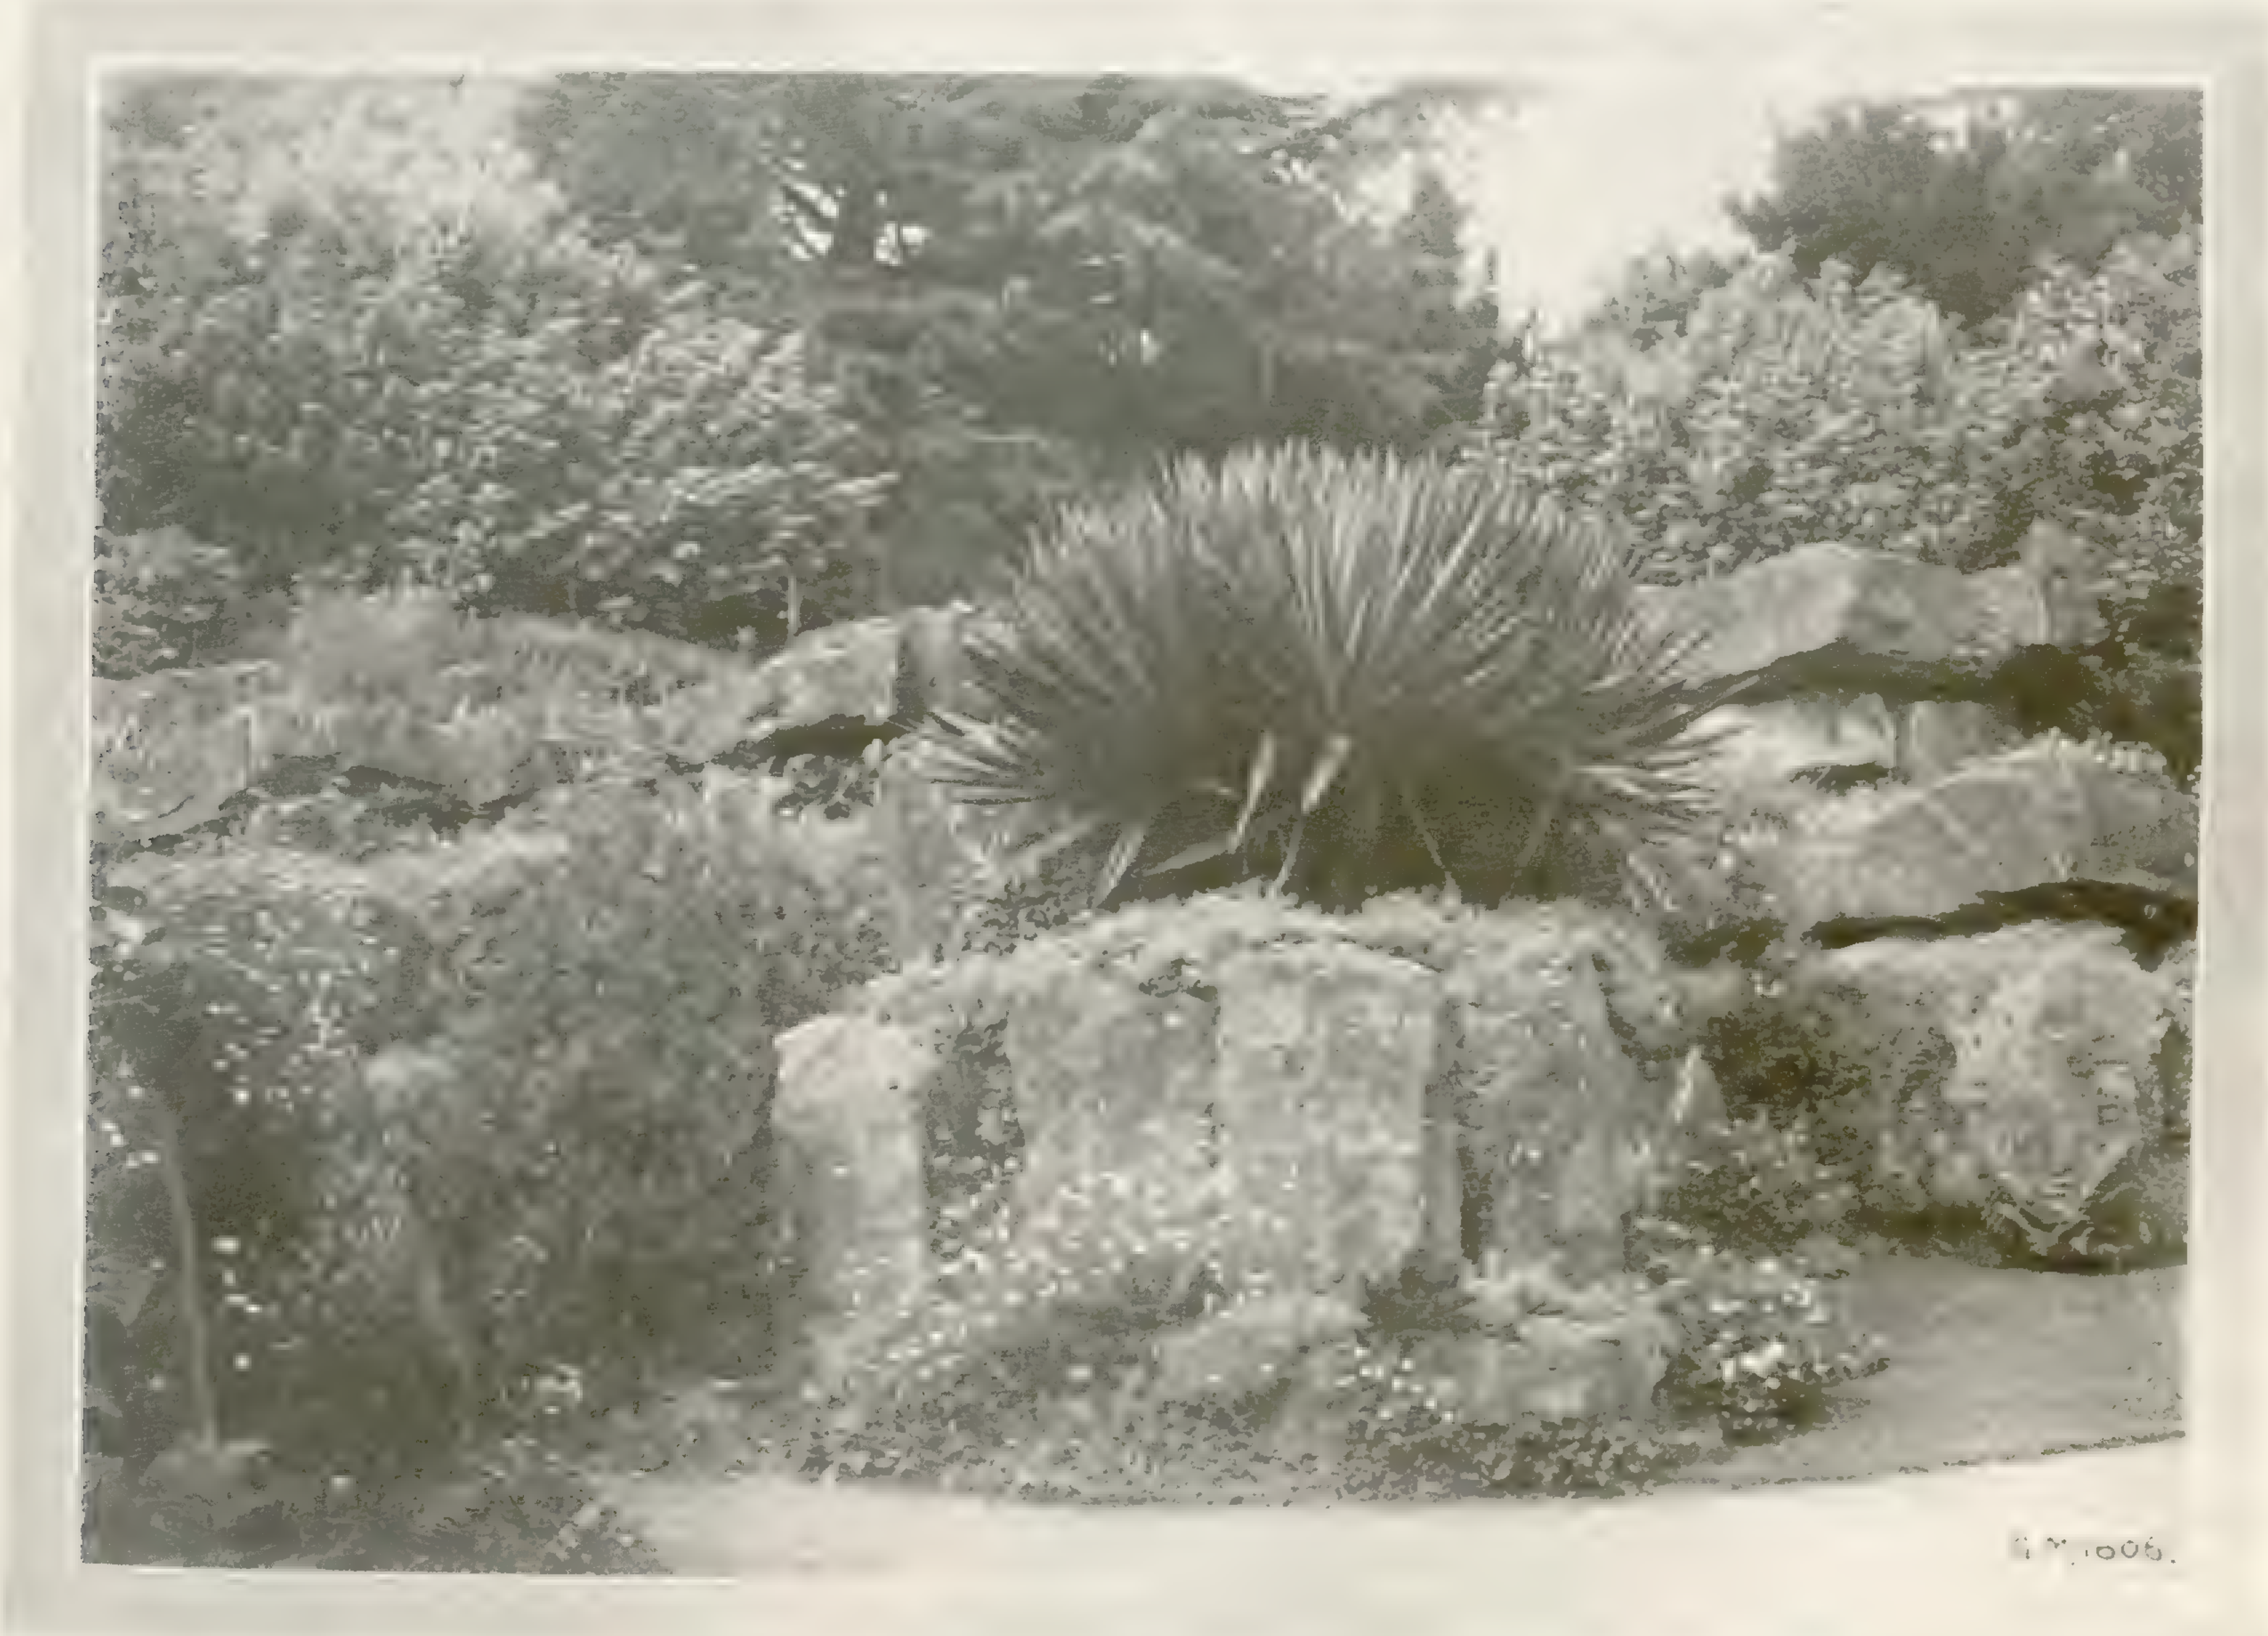
National Chrysanthemum Society. The annual meeting of this society will be held at Carr's Restaurant, 264, Strand, on Monday evening next, at 7 p.m., with Sir Albert Rollit (president) in the chair. The report that will be presented to the meeting is of a satisfactory character. It shows that commendable activity was shown in the conduct of the affairs of the society, that the exhibitions were of a high degree of excellence, and that several interesting and useful trials of single varieties were held. We learn with satisfaction that there was an increase in membership, and the financial position of the society is improving. With regard to the latter, the report states: "The whole of the ordinary liabilities of the society were paid before the books were closed on December 31, 1910. In the early part of the year a sum of £50 was transferred from current account to reserve fund account; and it will be observed from the accounts that at the close of the year a sum of £50 8s. 8d. stood to the credit of the society on current account at the bank. There are other sundry small amounts due for medals and advertisements, and these, together with the various properties at the Crystal Palace and the money at the bank, make the total assets on December 31 last £121 12s. 9d."

North of England Horticultural Society.—The organisation of this newly-constituted society is rapidly approaching completion, and the first meetings of the Scientific, Plant and Floral, and Fruit and Vegetable Committees will be held on Monday next, February 6, at 5 p.m., 6 p.m., and 7 p.m. respectively.

British Gardeners' Association.—At the last meeting of this association held at the R.H.S. Hall, Westminster, 44 new members were elected, bringing the total up to 2,008. An important meeting of the association was held at Birmingham on January 21. Mr. J. Udale presided, and about 90 gardeners attended to hear an address from Mr. J. Weathers, general secretary, and Mr. Raffill. Great enthusiasm was shown, and many present handed in forms of membership. Another meeting will be held at Birmingham on February 18, at the Cobden Café, when the local branch will be reorganised.

BOLD ROCKWORK.

While we have on several occasions made special reference to the fact that the greater proportion of the more beautiful of the alpine plants can be successfully cultivated on rockeries of the most simple description, we have not lost sight of the value of rockwork of bold construction as an aid in the production of scenic effects in the garden, or indeed of its usefulness in displaying the charms of certain plants to the best advantage. So far from this being the case, we have, as opportunities have arisen, described and illustrated some of the more noteworthy of the elaborate rock gardens that have come under our notice within the past few years. In giving prominent attention to the two classes of rockwork here referred to, our object has been to show that those who have gardens of limited size, and are desirous of growing with success plants from alpine regions under conditions of a simple character, may engage in the pleasurable task with the assurance of obtaining satisfactory results. All the alpine plants that have a place in British gardens will thrive in rock gardens of the most elaborate design if they are provided with a soil adapted to their requirements, and are assigned positions that are known to be favourable to their full development. It is not so much a question whether the plants will thrive the most satisfactorily on a simple or an elaborate rockwork, as of adopting a method that has the advantage of simplicity when there are objections to the building of rockeries that involve a considerable outlay, or a difficulty is experienced in providing a suitable site. This last point is of considerable importance, and it should be remembered in connection therewith that, in the case of gardens that are small, and indeed in the case of those of moderate dimensions, special care is necessary in the planning of rockeries possessing boldness to prevent their so predominating in the general scheme as to suggest the want of a proper balance between the several parts.



A VIEW IN THE ROCK GARDEN AT SWAYLANDS HOUSE, TUNBRIDGE WELLS, THE RESIDENCE OF G. J. DRUMMOND, ESQ.

Bold rockwork, and rock gardens in which boldness is a characteristic feature, have their advantages, and should have the fullest consideration when questions relating to the formation of gardens on a comparatively large scale in making additions to old ones are under discussion. Provided the space available is large enough to admit of their being so made as to possess but little, if any, trace of artificiality, they will form a distinct and delightful feature. The bold rockery will be planted in a very different manner to that which is so simple as to be but little more than a series of raised beds, for, instead of being wholly furnished with flowering plants from alpine regions, the subjects used in clothing the slopes should include hardy rock and border plants and trees and shrubs. With care a selection sufficiently comprehensive to produce a series of the most delightful effects and afford abundant interest may be made. As evidence of this we need only refer to the extensive and beautiful rock garden at Swaylands House, Tunbridge Wells, the residence of G. J. Drummond, Esq., which has been created by Mr. R. Hozier, who has long been chief of the important gardens of this charming seat.

This remarkable rock garden has a large area, is situate in one of the lower parts of the extensive grounds, and is so placed that it has been found possible to utilise water in the enhancement of its charms, and is not constantly under observation from the mansion and elsewhere. This is as it should be. Little is seen of the rocks until within a short distance of the garden, and on entering it and proceeding along the walks, visitors have a succession of surprises, and those who do not have also a succession of delights must have a somewhat peculiar temperament. In some parts the walks run through moderately open valleys with gentle slopes on which a host of beautiful plants are at home. In others the walks pass between rocks towering to a great height, and at some points so close together as to necessitate walking in single file. This rock garden was many years in the making, and is remarkable for the huge size of the larger proportion of the blocks of stone used in its construction. It is remarkable also for the skill shown in providing the various subjects with which the slopes are furnished with sufficient soil.

On the slopes and among the rocks trees and shrubs remarkable for the beauty of their flowers, for the distinct colour or form of the leafage, or elegance of habit, have been freely planted, and, as a matter of course, with due regard to general effect. In the more open positions alongside the walks flowering plants of various kinds abound. Higher up arabis, aubrietias, and perennial candytufts have been freely arranged, and spreading over the face of the rocks, these free-growing plants bloom with great profusion and produce in the season of flowering a marvellous display of colour. What has been accomplished at Swaylands House may be carried out in gardens of much smaller size. The rocks have been firmly fixed in position, and with due regard to their presenting a more or less natural appearance. The spaces for the soil are everywhere sufficient to afford an ample root run; trees and shrubs possessing more or less beauty and of moderate size have been selected, and hardy flowers have been planted in the positions adapted to their requirements.

G.

PEAS FOR SMALL GARDENS.

Peas for small gardens should be varieties of the very first quality, and those that grow no higher than four feet. In a small garden one has to utilise the ground so as to secure a full supply of various vegetables. By choosing peas 4ft. high and under the rows can be sown closer together than would be possible with taller varieties. A good guide to sowing is to allow the same distance from row to row as is the height of the variety.

Preparing the Ground.

Good ground work is the chief factor in maintaining a plentiful supply of peas throughout the season. Peas form such an important and favourite crop that no pains should be spared to have the soil in the best possible condition. Peas are deep-rooting subjects; the ground therefore should be trenched during the winter or spring. If heavy, defer the work until the dry, frosty winds arrive early in the year and onwards, leaving the surface in a rough state for the frost and winds to act upon it. Good farmyard manure is the best, digging the coarse or longer manure in the bottom trench, and the best and shorter under the top spit or layer of soil.

It is a great advantage to roughly fork the top soil over again for the weather to sweeten should a dry period follow. This process will take very little time, and the advantage is readily observed in the case with which the drills can be prepared later for sowing.

NEW PEA LANCASTRIAN.
(Messrs. Dickson and Robinson, Cathedral Street, Manchester.)

Sowing the Seeds.

To obtain early peas the first two batches should be sown in boxes. Even if there is only a cold frame at command, it will hasten the crop immensely. Make these two sowings during February, and even another in March, if the weather is unfavourable then for outside sowing. Grow the peas in the frame, and admit plenty of air on all favourable occasions after germination has taken place, finally planting them out during fine weather in March and April.

Early Giant and Early Morn are two excellent varieties for box treatment. When planting them out the soil in the box should be quite moist so that as much as possible remains attached to the roots. The plants can be removed singly, and planted three inches apart, without any harm accruing whatever. If cold weather or cutting winds prevail, protect with boughs or boards set on edge alongside the rows. It is advisable to stake the peas immediately they are planted, and if slugs are troublesome it is a good plan to dust finely-sifted cinder ashes around each row.

Sowings in the open can be made every fortnight from early in March to the middle of June. If the soil is of a retentive nature, burnt garden refuse, or any fine soil that is available, should be in readiness when the drills are drawn to mix with the soil, to cover the seed and to assist future growth. Drills nine inches wide and two inches deep are suitable. Sow rather thickly, and thin the plants just before staking; a fair distance apart would be two inches.

After treatment should be paid strict attention to, particularly for the later sowing, and should consist of regular waterings with soft clear water and liquid manure, syringing on the evenings of hot days. Mulching thoroughly, especially the mid-season and late varieties, using manure, long strawy litter or lawn mowings, which will keep the ground cool, and retain the moisture in the soil.

Varieties.

Well-tried early varieties are Pioneer, 3ft.; Acme, 3½ft.; Early Giant, 3½ft.; Gradus, 4ft.; and Early Morn, 3ft. Mid-season varieties: World's Record, 3ft.; Dwarf Defiance, 3ft.; Model, 4ft.; and Prizewinner, 3ft. Late varieties: Masterpiece, 4½ft.; Autocrat, 4ft.; Sturdy, 3ft.; and Selected Gladstone, 4ft.

G. Ellwood.

Early Melons.—As soon as the roots have touched the sides of the pots some more soil should be prepared and taken into a warm house, and the plants given a shift. The soil should be composed of good fibrous maiden loam mixed with some spent mushroom bed manure.—W. A. Cook.

Spiræas for Forcing.—It is not so very long since that practically the only spiræa employed for forcing purposes was the old Spiræa or Astilbe japonica. Then a dwarfer and more compact form, S. astilbe compacta multiflora by name, made its appearance. It proved, however, to be of too dense a habit to become popular, although it is still grown to a certain extent. About 25 years ago Spiræa astilboides was distributed, and in time crosses between this spiræa and the old A. japonica were put into commerce and soon became favourites. The first was S. astilboides floribunda, and since then others have been sent out, of which Gladstone is one of the best. These hybrids are bolder and looser than the typical A. japonica. The pink forms are wanting in colour when forced early into bloom.—W. T.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

NEW GARDEN PEA FOR 1911.

MASSEY'S RELIANCE, per packet 1s. post free.

Mr. W. A. Cook, Head Gardener to Sir E. G. Loder, Bart., writes: "I am very pleased to inform you it proved a great success, especially as it was such a cold wet time for early peas. Sown on the same day as several other varieties, it was not one day behind, and is equal in bulk to anything I have ever grown. Haulm about three feet, with especially long pods for so early a Pea."

GEO. MASSEY & SONS, Seedsmen, SPALDING.

MARGUERITE CARNATIONS.

The great improvement effected in recent years in the various annual plants, and those treated as annuals, and grown for border decoration and for cutting, is fully evident in the case of the subjects here referred to. Time was, and that not long since, when the flowers of Marguerite carnations were of very undecided tints of colour, borne on weak stems, and a large percentage of them single. All this is changed, and large fragrant blooms, mostly double, well poised on stout stems may now be assured by sowing seeds of a good strain in spring, and giving the attention usually afforded to young plants of very similar character until the time for planting in the open arrives.

Sowing the Seeds.

This may be done from the middle to the end of February in pans or boxes, using as a rooting medium a compost of fibrous loam and leaf-mould in about equal parts, to which a little sand or burnt ashes may be added according to the texture of the former article. The receptacle having the usual perforations at the bottom, may have an inch depth of coarse leaves or moss placed therein, upon which at least two inches of the prepared soil will then be required, to be made level and firm. As germination is almost certain thin distribution of the seed should be practised to obviate the necessity of very early transplanting, also the risk of damping. Cover the seeds lightly, and, if the soil is fairly moist, watering at this season may with advantage be dispensed with for a few days, more especially if the boxes can be placed within a frame upon a gentle hotbed. Moderate heat in all stages of growth is advisable, keeping the plants as near as possible to the glass to induce a sturdy growth, otherwise an undue weakness in the stems will be manifest.

After Treatment.

When large enough to handle with ease, and some degree of speediness, the seedlings may be transferred to other boxes prepared in much the same way as already described, but the soil may be somewhat coarser, and have a small portion of well-broken up lime rubble added; this inclusion will be appreciated and the decay of the stems, owing to frequent waterings, to which the whole carnation family is more or less liable, will be prevented.

When again established, a night temperature of about 50 degrees will be ample, and soon thereafter a position in a pit or frame where frost can be excluded would be better than that of a house. Planting out may usually be done about the middle of May, depending, of course, upon the season; but should the weather, or any other cause arise to prevent this being done, temporary transference from the boxes to an open air site would assist in the formation of root, and avoid congestion of growth and its attendant evils.

The Flowering Quarters.

Being essentially autumn-flowering, wherein lies their chief usefulness, as they commence to bloom just at the time when the border carnations are declining, a position most suitable to a late display should, as far as possible, be chosen. Though well adapted for beds where gladiolus, hyacinthus, or late-flowering lilies find a place, a single row of plants alongside a walk is perhaps to be preferred. Here the growths are able to spread naturally, and the central growths, if thought necessary, can be readily supported by means of a few short stakes inserted at intervals, the connection between being made with slender twine, thus preventing the flowers being dashed and soiled by rain and wind.

Given fair cultural treatment, so abundantly are the flowers and buds produced, that the least developed of the latter may require removal from the sprays if these are wanted for vase decoration, after which the open and partly-opened flowers remaining are in every way beautiful. Flowering continues until severe frost occurs, which last autumn was in the early days of November, and up to that time flowers, wholly unprotected, were plentiful. Colours in mixture have hitherto ruled, but those distinct, as yellow, crimson, and white are now obtainable at a reasonable cost from the leading seed houses, and, as already stated, a good strain of seed should be procured to ensure the best results.

JAMES DAY.

NEW PEA HUNDREDFOLD.
(Messrs. Sutton and Sons, Reading.)

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

FRUIT TREES ON LAWNS.

In a beautiful old garden in a Hampshire town there are apple, pear, and other kinds of fruit trees growing on the lawn. The latter has a gentle incline from the dwelling-house down to a river, and when the fruit trees are in full blossom the scene is a lovely one indeed.

Quite close to this garden there are abbey ruins and a minster church; the old grey division walls, covered in places with lichen, and the old-fashioned flowers growing in the border beneath, all add great beauty to the scene. A looker-on can readily conjure up in his mind's eyes what real old-fashioned gardens looked like.

A portion of an old orchard and fruit garden was added to the lawn in question, and only the small bush fruits were discarded. The standard apples and pears, and even several espalier trees were allowed to remain, and when the ground had been duly levelled turf was laid down. It is a quite unique sight to see the espalier fruit trees almost in the centre of the lawn.

I have often advocated the planting of fruit trees on a lawn. Of course, there are very few gardens that lend themselves to the planting of fruit trees as the one above referred to does; but there are many lawns that would be improved, and become more interesting if a few fruit trees were judiciously planted on them. Not only are such trees lovely and interesting during their flowering period, but they are equally so in the autumn when the fruits are ripening and the leaves assuming their various autumnal tints. The grass should be eventually allowed to grow right up to the stems of the trees as it is in the case of other kinds, both deciduous and evergreen.

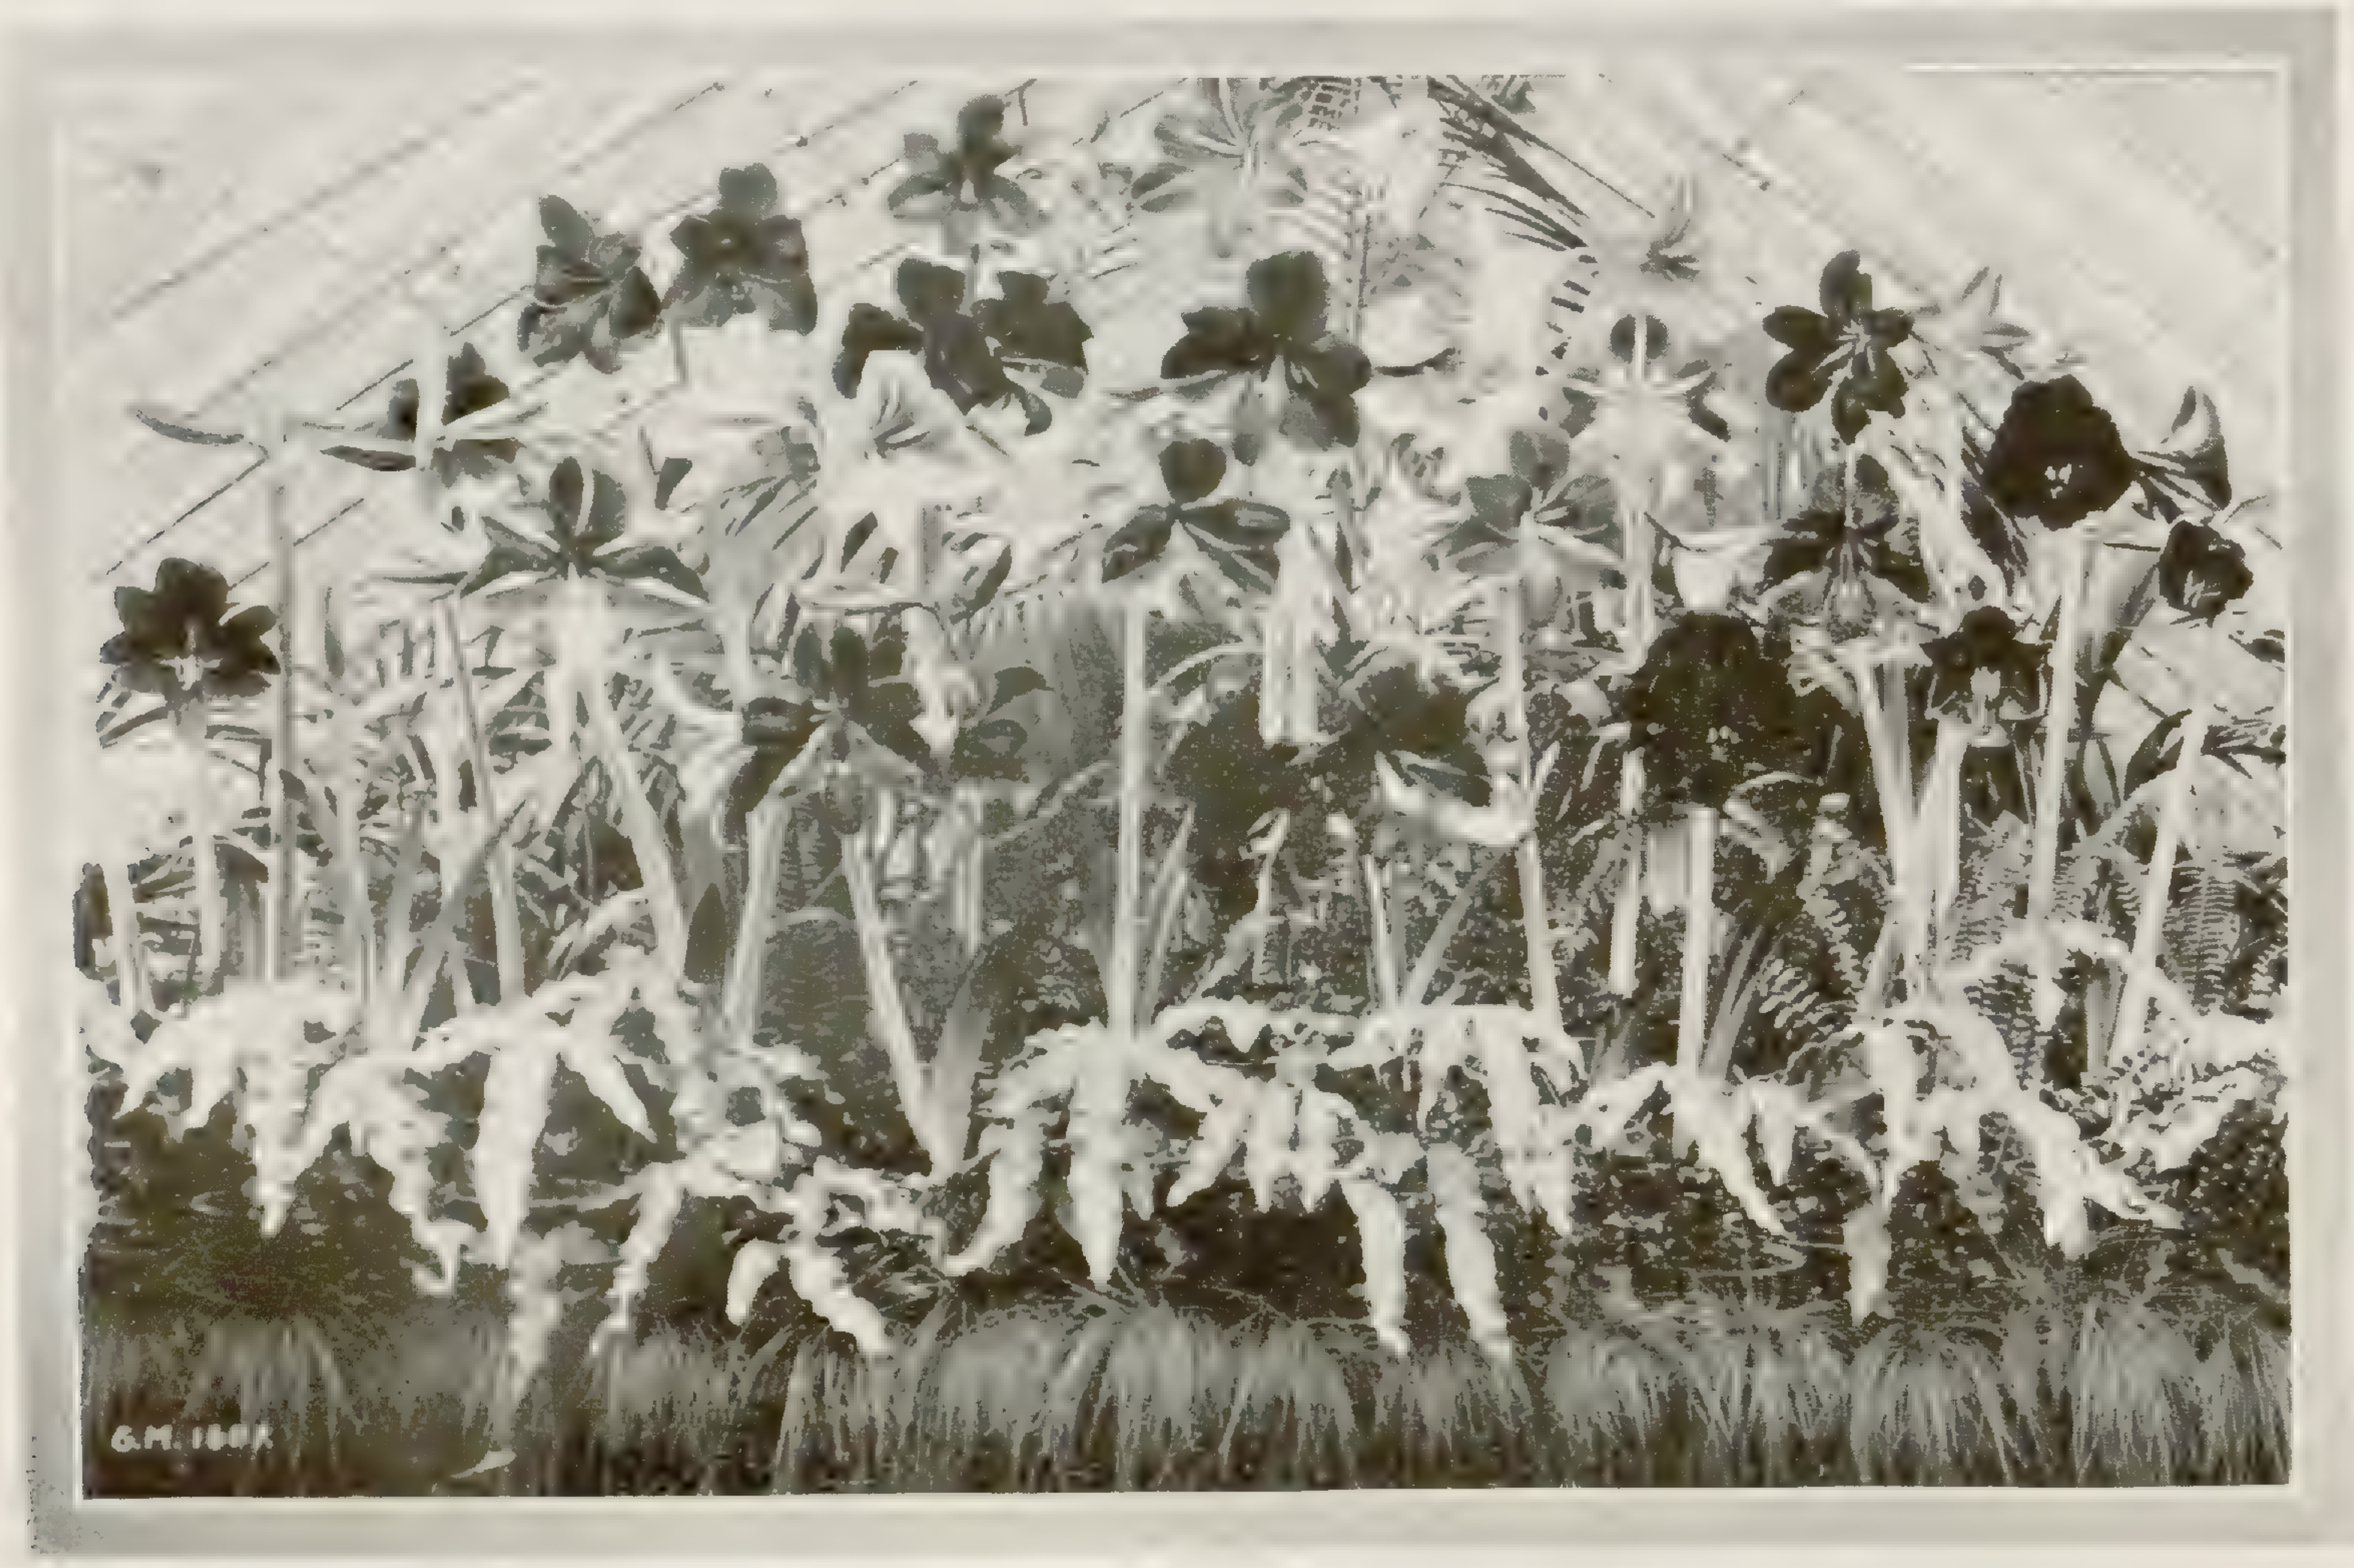
The following kinds and varieties of fruit trees are suitable to plant.

Apples.—Hoary Morning, the fruits are large, bright red, and streaked, and look very nice in the autumn. Devonshire Quarrenden is another good variety for our purpose; its fruits are very showy on the trees, being dark red, and are seen at their best during September and the early part of October. Barnack Beauty makes a perfect standard, and its fruits are very richly coloured on one side. Keswick Codlin must also be included, as it grows freely, and bears abundantly in almost any kind of soil. Red Astrachan bears early fruits, and they are of a rich scarlet colour and most effective. **Pears.**—Jargonelle, Pitmaston Duchess, Marie Louise d'Uccle, Hessle, Swan's Egg, and Williams' Bon Chretien. **Plums.**—Kirke's, Jefferson; and damsons, walnuts, quinces, cherries, medlars, and mulberries should also be planted.

GEORGE GARNER.

HIPPEASTRUMS AT CHRISTMAS.

Hippeastrums are undoubtedly amongst our most showy bulbous plants, and at the festive season of the year they will be found exceptionally useful, as brightly-coloured flowers are so much in demand at that time.



A MIDWINTER GROUP OF HIPPEASTRUMS (AMARYLLIS).

The accompanying illustration is from a photograph taken in Christmas week, 1910, and represents part of a batch of seedlings, most of them flowering for the second time, and they are the result of one cross, between a light and dark variety, and vary considerably both in colour, width of petal, and size, the flowers ranging from 8 to 10 inches in diameter, while some of the stems are 30 inches in length.

As the months of March and April form the usual flowering season of these plants, a few notes on the methods followed by which those illustrated were had in flower earlier, may interest your readers.

Hippeastrums are not at all fastidious, and no one should hesitate to grow them because they lack a special house, tan bed, bottom heat, etc. Personally, I believe they are often given too much heat, and are ripened, or dried off, far more than is necessary or good for them, and so fail to give such good results as they otherwise would do. Many gardeners prefer to pot the bulbs directly the flower spikes show themselves, but in the case of the batch in question, the bulbs were shaken out, and repotted immediately after flowering, my experience being that the flowers do not develop so well if the bulbs are disturbed just before flowering.

The compost used was of a loamy nature, containing a sprinkling of artificial manure, great care being taken to work the soil among the large fleshy roots. The plants were then grown in a light, airy house, where a temperature of 60 deg. was maintained as nearly as circumstances would permit, good sturdy growth being made. At the end of May, the house being required for tomatoes, the hippeastrums were moved to a cold frame, where they remained until the end of October; the frame was unshaded, and during the warmer months, air was admitted night and day. During the last few weeks they were in the frame the water supply was gradually decreased, and the plants were then placed in a cool house, near the pipes, behind chrysanthemums, in fact, and still kept rather dry; water was, however, given occasionally to prevent shrivelling.

Here the spikes soon began to show themselves, and, as they did so, the plants were removed to a warmer house, and placed in a light position near the glass, where they quickly developed, being assisted with weak liquid manure.

During Christmas week when the photograph was taken, about a third of the batch was already over, and the remainder will probably keep up a succession of blooms until February is well advanced.

W. J. JENNINGS.

Salvia Patens.—Tubers should be placed in a warm temperature to produce growths for propagating. Potting is the most suitable plan to adopt, for when sufficient cuttings have been obtained the old plants may be placed in a cooler house, and will serve for planting out again.—E. C. POOLEY.

UNRELIABLE ROSES.

There are a considerable number of roses that are not reliable enough for general cultivation, and thus frequently cause disappointment when planted. Unfortunately, several of these are really good at times, while others are very indifferent growers. The intense colour and grand form of some hybrid perpetuals tempts a second trial after failure. But as we can have really trustworthy varieties of almost equal merit in other respects, it is folly for the average grower to try those that are uncertain. It is my object to name a few that cannot be depended upon in this class. I do not wish to say they are always disappointing, because in some positions and instances these same varieties have succeeded in a surprising manner, but they are uncertain. The intensity of colour in A. K. Williams, Duchess of Bedford, Dr. Sewell, Comtesse de Ludre, Horace Vernet, Xavier Olibo, and Louis Van Houtte is very captivating in the exhibitor's stand, and also when we occasionally have the fortune to have one upon our own plants; but they cannot be depended upon, and have no place in the everyday rose garden. Among the Hybrid Teas we have Lady Mary Fitzwilliam, White Lady, Mildred Grant, Edith D'ombrain, Robert Scott, and Papa Lambert that come under the same category. In Teas and Noisettes there are Cleopatra, Ivory, Golden Gate, Ma Capucine, Comtesse de Nadaillac, Niphetos, and Sunrise that are far from dependable in the open.

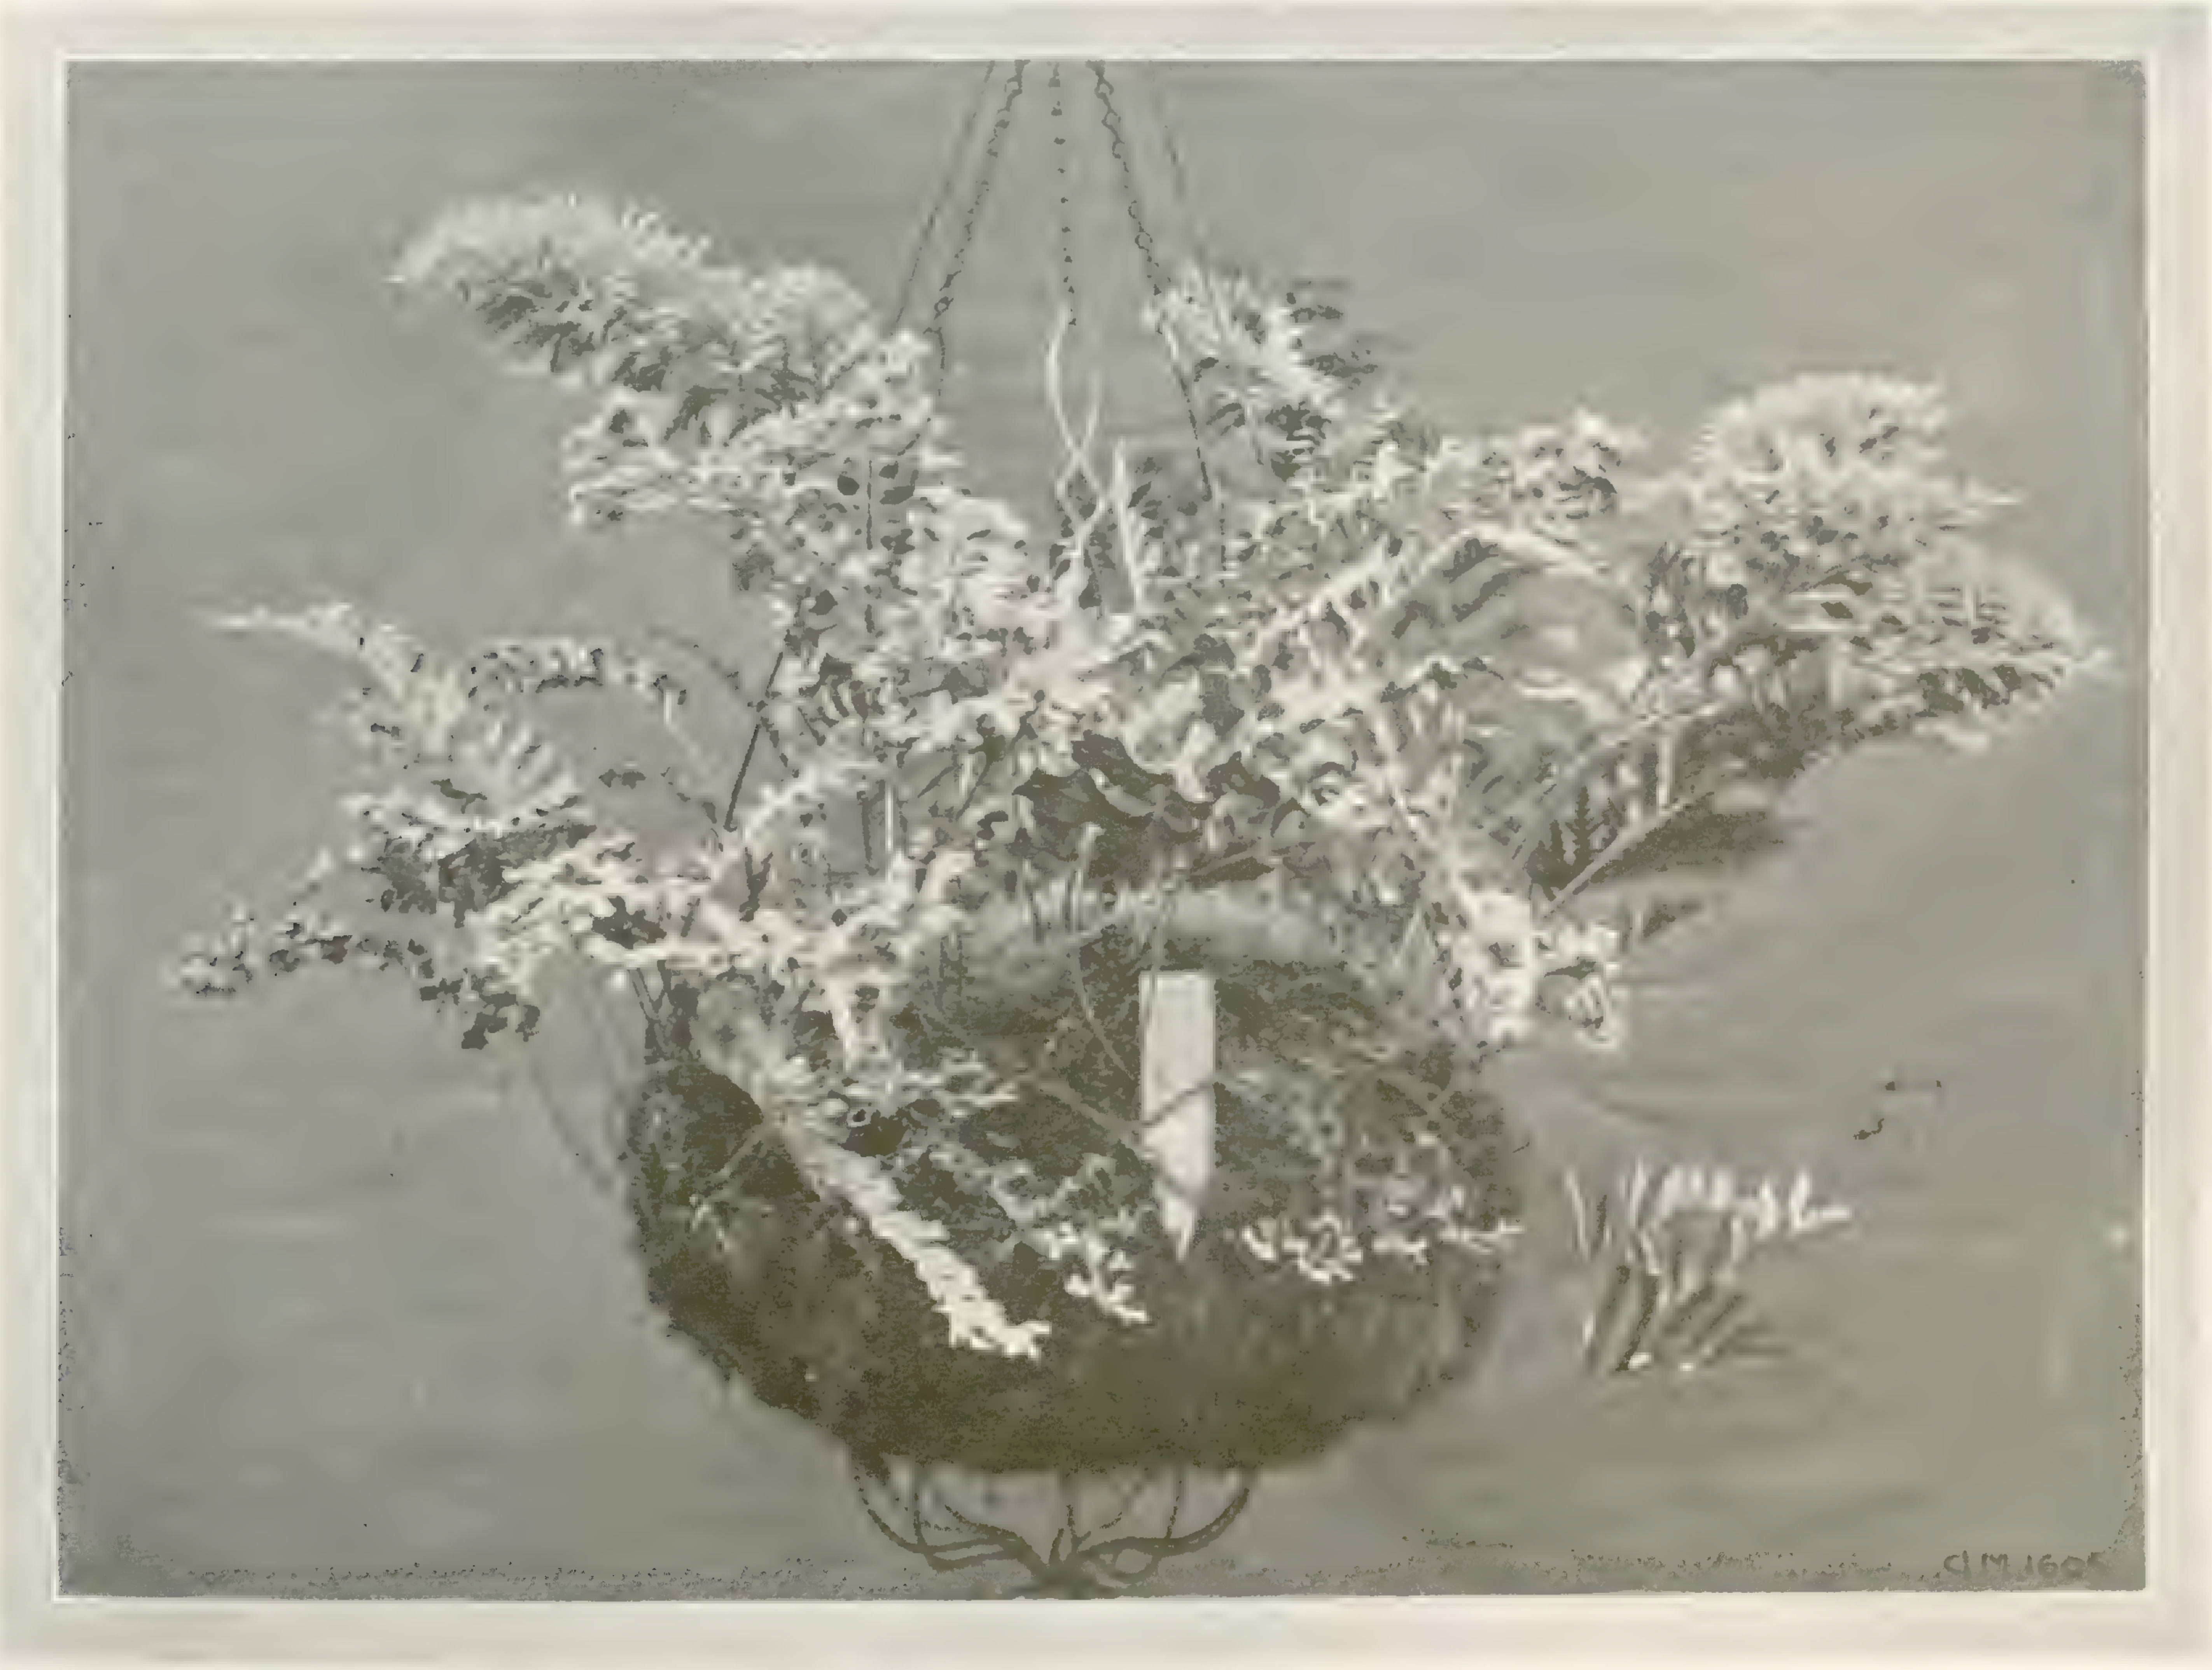
These are beautiful roses, and I do not wish to decry them, but they have caused much disappointment to amateur growers who have seen them at their best at the various exhibitions.

Fortunately, we have heaps of varieties that cannot fail to please, and are as reliable as any other flowering shrub; but we need know a little more about the behaviour of roses before planting, and few catalogues can give fuller information than they do already; hence this warning note.

A. Piper.

POLYPODIUM VULGARE AS A BASKET PLANT.

Herewith I send you a photograph kindly supplied by my neighbour, Mr. C. B. Green, of a group of varieties of the Common Polypody, which, to those who are only familiar with the common form, will probably constitute a revelation. A glance at this basket group suffices to show very wide variation between the forms, some being heavily tasselled, and others very much divided. Among them are P. v. pulcherrimum, the bold divided variety to the upper left and right; P. v. grandiceps Forster, and bifidi-multifidum, lower left and centre, amid which are mingled but somewhat masked, the curious form known as P. v. glomeratum Mullins, no two fronds of which are alike. Projecting lower down to the right are seen fronds of my Killarney form P. v. longipinnatum, and these five really constitute the group.



VARIETIES OF POLYPODIUM VULGARE GROUPED IN A SUSPENDED BASKET.

The size of the fronds may be judged by the fact that the basket is 15 inches wide. The group was installed in soil packed in a lining of moss, some seven or eight years ago at least, and has been mulched from time to time with fresh leaf-mould, but otherwise left undisturbed, and, as will be seen from the creeping root-stocks originally planted on the top, have made their way downwards through the moss, and sent out fronds laterally as well as upwards, to very fine effect. Care, of course, is taken to prevent drought, by frequent supplies of water, but it is happily a characteristic of this species that accidental droughty conditions do no harm, and entire recovery resulting when a thorough watering is subsequently given. The polypody is a denizen of old walls, and has become evolved to withstand the risks of drought thus incurred. The compost used was leaf-mould mainly mixed with some loam and plenty of sand.

A parallel basket might be filled with other varieties of equal beauty, say, with the several forms of P. v. cambricum, the ordinary form, and Prestoni, Burrowi, and Hadwini, while P. v. elegantissimum alone would make a fine specimen when well established, as would any one of the varieties mentioned if strong plants are used to begin with, and proper planting and treatment afforded. It may, indeed, safely be said that no fern is better adapted for basket treatment than this. It is perfectly evergreen, the fronds remaining verdant through the winter, and until the new ones are well in evidence; some of the varieties, too, usually grow very late in the season, July, or even August, and these extend the growing season for several months as a consequence.

The creeping root-stocks should not be embedded deep when planting, since they seek the surface, over which they creep, so as to form dense masses. A few pieces, however, may be packed close to the moss laterally, through which they will push their way, and so hasten the ball formation which adds to the beauty of the group. Copper wire is preferable to galvanised wire, as the latter oxydises, and oxide of zinc is detrimental. Strong suspending wires or chains are necessary, as the weight is considerable; the hooks on which the baskets are suspended must also be stout. With these precautions and preparations and a little care in watering a group of baskets in an unheated conservatory may be made an attractive feature.

Chas. T. Druery, V.M.H., F.L.S.

PEAS FROM JUNE TO OCTOBER.

Peas, when presented at their best, are highly prized. Consequently every pains should be taken to provide an unbroken supply over as long a period as possible, and when all details are considered, there is little difficulty in this matter under ordinary circumstances. Few vegetables have been improved more during recent years, and there are now so many varieties—both early, mid-season, and late—suitable for various parts of the country, that I see no reason why so many of the old and very poor sorts should be sold and cultivated, because as much trouble is incurred in cultivating these as with the better varieties. We seldom have peas at hotels, restaurants, and public dinners of that fine quality which we are in the habit of having at home.

NEW PEA WEBBS' NEW LEADER.
(Messrs. E. Webb and Sons, Wordsley, Stourbridge.)

Preparation of the Land.

This is a very important matter, and must be faced if the best results are to be expected; and here let me point out that there is no soil that I am acquainted with which cannot, when properly cultivated, produce peas in the highest state of perfection. The first item to observe is that the ground must at all costs be deeply broken up, either by a proper system of trenching, or preparing deep trenches, much in the same way as is generally advised for celery culture. For all early and mid-season peas I much prefer trenching the ground to the depth of from 2ft. 6in. to 3ft. during the winter months, and I am fully convinced that the subsoil should be brought to the surface, working in at the same time a dressing of good farmyard manure, placing part at the bottom of the trench, and another part in the middle. Burnt garden refuse is one of the finest additions one can possibly make, and should be strewn over the surface after the trenching is completed. When this work should be carried out will depend to a large extent as to the nature of the soil. On light, porous land I prefer the autumn; but for that of a heavy, retentive nature January and February provide, in my opinion, the best time. No attempt should be made to break down the material taken from the bottom, as this may safely be left to the beneficial effects of the weather which we experience during the early spring months. When the sowing or planting time arrives lightly fork over, and break down the surface.

For successional sowings which are intended to give results during August, September, and October, good trenches should be prepared during the early spring months and filled in with good half-decayed manure, placing sufficient soil over the same in a rough condition, and leaving it until the sowing period arrives. Peas resent being grown on the same site two seasons in succession, and one should always endeavour to choose a fresh position, and allow at least two or three seasons to elapse, is possible, before again growing peas in the same quarter.

Raising the Seedlings.

I am a strong advocate, and have been for many years, of sowing peas in boxes or some other suitable receptacle, raising them under glass in a cool house, pit, or frame, thoroughly hardening them off, and planting them out when about three inches in height. If this work is carefully performed no serious injury will result; but, on the other hand, I have found, when treated in this way, the plants come into bearing earlier, and the results are generally much more satisfactory than when the seeds are sown in the open. In addition to this, one has the seed under much better control, and can combat the many enemies which so frequently attack and do serious damage, both to the seed and the plant, when in a quite young state. Almost any moderately light compost will be suitable for raising the young plants in. Ordinary seed-boxes may be used which should be well drained, and the seed sown carefully and regularly. Avoid sowing and planting too thickly. I am fully convinced that there are more failures and partial failures due to overcrowding this crop than from any other cause, though this is a common mistake, made not only by the amateurs, but by those who are entrusted with the seed sowing in many private gardens.

Planting and Sowing.

This work should be undertaken when the weather is favourable, choosing a dry day if possible. On many kinds of land it will be necessary, and the work will be much more easily and satisfactorily carried out, if light boards are employed for walking on. It will be found a capital plan to remove about three inches of the surface soil, about six inches in width, and place it on either side of the row. This will afford the young plant some slight protection, as well as assist them in keeping an erect position. The staking should be carried out at the same time, and some means must be taken to protect the plants against the ravages of birds, as if these once attack them the growths are never as good. Not only is overcrowding detrimental in the rows, but if the rows are too close together the same defect follows; so as far as possible, except for the earlier and dwarfer kinds, the rows should be wide apart, cultivating other crops between them.

Watering and Mulching.

During spells of drought the value of mulching can hardly be overestimated, and I much prefer long stable litter to anything else I know of for this purpose. This is equally valuable both on light and heavy soils. Watering, too, is of the utmost importance, giving both clear water and liquid manure properly diluted, and during wet, showery weather some approved vegetable manure should be applied as per instructions given with it. On hot days the growth should be syringed in the early evening with tepid water.

It will be sometimes necessary, to induce the crop to mature more quickly, to pinch out the points of growth when a fair crop is assured. This will make many days difference.

Sowings should be made at intervals of about ten days or a fortnight till the end of June, and in some localities till the middle of July; but it will be found that when the plants are allowed sufficient room and plenty of good rooting material, the later-sown varieties will continue to yield over a very long period. Mildew is frequently the cause of unsatisfactory results among late varieties. This, of course, as is well-known, is due to many causes, but the principal one is insufficient moisture at the roots. Some varieties are much more prone to it than others.

The most common pests in relation to peas are rats, mice, birds, slugs, thrips, and mildew; a fairly good list, which goes to prove that peas are appreciated by other than human beings. Means must be taken to prevent serious damage being done, both in the earlier and later stages.

Varieties.

The long lists of varieties are indeed a puzzle to many, and more especially to the inexperienced. Nearly all the seed vendors have a particular variety or varieties they strongly recommend, and there are far too many peas catalogued, though, as I have often said, some varieties fail in one district where others can be relied upon. There are some standard varieties which may safely be recommended for any locality and that are known to possess good constitution, freedom, and, above all, first-rate quality when cooked.

For early supplies I advise either Early Giant, Early Morn, or Edwin Beckett, all improved varieties of the Gradus type. For succession and mid-season, Duke of Albany, Prodigy, and Quite Content, are hard to beat; while for late use, Autocrat (one of the finest peas ever raised), Masterpiece, and Gladstone, are all good. The latter does much better in the North than in the South, and in my opinion, though the pods are very fine, the quality of the peas is not so high as in Autocrat. I do not favour the very dwarf kinds for large gardens, except for frame culture.

E. Beckett.

A ROCK GARDEN NOTE.

Any contemplated addition or alteration in this department should be at once to allow the stones and soil to become properly settled before planting time. In carrying out the work of extension the style of the existing rockery should be strictly adhered to, and the same kind of stones ought to be used. Above all things avoid the practice of mixing old roots or tree stumps with the stones. In a few years time they form a mass of decaying matter, and a harbour for mice, snails, etc. The habits and requirements of the various plants which are to be grown must be borne in mind as the work proceeds. By deciding the question of what is to be planted in each "pocket," crevice, or slope, suitable soils may be used as the stones are placed in position, thus: For ramondias peat will have to be well rammed in between the rocks; the same for Haberlea rhodopensis, ericas, alpine rhododendrons, etc. Most of the dianthus require plenty of old mortar rubble mixed with the soil, and so on. It is far easier to fill in the necessary soils in the first place than to leave this until building is completed. In most cases there is a better facility for working the soil in thoroughly from the back than from the front, and no places are left vacant. It is absolutely imperative for the welfare of the plants that the work should be well done in the first place. Although so hardy, many of the choice rock garden plants are most particular, both as to position as well as soil, and require places specially made to accommodate them. In most instances anything approaching a rich soil should be avoided, as it only induces gross growth, which, in our damp humid autumns becomes so tender that it cannot stand a severe winter. The setting, or background, must be judiciously planted with choice conifers and flowering shrubs, as well as ornamental foliage shrubs. Nothing rank growing and gross feeding should be used, or the roots will rob the plants of all nourishment.

E. C. Pooley.

THE BEST WHITE PERPETUAL CARNATION.

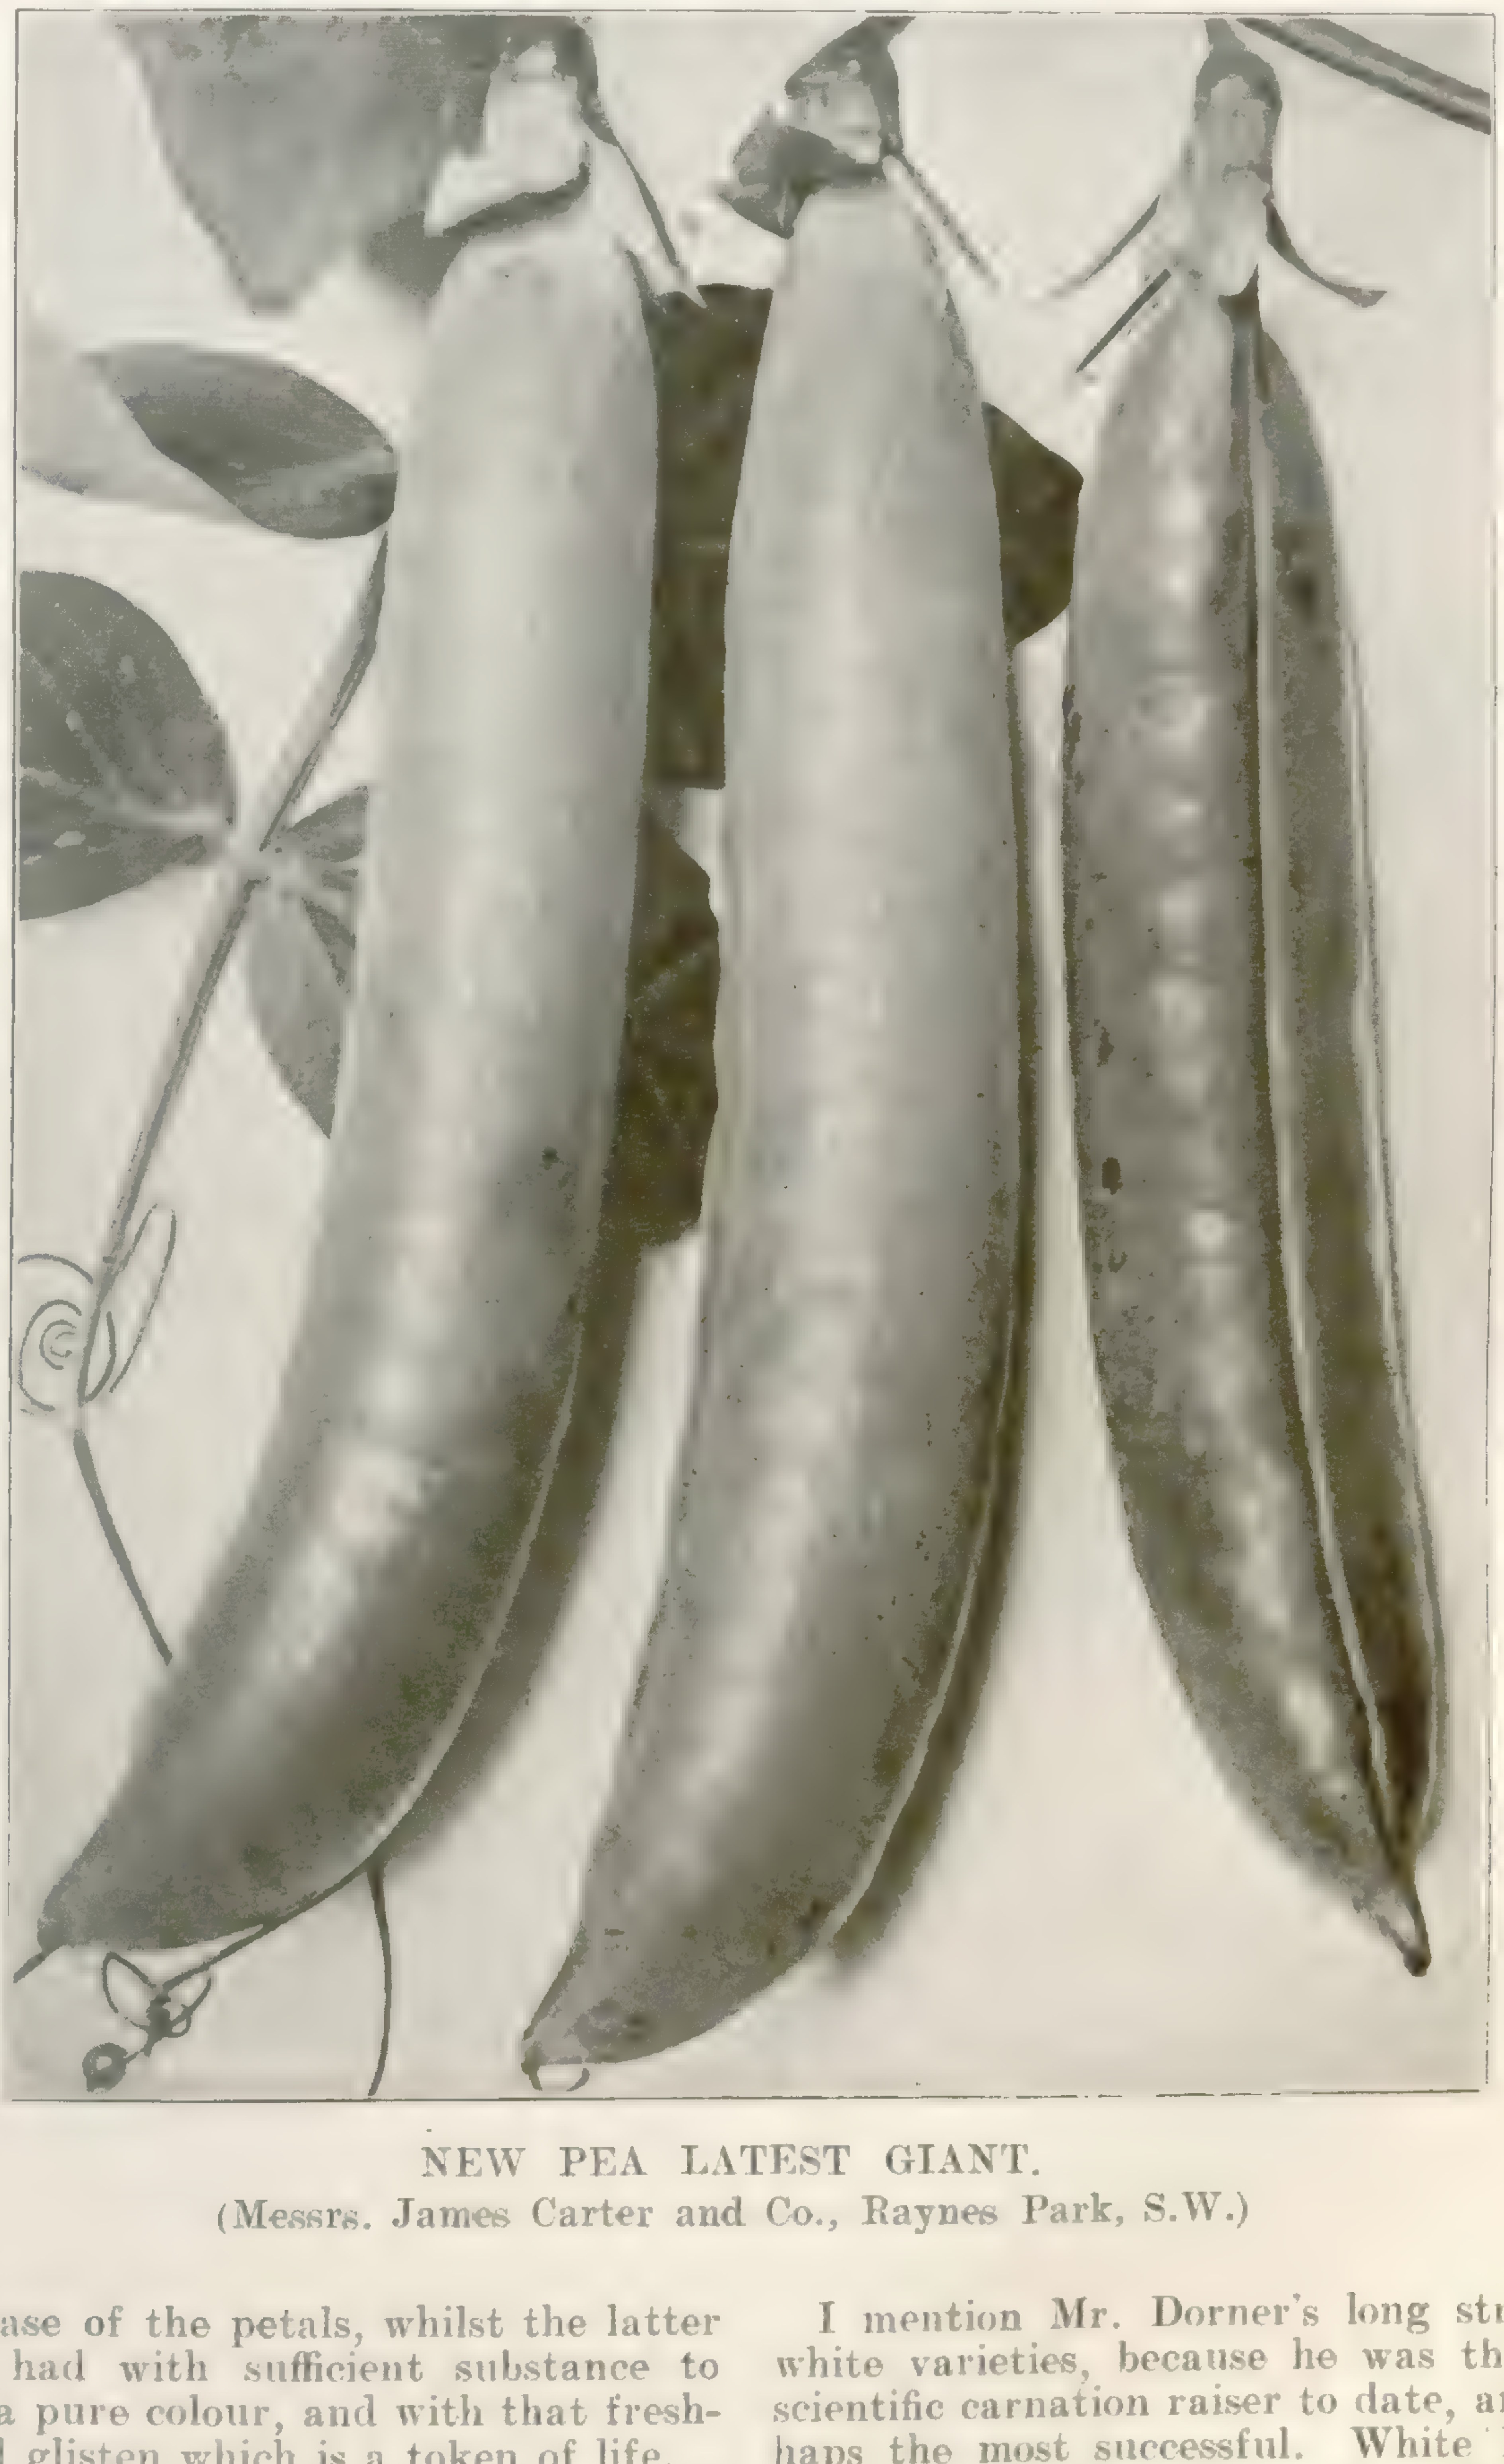
A pure white flower, without shade or shadow, that solid purity, without even the suggestion of any colour, is indeed seldom found in a flower.

Every raiser, no matter what his object may be, is striving earnestly to obtain this prize, this triumph of our craft which is as illusive as a will-of-the-wisp, always in view but never to hand. Few flowers are absolutely white, in fact it is questionable if certain flowers can ever be made to answer that description. But this is not the case with the carnation. There is no yellow throat to conquer, no foreign colour at the base of the petals, whilst the latter can be had with sufficient substance to display a pure colour, and with that freshness and glisten which is a token of life.

The only absolutely pure white perpetual carnation that I know of, and is in commerce to-day, is White Perfection. All too many of our white varieties lack substance in their petals, and lean towards transparency rather than solid whiteness, but even our floral committees apparently fail to recognise this.

I believe that no absolutely pure white carnation can be obtained by any other than scientific methods. Crosses made between coloured varieties do invariably produce white seedlings, but, as I say, not absolutely pure white. The late Mr. Frederic Dorner, whom his many American friends used to love to call "Father" Dorner, is the man who, in 1891, gave the world "White Wings," and climbed up the ladder of success by introducing such grand old-time varieties as White Dove, Sea Gull, Storm King, and White Cloud, that beautiful variety which many will still remember. Then came The Belle, Lady Bountiful, and his crowning triumph, White Perfection; and then, this season, White Wonder, a seedling from White Perfection, which is being disseminated in America by his firm. This, we hope, will do justice to its raiser, who was really a great man, and one worthy of our highest praise.

I mention Mr. Dorner's long string of white varieties, because he was the most scientific carnation raiser to date, and perhaps the most successful. White Perfection is the result of 15 years' work with a set object along definite lines, and it is the direct descendant of White Cloud, which itself once created a standard, and which has some ten white seedlings forming its genealogical tree. That is how White Perfection is the truest and purest white. But colour and form of flower do not constitute everything in the make-up of a first-class perpetual carnation, even if that is the case in the rose, sweet pea, border carnation, etc. We must have freedom of habit, and a plant which grows



NEW PEA LATEST GIANT.
(Messrs. James Carter and Co., Raynes Park, S.W.)

equally well in winter and summer. The colour of flower also must come bright and true under these two extremes, and there are many other points.

So, everything considered, which is the best all-round white perpetual carnation? In the first place, we do not consider such old varieties as Mrs. S. J. Brooks, Queen Louise, The Belle, Lilian Pond, White Lawson, Lieut. Peary, etc.: while of the more recent introductions, Lloyd, President Seely, My Maryland, Mrs. J. C. Vaughan, and Marquis Georgia, are, in the words of the American, "down and out." Lady Bountiful was good and of beautiful form; the colour, however, often had a pink cast or flake, and with the raising of the standard the Lady has proved to be not Bountiful enough, but we appreciate the long term of office she served.

Sarah A. Hill is not a market grower's carnation, because it is not sufficiently free flowering, but it has size, and also a most refreshing scent. The growth is also healthy and strong, and well adapted for pot culture, and it is one which should suit many private growers.

Shasta was sent out in America last season and well received, whilst our own societies have honoured it, but it is not a variety to are enthusiastic over, and, at the shows, it does not appeal to the crowd. The habit is strong, and said to be free. The flowers are deeply fringed and of medium size, but I do not think Shasta will last long in commerce.

Niagara is of good form with rounded petals, but it lacks substance, and while it may be, and indeed is, a good all-round carnation, yet I do not believe Niagara will be grown by many three years hence.

So we have narrowed our list down. We have but White Perfection and White Enchantress, and these do not require introduction to many. I consider White Perfection the best variety for quality of flower, and it is well named "Perfection" in that respect, but the habit of growth is not wholly suitable for pot cultivation, being rather thin. If I could only grow one white variety, I should cultivate White Enchantress as the best all-round white for quantity and quality combined, but it would be necessary to have a good strain of the pure white stock and to grow it cool in a light, airy position, and then it would be quite good enough.

I have not mentioned the new aspirants to fame—White House, White Wonder, and Marchioness of Linlithgow, because I am not in a position to write with equal authority on all three, but I rejoice to think that we have such excellent novelties to select from, and we shall see which of these can stand the test of time.

NEW CULINARY PEA NEWTONIAN.
(Messrs. Dicksons, Chester.)

EARLY SPRING PROTECTION FOR FRUIT BUSHES.

The mild weather of the autumn and winter months is now manifesting itself by the early growth of spring blooming plants. On January 11 Adonis amurensis was nicely in bloom in the rock garden at Westgarth, Pine Walk, Prenton, Cheshire, the residence of F. Thomas, Esq. Snowdrops, too, had been in flower for some time then, and other heralds of spring were in evidence all round. Among shrubs ribes and roses were pushing their growths, the former almost bursting into flower. In fact, everything seemed quite a month before its time. Should the weather continue to be favourable to the development of growth, and our hardy fruit trees and bushes come into bloom a month before their usual time, it is questionable if the grand prospects of a fruit crop this year will be realised.

Very little can be done to retard the blossoming of fruit trees, but perhaps bushes could be helped by leaving them unpruned as long as possible. These, like roses, naturally start at the end of the previous year's wood, so that if they started into growth, and a frost followed, damaging these growths, there is the chance of saving the buds nearer the base of the shoots. In sheltered spots loose straw mixed with the growths would afford a certain amount of protection, and spruce branches on a strong frame of posts and spars would make a good guard against both frosts and cold cutting winds in the more exposed positions. If necessary, these could be left standing till the likelihood of damage from this source was past. As the leaves wither and drop off by degrees the plants would become gradually exposed to the elements and be less liable to suffer from the removal of this protection than from a covering of any closely-woven material.

Of course, much depends on the kind of weather we may have from now till the end of February, as to the early blooming of our fruit bushes, but there can be no harm in being prepared to meet an unprecedented early spring with appliances to at least mitigate the damage, if not to entirely avert it, and I have found the above materials and bracken very useful for this purpose. X. Y. Z.

The Bulbous Fumitory.—There are some flowers which we cannot well place in the first rank, and such is Corydalis bulbosa, also known as C. solida, and in addition as Fumaria. Yet, although not in the premier rank, it has some beauty, and is, I think, a flower which those who are acquainted with hardly care to be without, although they may not consider it valuable enough to put in a prominent place. Yet it is pleasing with its prettily shaped leaves and its clusters of rather dull purplish flowers. These are very numerous, and repay examination because of their shape and the beauty of their form. It only grows from four to six inches high, while it will flourish in both sun and shade, thus affording a pretty plant for some places which are not easily made interesting in April, when it usually flowers. It can be grown in the open parts of the woods and the shrubberies, on rockeries, and in borders. It likes a fairly good and open soil, but will content itself in most gardens with the common fare. It is increased by division, best performed as soon as the plant goes to rest.—S. A.

SOME OF THE NEWER CULINARY PEAS.

It is always an excellent plan, wherever there is available space, to test a few novelties each year. They may or may not be an advance upon standard varieties already grown, but this can only be determined by trial. It may be that among novelties in culinary peas one or more may be especially suitable for our own garden soil and situation, may come into use at a specially desirable time, or may possess hardiness, free cropping, and continuity beyond the common. It must be remembered that some varieties of peas do better in certain districts than in others, and there is always a possibility that one of the novelties tested may prove eminently serviceable. In any case, so great is the care taken in raising and selecting new varieties, there is no risk of loss of crop. The following varieties are all worth consideration.

Hundredfold: A dwarf first early variety that grows about 2ft. high and crops freely. It secured an Award of Merit for Messrs. Sutton and Sons from the Royal Horticultural Society on June 30, 1910. Though of small growth this variety bears pods and peas of the largest size. Lancastrian: A maincrop pea of unusual merit that has been well tested by Messrs. Dickson and Robinson, Cathedral Street, Manchester, in their trial grounds, where it was grown under the provisional title of New Cross. It grows 3½ft. high, and its fine handsome pods carry from eight to ten large, rich green, finely flavoured peas. Webbs' New Leader is a first early variety of great merit. It grows about 3ft. to 3½ft. high and for a first-early variety it produces pods of great size, these containing from eight to ten large peas of fine colour and delicious flavour. Its high quality for table use, together with its splendid appearance for the earlier exhibitions make this introduction from Messrs. E. Webb and Sons highly desirable. Newtonian: Messrs. Dicksons, Chester, who offer this new early maincrop pea, claim for the variety that it is an extraordinary cropper. Its fine large pods contain ten or a dozen large peas of excellent flavour, so that for table or for exhibition purposes it is a fine addition. Height, 4ft. Messrs. Harrison and Sons, of Leicester, who have sent out many splendid new vegetables, are offering a very fine new culinary pea named Lord Leicester. This is a cross between Gradus and Stratagem; it has the growth of the former, and is about 4ft. high, but carries large pods, seven inches long, well filled with large peas that are of grand flavour and colour. This maincrop variety is first-rate alike for table and exhibition purposes. Among the latest of Maincrop varieties Messrs. Jas. Carter and Co. have a novelty in Latest Giant, an exceedingly promising variety obtained by crossing Gladstone with Exhibition. The cross was made in 1903, and since then rigid selection has perfected its fine qualities while severe tests have proved its worth. It grows 4ft. high, and its large, well-filled pods yield peas of the highest quality.

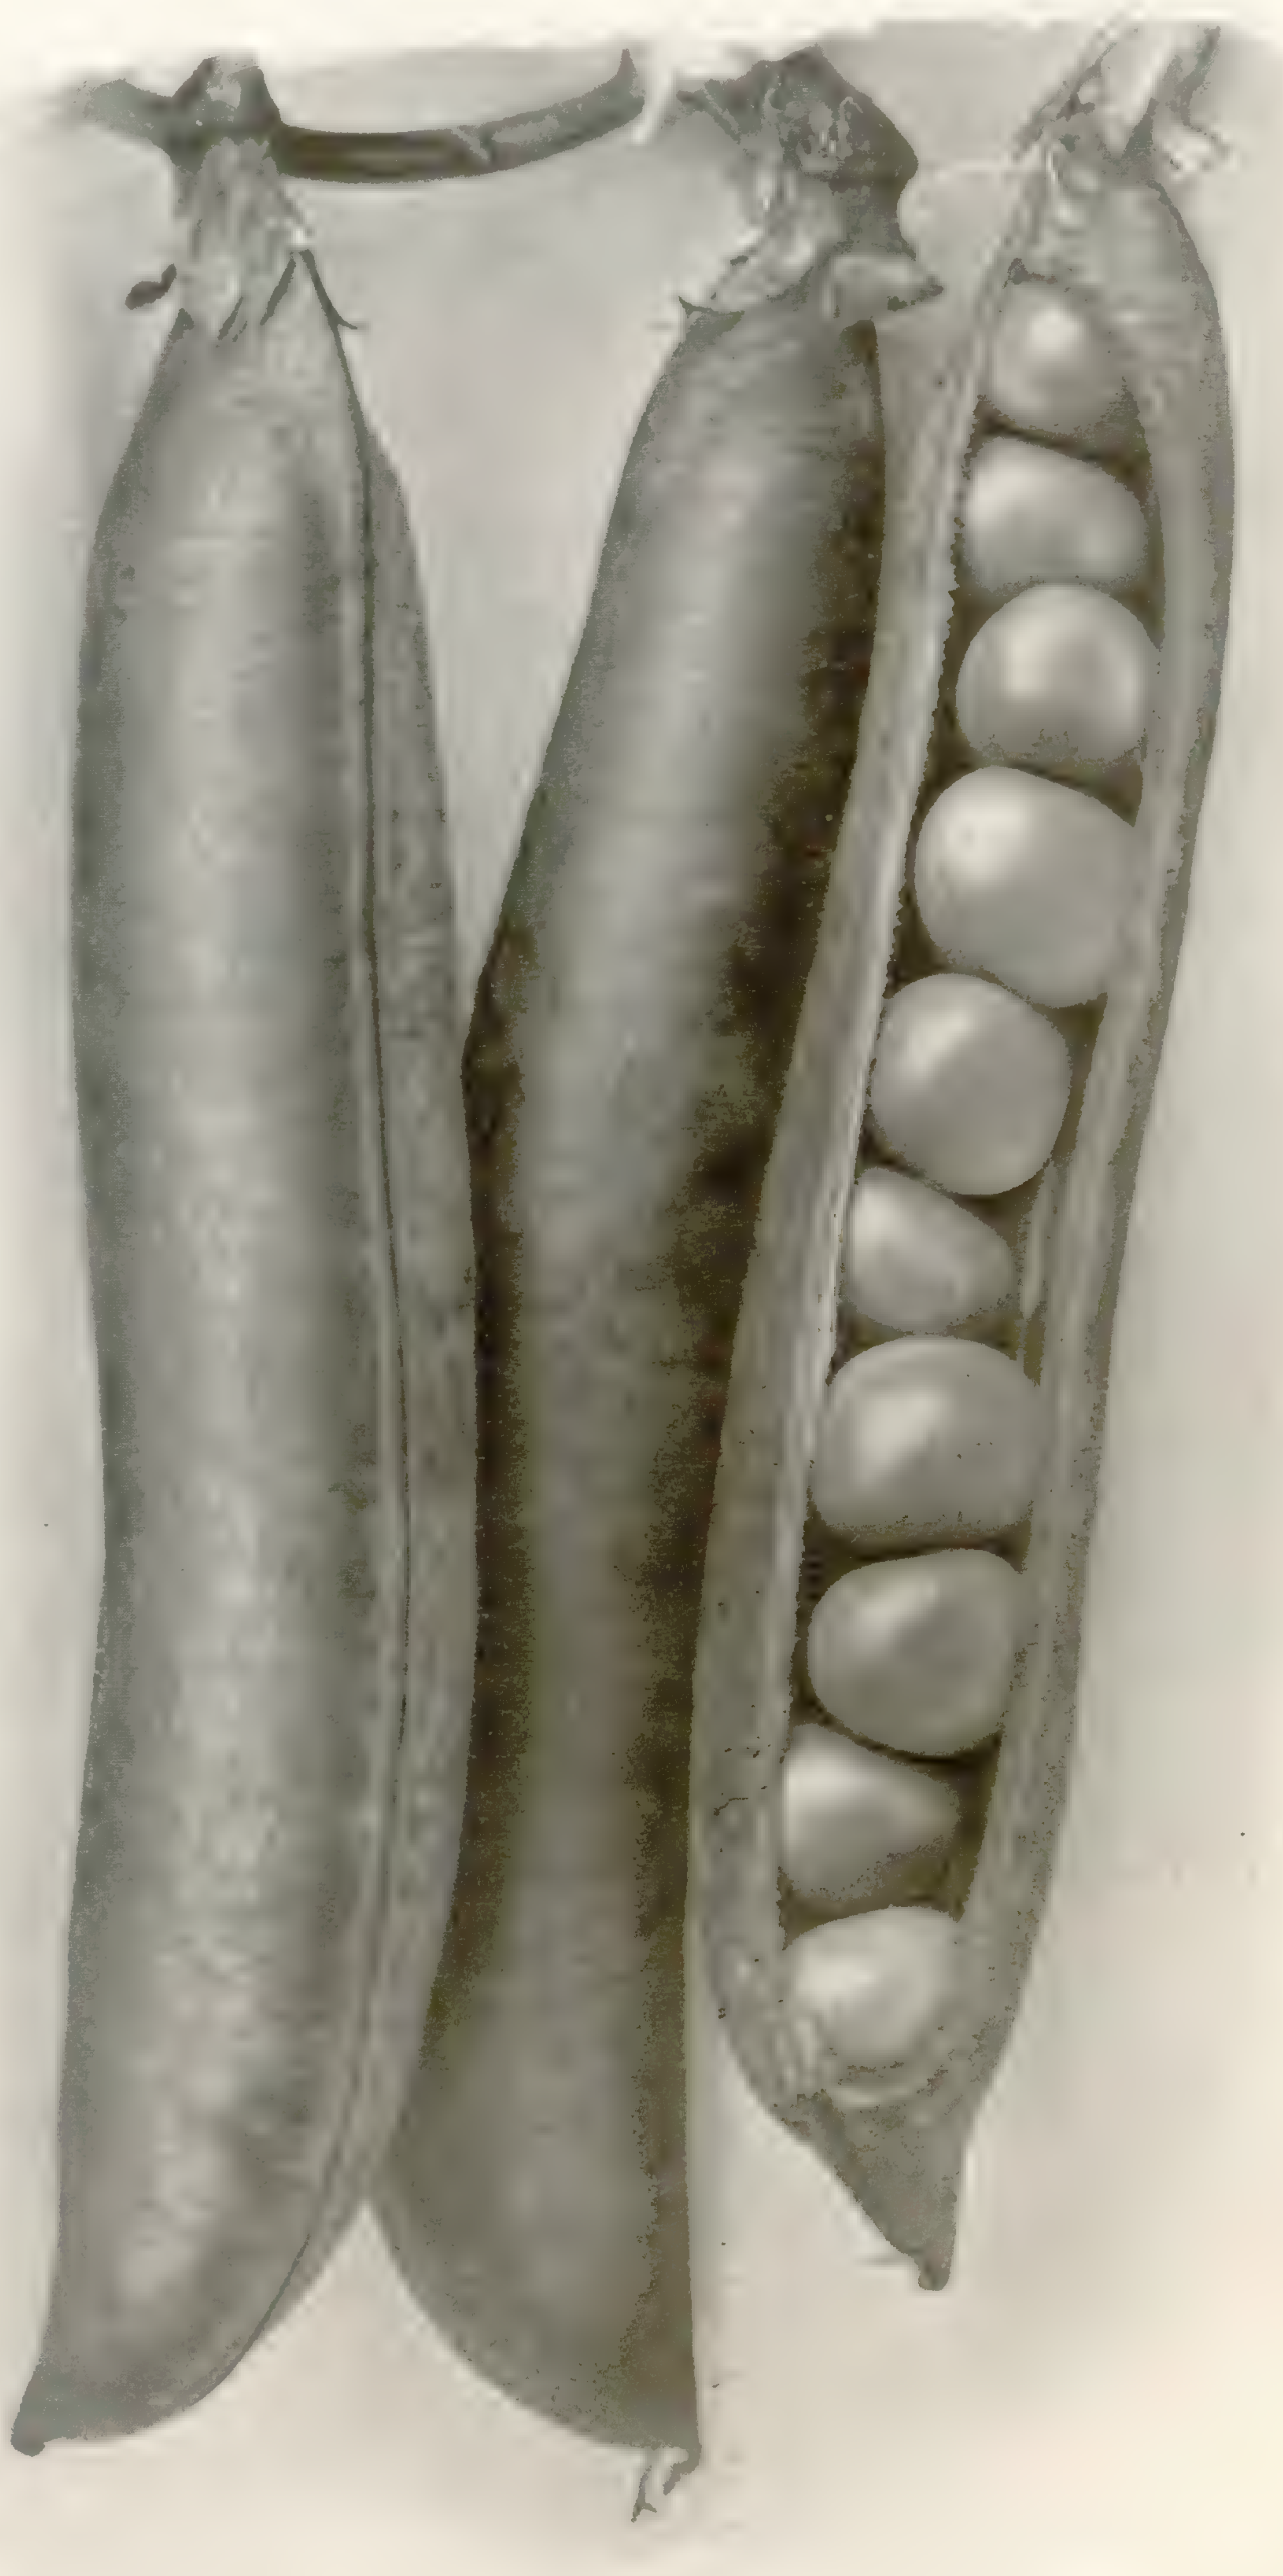
Freesia Chapmani.—This is an exceedingly pretty hybrid freesia, and one that would doubtless be more grown, but for the fact that the bulbs are comparatively expensive. It is the result of a cross between the rich golden-yellow Freesia aurea, whose blossoms are scentless, or nearly so, and the well known F. refracta alba. The flowers of Freesia Chapmani are of a beautiful golden-yellow colour, with a deep bright orange blotch.—W. T.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

MEXICAN LÆLIAS.—The different species and natural hybrids belonging to this winter-flowering section of popular orchids will now be passing out of flower, and will enter upon their prolonged season of rest. Lælia anceps, in its varied and attractive forms, are perhaps the most useful of the whole of this section in gardens where there is a demand for cut flowers in December and early in the new year. The graceful spikes are most serviceable for all cut flower purposes, and if the plants have been standing in a cool dry atmosphere a few days before the flowers are cut, it considerably increases their durability. These, and even the more rare of the white varieties, are now procurable for a modest outlay, and should certainly have the attention of gardeners and amateurs in districts where there is a clear atmosphere. Like many other of our winter-flowering orchids, they are particularly susceptible to the effects of fogs, and should not be grown in unfavourable situations, as there is nothing more distressing than to have the blooms destroyed after all the trouble that has been bestowed on the plants,



NEW PEA LORD LEICESTER.
(Messrs. Harrison and Sons, Leicester.)

and just as they are about to expand and display their charms.

CULTURE.—With these, as well as in the culture of most orchids, methods of treatment will differ, and as one method may be considered equal to another, when the particular situation and circumstances are considered, the cultivator who has succeeded should not be in a hurry to act on the advice of others, as it might lead to less favourable results. Sunless seasons are always more or less unfavourable to the flowering of Mexican lælias, and because a season like the present has not produced the results of previous years, it is not desirable to advise any important departure from the methods generally found successful.

RESTING.—It matters little as to whether the plants are repotted immediately after they have flowered, or whether this be delayed until the plants commence to grow later in the season. The most important item in the successful growing and flowering of L. anceps depends on the proper ripening of the pseudo-bulbs, and this largely depends on the treatment the plants receive during the dormant or resting season, i.e., between the times the flowers are removed from the plants and the commencement of new growth in the early summer. The plants should be placed in a cool, dry atmosphere, with the temperature about 53 to 55 degrees at night, and exposed to all the available light; they require but little root moisture now; only sufficient is necessary to keep the pseudo-bulbs and leaves plump, and damping the house about once a day will be found almost sufficient to secure this desirable condition for the next few weeks. If the plants are to be potted at once a compost such as that previously recommended for cattleyas will be found suitable. Provide ample drainage, as the plants require an abundance of water when in active growth.—H. J. **Chapman**, Oakwood Gardens

STOVE PLANTS.

EUCHARIS AMAZONICA. — Specimens that have been cultivated for winter bloom will by this date have completed their flowering season. If one is desirous of increasing the stock by the division of some of the largest specimens, extreme care must be exercised when carrying out this operation, and when the roots are in a healthy condition the bulbs should be parted so as to keep as much soil as possible about the roots. The pots used will vary according to the size and strength of the plants treated. The following compost will be found suitable: Strong fibrous loam, with the fine particles shaken out, a few lumpy pieces of peat, and a good addition of broken charcoal, Bedfordshire sand, and mortar rubble, so as to render the rooting medium as porous as possible. The pots used must be clean, dry, and thoroughly well drained with clean crocks. Both the compost and pots should be heated to the same temperature as that in which the eucharis are at present growing. Pot firmly, but carefully, avoiding injury to the tender roots. When circumstances permit the plants to be plunged over a moist bottom heat of 70 to 80 degrees, tan bark, or leaves will make a most suitable plunging material. After potting the plants may be watered sufficiently to settle the soil around the bulbs, but extreme care must at all times be exercised to guard against any excess of water; as a rule, a gentle dewing overhead with the syringe will suffice until the roots are thoroughly active again.

EUCHARIS MITE is a most destructive pest, and the cultivator must take every care to guard against an attack, or there will be disastrous results to the whole stock. During repotting the presence of the pest is easily noticed, and if it is present the bulbs and roots must be well cleansed with insecticide, and put into small pots. An occasional fumigation will have beneficial results, and the foliage and bulbs may be sponged at intervals during their growing season. Later in the spring, when the pots have become well filled with roots, an application alternately, of farmyard liquid and clear soot water will greatly improve the quality of the blooms, and impart a healthy green colour to the foliage.

COMPOST FOR POTTING STOVE PLANTS.—A good supply of best loam and peat is indispensable for stove plants. As a liberal supply of water is always required, on account of the high temperatures maintained throughout their growing season, it is essential that the roots at all times remain in a healthy condition, which cannot be maintained unless the rooting medium remains sweet.

WATERING.—Stove plants are at this season liable to injury through excessive applications of water while the roots are comparatively inactive. The soil may be allowed to become moderately dry, and afterwards given a thorough soaking: the water used must not be of lower temperature than the house in which the plants are growing.—**John Donoghue**, Bardon Hill Gardens, Leeds.

THE FLOWER GARDEN.

PROPAGATION of the various plants required for summer bedding must be commenced without delay. Iresine, coleus, alternanthera, lobelia, alyssum, verbenas, ageratum, fuchsias, Agathæa cœlestis, abutilons, and others required for this purpose should receive attention. Plenty of sand mixed with the soil is necessary for propagating purposes.

SUB-TROPICAL BEDS.—Seeds to sow now are those of ricinus, canna, Nicotiana Wigandioides, Datura suaveolens, Centaurea candidissima, Celosia plumosa, Eucalyptus globulus, Acacia lophantha, and A. dealbata. Also sow Begonia semperflorens, dahlias, pansies, pyrethrum, lobelia, Marguerite carnation, Lobelia cardinalis, Salvia Fireball, S. Pride of Zurich, and S. patens.

DAHLIAS.—The tubers which have been retained for providing cuttings may now be introduced into a little warmth, to induce growth. The roots should have all decaying parts cut away, and be placed in boxes deep enough to allow the roots to be covered with leaf-soil. Any labels that have become loose should be retied firmly on the stems.

FUCHSIAS.—Specimen plants which are grown for bedding, and have been given a rest, may now be pruned and started. A recently-closed fruit house is an excellent place for them, removing them to a more airy structure when growth has fairly started. Trained ivy-leaf geraniums should be cleaned, re-tied, and, if necessary, repotted. Should the latter operation not be required top-dressing will prove beneficial.

FLOWERING SHRUBS.—To obtain good results several kinds of flowering shrubs will require pruning at this season, amongst which are Spiræa callosa and varieties, S. Douglasi, S. salicifolia, and S. betulifolia. These flower best on the young wood, and should be cut back to within a few buds of the older growth. Buddleia variabilis, B. Lindleyana, B. Veitchi, and B. V. magnifica should also be hard pruned, and three or four buds will be found quite sufficient to leave on last season's growth. The same advice applies to Hydrangea paniculata, Ceanothus Gloire de Versailles, and C. Marie Simon.

PERGOLAS, PILLARS, AND ARCHES should be examined, and any decaying parts of the structures must be replaced with sound timber. All climbers requiring pruning should be attended to at once, and the growths tied in to give the whole a tidy appearance. The Jackmanni, lanuginosa, and viticella types of clematis may be pruned slightly, as they flower on the young wood. The Florida, montana, and patens sections, which flower on the old wood, should only have some of the weak growths removed. With regard to the rambler class of roses, all that is necessary now is to replace any ties that are broken, for the pruning of these roses should be done immediately the flowering season is past.

FLOWER BEDS remaining vacant throughout the winter should be dug, and the soil left in a rough condition until required for planting. When dressing the beds with manure it will be advisable to turn to the plan of the coming summer's bedding arrangement, or, probably, beds will be dressed which do not require it.—E. C. **Pooley**, Gnaton Gardens, Plymouth.

FRUITS UNDER GLASS.

EARLY VINERY.—Vines that are now ready for disbudding should be attended to as necessary. It is not wise to do all the work on one occasion; begin on the upper half of the rods first, as this will give a slight impetus to growth on the lower half. Do not tie down until the shoots have more substance. See that the borders are not dry near the hot-water pipes, and if symptoms of dryness appear give a good soaking with tepid water. If mealy bug is present it should be sought after very diligently on a sunny afternoon, as they then come out of their hiding places. Never take plants into a vinery that have had mealy bug on them. The temperature of the house should now be raised to 60 degrees by day and 55 degrees by night, allowing a rise to 70 or 75 degrees with sunshine, at the same time opening the top ventilators. Syringe twice daily, about 9 a.m. and 2 p.m., and damp down as often as is requisite.

CHERRY HOUSE. — Cherries cannot be hard forced, but by steady forcing can be had ripe by the middle or end of May. Where a cherry house is not available, these fruits do well in pots, bear very excellent crops, and can be grown in a mixed house; but when a house is devoted to them, the best fruits are taken from cordon trees trained to the roof, with pyramids along the centre, if room is available. Houses used for flowering chrysanthemums make ideal cool pot fruit houses. Special trees for forcing are prepared by fruit-growing nurserymen, and these can be plunged outside till required. Cherries are liable to severe attacks of black aphis, and, therefore, should be fumigated just before they come into bloom, and again directly after.

EARLY PEACH HOUSE.—When the trees are in flower the atmosphere may be kept a little drier, but do not increase the temperature at this stage. As the flowers become ready they should be pollinated to secure a good set. The flowers will not be ready for this operation till about the second day after opening: use a rabbit's or hare's tail fastened on the end of a stick to distribute the pollen. As soon as the flowers have set the fruit will swell rapidly, and young shoots or growths come away with increased rapidity; disbudding should, therefore, commence at the earliest possible moment. I like to do this work as soon as the shoots can be handled, but I do not advise stripping the tree all at once. It will be generally noticed that the tops of the trees require attention first. See that the borders are quite moist, and give a light fumigation at this stage, which will probably stay an attack of aphis. Sometimes ants are troublesome at the flowering stage, and destroy the crop by eating away the anthers: saucers of treacle and honey will entice them, and a grease band put round the tree stem will destroy a good many.

THE SECOND PEACH HOUSE should be closed, as the increasing sunshine will now be sufficient to start growth. Syringe the trees twice daily in fair weather. In later houses all tying and pruning should be brought to a finish as early as possible, and the walls should be limewashed (mixing in plenty of sulphur and petroleum); when this has been done leave the ventilators open day and night, and keep the house as cool as possible.

STRAWBERRIES. — More strawberries should be introduced into cool houses. The early batch now showing bloom should be assisted with weak liquid manure. Keep the soil healthy by regulating the water supply. Syringe both pots and foliage twice daily, excepting when in full bloom, though a gentle spray on a sunny day will not hurt the flowers, but assist pollination.—W. A. **Cook**, Leonardslee Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The meeting held at Westminster on Tuesday, January 31, was not a large one, nor was it of special interest; there was a fair display and a moderate attendance, but there was a feeling that exhibitors and visitors were reserving themselves for the show on the occasion of the annual meeting on February 14.

FLORAL COMMITTEE.

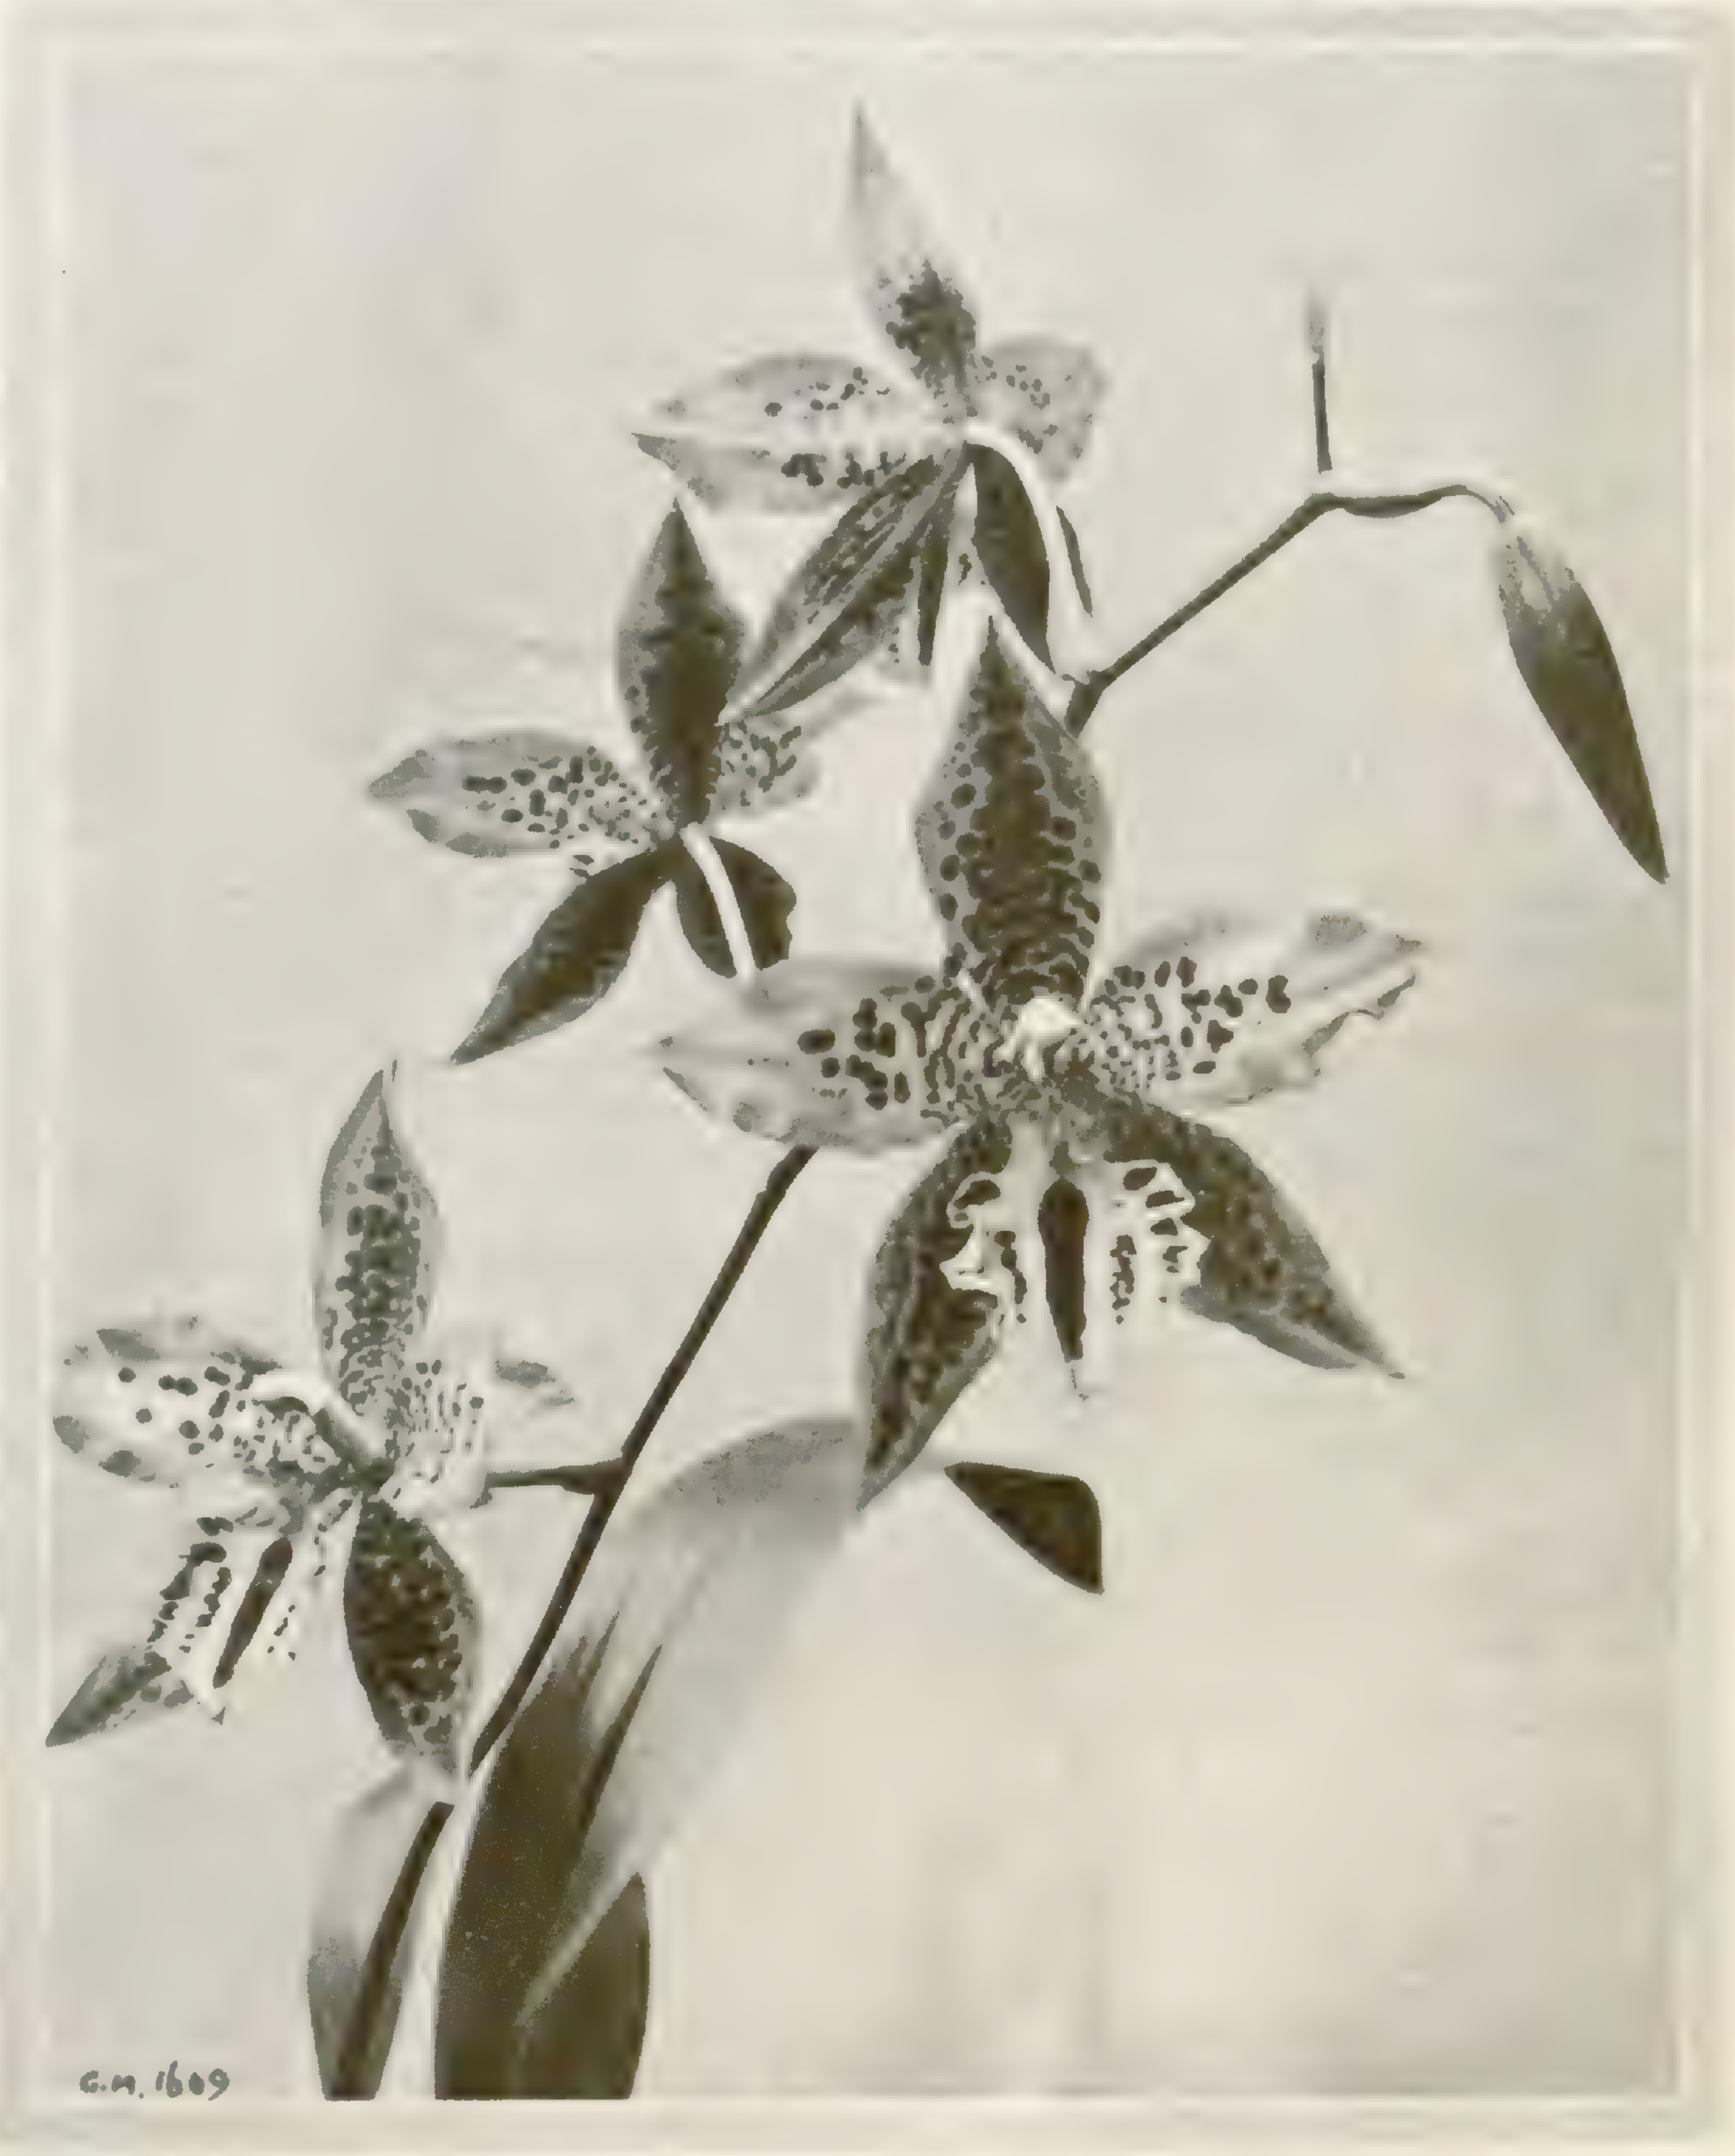
An attractive display made by Messrs. James Veitch and Sons, Chelsea, included a fine batch of Indian azaleas in variety, camellias, early rhododendrons, the new Erlangea tomentosa with bluish-lilac flowers, the fragrant Freesia refracta alba, the yellow greenhouse rhododendron named King Edward VII., and a splendid batch of Primula obconica that showed in their distinct colourings, finely formed and large flowers, the evidence of skilful selection and good culture—it represented a real grandiflora strain. Messrs. Bees, Ltd., Mill Street, Liverpool, exhibited about thirty plants of a pure white-flowered form of Primula malacoides, thus giving further evidence of the variation possible in this new Chinese species.

A very beautiful exhibit of forced flowering shrubs finely arranged by Messrs. R. and G. Cuthbert, Southgate, was the great feature of the meeting, and it once more ably demonstrated the value of so many of our hardy flowering shrubs for forcing and conservatory decoration. Cocos palms formed the background, and pterises the groundwork and margin of this big group. Azaleas of the mollis type gave the bold colouring, and they were finely flowered. In the centre were Magnolia conspicua, arranged with wistarias, and Pyrus malus atrosanguinea. Towards the back were tall standards of lilacs, wistarias, laburnum, Azalea mollis, and Staphylea colchica, and nearer the front were groups of Prunus triloba, staphyleas, and lilacs. The whole formed a brilliant and interesting contribution.

Such fragrant plants as Boronia megastigma, Daphne indica rubra, and varieties of Lilium speciosum were set up with spiræas and azaleas by Messrs. William Cutbush and Son, Highgate. Among early spring flowers this firm had Iris alata, I. sind-pers, I. Danfordi, the charming I. reticulata, I. Krelagei, and I. histrioides major, with blue primroses, Adonis amurensis, and Rhododendron præcox. Carnations formed another group from the Highgate firm, and here Marmion, Afterglow, Frank Galsworthy, Miss Winnie Pryor, Beacon, and the new Lady Elphinstone were well represented. Messrs. J. Cheal and Sons, Crawley, presented a little rock garden crowned with small pines, cupressus, hamamelis, heaths, spiræas, etc., and with saxifragas occupying the niches of the rocks. At the base were pretty groups of Iris reticulata, I. Danfordi, Primula denticulata, and P. d. alba, P. rosea, blue primroses, various tulips, and Iris alata.

Ferns were largely shown by Messrs. H. B. May and Sons, Edmonton, who had platyceriums, gymnogrammas in great variety, some adiantums, plumose nephrolepis, and davallias. Perpetual carnations were delightfully shown by Mr. H. Burnett, Guernsey, who brought over some beautifully bright flowers, and set up large vases of Enchantress, Marmion, White Perfection, Fortuna, Beacon, Rose Pink Enchantress, Mrs. H. Burnett, etc. Although not one of the largest, it was one of the best groups of carnations Mr. Burnett has staged. Mr. A. Fabius, Redlands Nursery, Emsworth, exhibited Adiantum farleyense Gloire Van Moordbrecht (A.M.), a remarkably distinct and handsome form.

In the rock garden display made by Messrs. T. S. Ware, Lim., Feltham, we noticed Helleborus guttatus, Primula cashmeriana alba, P. malacoides, Adonis amurensis, saxifragas, and the pretty little Morisia hypogæa. Messrs. Barr and Sons, Covent Garden, showed hardy heaths in flower, the graceful Garrya elliptica, and colonies of Iris reticulata histrioides, I. reticulata, Crocus balearica, Cyclamen coum, Galanthus Whittalli, and other lovely little early-flowering plants. Messrs. Stuart Low and Co.'s fine salmon-coloured cyclamen was well shown on this occasion by the Bush Hill Park firm; the Messrs. Low also once more set up a group of perpetual carnations, and displayed a considerable range of the popular varieties.



ODONTOGLOSSUM HARWOODI.
The flowers rich yellow freely marked with brown-chestnut. F.C.C., R.H.S., January 31. Messrs. Charlesworth and Co.

Zonal pelargoniums from Messrs. H. Cannell and Sons, Swanley, again proved the usefulness of these brilliant flowers for winter decorations where the skies are clear; the Swanley firm had also some good cinerarias, and some that showed considerable variation from the florists' type, and suggested new departures in the matter of form. Messrs. Phipps and Ireland, Barham, presented a small exhibit of alpines, and Messrs. W., Wells and Co., Merstham, showed their new White House carnation, and Edgar Forbes, a late rose-pink chrysanthemum. Mr. G. Reuthe, Keston, showed various interesting plants.

ORCHID COMMITTEE.

A striking and beautiful batch of Lælia anceps Sanderiana, with a score or more of spikes of lovely white flowers, formed the central feature of Messrs. Charlesworth and Co.'s group of orchids. On either side of these were such lovely things as Brasso-cattleya Queen Alexandra, Lælio-cattleya Bella alba, Cattleya Octave Doin, Odontioda Diana, O. Vuylstekiæ, O. Bradshawiæ, O. heatonense, Odontoglossum ardentissimum, O. Harwoodi (F.C.C.), a new yellow hybrid between O. Wiganianum and O. maculatum auriferum; O. Dora, O. Doris, and some good cypripediums. In Messrs. Armstrong and Brown's exhibit from Tunbridge Wells, the outstanding plant was Cypripedium Duke of Connaught (C. Beryl and C. nitens Ball's var.), which carried two very large bright green, purple-spotted flowers; C. Euryades New Hall Hey var., C. Œdippe, C. Venus Orchidhurst var., C. triumphans, C. Helen II. var. Fascinator, and Odontioda Vuylstekæ were other good things.

A group of cypripediums from Mr. W. Carr, gardener to E. Roberts, Esq., D.S.O., Park Lodge, Eltham, included C. villosum auriferum, C. Œdippe, C. Thompsonianum, C. St. Albans, C. Sir Redvers Buller, C. Miss May Roberts, C. Olivia, C. Victor Cavendish, and other good things. Mr. Hale, gardener to Samuel Larkin, Esq., The Ridgways, Haslemere, staged a small group of cypripediums, odontoglossums, and cattleyas, and Messrs. Heath and Son, Cheltenham, submitted a few cypripediums.

Messrs. Stuart Low and Co., Bush Hill Park, contributed, among other orchids, Cypripedium Sallieri aureum, C. Euryades, C. Victor, C. Œdippe, the pretty Platyclinis glumacea, Cattleya Percivaliana, Vanda Amesiana, Epidendrum Endresio-Wallisi, and the quaint, small, and beautiful Bulbophyllum lemniscatoides. The certificated variety of Cypripedium Beryl was well shown by Messrs. Hassall and Co., Southgate, the plant carrying three fine flowers; Sophro-cattleya Warnhamensis and Odontioda Cecilia were shown by Mr. R. G. Thwaites, Chessington, Streatham.

From the Westonbirt collection, Mr. H. Alexander, grower to Lieut.-Colonel Sir George Holford, brought up a magnificent plant of Lælia anceps Chamberlainianum, carrying twenty-one flowers (cultural commendation), a grand plant of Odontoglossum crispum Peacock (F.C.C.), Brasso-cattleya Euterpe (A.M.), Vanda Watsoni, and three lovely spikes of the rare and chaste Cœlogyne Mooreana. Major Rogerson, Heatherdale, Harpenden, submitted a small group of well-grown cypripediums, and Mr. J. S. Moss, Winter Hill Hall, Bishops Waltham, showed a plant of Odontoglossum nevadense with five spikes. A very fine group of cypripediums from Messrs. J. Cypher and Sons, Cheltenham, contained good specimens of C. Beekmani, C. Euryades, C. aureum Virginale, C. Mrs. Mostyn, C. Van Dyke, and C. Leeanum Clinkaberryanum.

Mr. Day, gardener to H. S. Goodson, Esq., Putney, put up some very handsome orchids that included the beautiful Odontioda Cooksoniæ Royal Scarlet, Odontioda Lutetia, Cymbidium Lowianum grandiflorum, Odontoglossum ardentissimum Herbert Goodson, O. Rolfeæ, Brasso-cattleya Warneri-Digbyana, Sophro-cattleya Psyche, and numerous cypripediums. Messrs. Sander and Sons, St. Albans, had many interesting plants in their group of orchids. Cypripedium Leeanum Thunderer was the most prominent subject, but the new yellow Coryanthes Balfouriana, Cypripedium Maudiæ splendens, the miniature Lælia Lundi, Houlletia Sanderæ, Vanda Watsoni, and Masdevallia polysticta were also notable.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Sutton and Sons, Reading, exhibited fine samples of their Long Keeping, Ailsa Craig, Improved Reading, and other excellent onions, all large clean bulbs.

A beautiful lot of apples from Messrs. J. Cheal and Sons, Crawley, attracted a great deal of attention, as the fruits were of excellent size, brilliant colour, and well preserved, Newton Wonder, Lord Derby, Bramley's Seedling, Alfriston, Sandringham, Schoolmaster, Atalanta, Barchard's Seedling, Bess Pool, Lane's Prince Albert, Chelmsford Wonder, and King Edward were all remarkably well represented.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Odontoglossum crispum Peacock, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury; and to Odontoglossum Harwoodi, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Brasso-cattleya Euterpe, from Lieut.-Colonel Sir G. Holford; to Cypripedium Duke of Connaught, from Messrs. Armstrong and Brown, Tunbridge Wells; to Odontoglossum Mariæ, from Messrs. Charlesworth and Co., Haywards Heath; to Odontoglossum Warscewiczi var Picta, from Messrs. Charlesworth and Co.; and to Adiantum farleyense Gloire Van Moordbrecht, from Mr. A. Fabius, Redlands Nursery, Emsworth.

MEDALS.

Gold.—To Messrs. R. and G. Cuthbert, Southgate, for forced flowering shrubs.

Silver-gilt Banksian.—To Messrs. James Veitch and Sons, Chelsea, for flowering plants; to Messrs. William Cutbush and Son, Highgate, for carnations and hardy flowers.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. Stuart Low and Co., Enfield, for carnations and cyclamen; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to H. S. Goodson, Esq. (gardener, Mr. Day), Putney, for orchids.

Silver Banksian. — To Messrs. Barr and Sons, for hardy plants; to Messrs. Joseph Cheal and Sons, for rock garden; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Messrs. H. Cannell and Sons, Swanley, for pelargoniums and cinerarias; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; and to Messrs. James Cypher and Sons, Cheltenham, for orchids.

Silver-gilt Knightian.—To Messrs. James Cheal and Sons, Crawley, for apples.

SCIENTIFIC COMMITTEE, January 17.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Dr. J. A. Voelcker, Messrs. J. T. Bennett-Pöe, A. D. Michael, C. E. Shea, A. Worsley, W. Hales, H. J. Elwes, J. Fraser, W. C. Worsdell, R. A. Rolfe, and F. J. Chittenden (hon. secretary).

SAP EXUDATION IN ELM TREES.—Mr. J. Fraser, F.L.S., showed a piece of the bark of an elm tree perfectly white, part of a strip extending down the trunk of a tree from a small wound some distance up. He remarked that wounds in elms may bleed for several years, as they often take many years to heal. The white appearance of the strip was due to the death of the green alga which covered the trunk elsewhere, but which, where the sap flowed, had been destroyed. Mr. Fraser thought that possibly the sap of the tree itself had had an injurious effect upon the alga. The death of grass and other plants beneath trees was alluded to by various members of the committee, and it was thought it could not be entirely accounted for by the shade cast by the tree, or by the honeydew which falls from such trees as limes and others in most seasons.

AZALEA GALL.—A galled growth from Azalea indica came from Cheltenham. The whole of the leaves at the tip of a shoot had become greatly and uniformly thickened, and were covered with a whitish "bloom." These galls, which have comparatively recently made their appearance in England, are due to the attack of the fungus Exobasidium japonicum. The only remedy is to pick the galled growths off and burn them.

COLORATION OF BEAN SEEDS.—Mr. Chittenden showed a series of seeds of French bean grown at Wisley in the past summer from seed shown before the Committee last January, when its history was given. The parent seed was the result of an accidental cross in 1907, and the progeny had segregated in 1909. The seeds sown and the seeds produced in 1910 were as follows:—

(a) Parent seeds black: Plant 1 produced 28 black seeds, 25 partly chocolate, partly black, 35 brownish black. Plant 2 produced 52 seeds like parent. Plant 3 produced 285 seeds like parent. Plant 4 produced 46 seeds brownish black.

(b) Parent seeds creamy white: Plant 1 produced 170 seeds purplish, tinted white, with mottling and spots and streaks of black, 55 black or reddish black with small spots of purplish white. Plant 2 produced 100 seeds fleshy white. Plant 3 produced 90 seeds creamy white, 5 flesh white.

(c) Parent seeds tan: Plant 1 produced 25 seeds chamois. Plant 2 produced 22 seeds dead-leaf brown with tiny spots fleshy white; 32 little lighter than foregoing with large number of spots and blotches of fleshy white, the blotches speckled with ground colour; 7 brownish terra cotta with tiny spots of fleshy white; 35 terra cotta with spots and blotches of fleshy white speckled with terra cotta. Plant 3 produced 72 seeds chamois to dark hazel. Plant 4 produced 115 seeds chamois, more or less mottled with black.

(d) Parent seeds maroon: Plant 1 produced 135 seeds bistu to dark tan. Plant 2 produced 25 seeds purple-black to buff. Plant 3 produced 33 seeds dark steel-blue to lighter purplish-blue. Plant 4 produced 195 seeds purple-black to snuff colour. Plant 5 produced 135 seeds like plant 2.

(e) Parent seeds reddish-salmon with streaks of burnt umber. Plant 1 produced 173 seeds yellowish-salmon with many streaks of fawn (like parent); 18 seeds fawn, except for few small spots of pale yellowish-salmon. Plant 2 produced 1[illegible]6 seeds like striped ones of plant 1. Plant 3 produced 170 seeds pale yellowish-salmon with faint grey mottling, striped with burnt umber; 6 wholly burnt umber, except for few small spots of pale yellowish-salmon.

(f) Parent seed pale flesh with streaks of dark neutral tint: Plant 1 produced 85 seeds pale putty to cinnamon. Plant 2 produced 230 seeds pale flesh mottled and more or less streaked with neutral tint (like parent).

(g) Parent seed chocolate: Plant 1 produced 55 seeds Naples yellow more or less mottled with neutral tint. Plant 2 produced 22 milk-white seeds.

(h) Parent seed violet-black with streaks and spots of rosy-white: Plant 1 produced 100 seeds milk-white to creamy-white. Plant 2 produced 9 seeds milk-white; 81 greenish-white. Plant 3 produced 128 seeds with rosy-white ground mottled and streaked with violet-black so that seed appeared purple. Plant 4 produced 195 seeds similar to plant 3, but less mottled

(i) Parent seed rosy-white with more or less ivory-black: Plant 1 produced 45 seeds of rosy-white faintly mottled with dilute black and blotched and streaked with violet-black. Plant 2 produced 11 seeds fleshy-white. Plant 3 produced 175 seeds with rosy-white ground, some half, some almost entirely covered with greenish-black. Plant 4 produced 75 seeds similar to those from plant 2, but faintly mottled with grey. Plant 5 produced 90 seeds with very pale rosy-white ground mottled with much diluted violet-black and with streaks of violet-black. Plant 6 produced 41 seeds violet-black speckled with rosy-white; 48 violet-black more spotted with rosy-white; 20 seeds neutral tint with small spots of rosy-white; 52 neutral tint with large spots of rosy-white; these differences were not clearly marked, however.

(j) Parent seed burnt umber: Plant 1 produced 370 seeds maroon. Plant 2 produced 90 seeds milk white faintly mottled. Plant 3 produced 290 seeds fawn. Plant 4 produced 398 seeds maroon.

(k) Parent seed pale flesh with large spots, streaks and specks of burnt umber: Plant 1 produced 42 seeds pale flesh with streaks of lilac-rose. Plant 2 produced 98 seeds pale flesh, some almost wholly, others half covered with tan. Plant 3 produced 48 seeds milk-white; 90 sulphur-white. Plant 4 produced 225 seeds with pale flesh spotted with diluted umber and more or less covered with burnt umber, as in plant 2.

(l) Parent seed chamois faintly mottled: Plant 1 produced 93 seeds cream-yellow to chamois, more or less mottled with olive-brown. Plant 2 produced 74 similarly-coloured seeds.

(m) Parent seed pale blush with parts reddish-black: Plant 1 produced 195 seeds purplish tinted white, much or only half-covered with darker spots and blotches. Plant 2 produced 200 seeds milk-white to yellowish-white.

(n) Parent seed dark chocolate-brown with patches of dark fawn: Plant 1 produced 305 seeds fleshy-white with more or less chocolate-brown.

(o) parent seed chocolate with small spots of rosy-white: Plant 1 produced 36 seeds chocolate. Plant 2 produced 50 seeds chocolate.

Birmingham Gardeners' Association.

The inaugural meeting of the spring session was held at the Athletic Institute, when the vice-chairman, Mr. C. H. Herbert, presided over a good attendance, including professional lady gardeners, to hear the president, Professor G. S. West, M.A., D.Sc., of the University, Birmingham, lecture on "Peach Leaf-Curl, or Blister, as an Example of How a Plant Disease may be Successfully Treated." Excellent lantern slides were shown, illustrating the affected foliage, and "doctored" peach trees in California, Australia, and other countries. In some introductory remarks, the Professor commented upon the erroneous ideas concerning this disease, which have such a widespread belief among gardeners, pointing out that such ideas were the result of ignorance of the nature of the disease, and of the certain means of prevention. The Professor also said that in some cases it appeared to be wilful ignorance, the English gardener clinging with great persistency to ancient beliefs, and flatly refusing to accept scientific facts based upon experiment. A short account was given of the geographical distribution of the disease, New Zealand being mentioned as the country which has, perhaps, suffered more than any other from peach leaf curl. Special reference was made to the exhaustive investigation of this disease carried out in the United States from 1891 to 1900, largely by the U.S. Department of Agriculture. For some years previous to 1891 the loss to peach-growers from leaf-curl alone was estimated at more than 3,000,000 dollars, and the resulting investigation of the disease shows clearly and conclusively the enormous benefits which can accrue from the proper scientific treatment of a plant disease. The lecturer discussed in detail the nature of peach leaf-curl, pointing out how the development of the parasite which caused it was intimately linked with special physiological phenomena of the peach tree, these in turn being dependent upon such external influences as temperature, moisture, etc.

The direct cause of the disease is a parasite fungus (Exoascus deformans), and too much emphasis cannot be placed upon the fact that the fungus alone is responsible for the injury to the tree; without the parasite not a leaf would curl, nor a peach fall. The life history of the parasite was fully described, and the results of large numbers of experimental investigations were given. The paramount fact, discovered independently in the United States, and in Australia, is that winter treatment of the trees, by the application of copper solution sprays, will effectually control the disease. This is due in a great measure to the fact that most of the spring infections of the peach occur from spores of the fungus, which have wintered on the tree and about the newly-formed buds.

The lecturer gave a history of the treatment of peach-leaf curl, showing how the disease was prevented in many of the United States orchards ten years before its successful treatment in Europe. The different kinds of sprays were dealt with, and also the way in which they were applied, both in small and large orchards. A full account was also given of the beneficial results of winter spraying. In many cases there is enormous gain in the foliage and in the fruit set, the whole realising a net gain of £98 per acre. Where trees are planted 25ft. apart experimental evidence proves clearly that peach-leaf curl may be cheaply and easily prevented.

The lecture was illustrated by numerous slides of the parasite, the diseased parts of the trees, and the methods of spraying in large orchards.

After an interesting discussion, in which Messrs. A. D. Christee, Wm. Gardiner, Wm. Spinks, and Alfred Cryer chiefly took part, the meeting closed with a hearty vote of thanks to Professor West for his instructive address.

Beckenham Horticultural Society.

On Friday, the 20th ult., Mr. H. J. Dudney, of The Nurseries, Erith, lectured to the above society on "Floral Decorations," Mr. W. A. Murrells, in the chair. Owing to counter-attractions the attendance was small, but the enthusiasm of those present somewhat compensated for the lack of numbers. The lecturer began by stating that the subject was a difficult one to teach, and that decorators were born, and not made. He contrasted the present high pitch attained in decorations with the styles in vogue two or three decades past, when short-stemmed flowers were in common use. By the aid of a supply of carnations of differing shades and colours the lecturer was able, by ringing the changes, to clearly demonstrate how to arrange them to produce the greatest possible floral effect. All flowers, he urged, should, as far as possible, be arranged with their own foliage.

The lecturer pointed out that the tone of rooms to be decorated, and the colour of the hostess' gown had to be considered to ensure a satisfactory blend of colour. Lists of carnations, roses, and chrysanthemums were given as suitable to grow.

A hearty vote of thanks was accorded Mr. Dudney for his excellent discourse, and for the ready way the questions put to him during the same were answered.

Bournemouth Horticultural Society.

The annual general meeting of the subscribers to the above society was held on Thursday, January 26. Mr. G. H. Rolls, J.P., chairman of the committee presided. The annual report was read; it referred to both shows held during 1910, namely, the third exhibition of spring flowers, and the twenty-fourth exhibition of chrysanthemums, fruit, vegetables, etc. The exhibitions were of a high order of merit, and attracted a vast attendance, the weather being very favourable. The report and statement of accounts for the year 1910 were adopted.

The committee are always ready to add new and interesting features, so as to have the society quite up to date, and several innovations were suggested which will receive very careful consideration.

Alderman Beale was re-elected president, and nearly all the vice-presidents were re-elected. Sir Daniel Morris, who is well known in the horticultural world, was elected chairman of the committee; Mr. Rolls, who has acted as chairman in that

Eckford's
Giant SWEET PEAS

SWEET PEA PERFECTION.

A flower garden without Eckford's Sweet Peas can only be compared to a house without furniture.

Sweet Peas are requisite to the small, medium, or large garden, and if you wish to have colour, effect, prize specimens, and tall plants, then send to Eckford's for your seeds.

The time to buy is NOW. The firm to buy from is Eckford's. No other seed specialist in the world can rival Eckford's for Sweet Peas.

Larger flowers, longer stems, brighter colours, and a profusion of bloom is the result of growing Eckford's seeds.

Remember, Genuine Eckford's Seeds can only be obtained direct from Wem. No Agents are employed.

SPECIAL NOVELTY OFFER FOR 1911.

A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction.

LUMINOSA.—This variety will be appreciated for its deep coral colour, which for decoration is unexcelled, having the quality of giving off greater brilliance in artificial light than any other variety. Very scarce. In sealed packets, 7 seeds, **6d.**; 15, **1s.**

VICOMTE DE JANZE.—A fine bold flower of exquisite shape, the standard being splendidly erect; in colour it is deep bright rose, perfectly distinct; a charming flower. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

DODWELL F. BROWNE (WAVED).—This is a [illegible] intense bright crimson, three and four [illegible], almost a self; a true Giant Waved variety of intense King Edward VII. colour. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SAINT GEORGE.—Light orange pink standard with slightly lighter wings; almost a self; good sizes; slightly waved. In sealed packets, 20 seeds, **3d.**; 40, **6d.**; 80, **1s.**

ASTA OHN (WAVED).—A pretty waved lavender overlaid with rose; a very charming flower of good size and substance. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MAGGIE GERRING.—This is a decided acquisition with a bold standard of perfect shape, and beautifully balanced wings. In colour it is a soft cream overlaid with a delightful shade of pink which rather deepens towards the edges. It is exquisitely rich in tone when bunched. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

APPLE BLOSSOM (WAVED).—This, as its name implies, is a beautiful flower of apple blossom colour, of giant size, and, like most of the waved varieties, is a very strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. E. GILMAN.—A fine bold flower, with expanded standard. It has a creamy ground suffused with bright rose, and almost pure cream wings. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

PICOTEE (WAVED).—This is one of the very finest introductions, being a giant waved flower, pure white, with a beautiful picotee edge of carmine; in most cases the flowers are borne in fours on a long, strong stem. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

EVELYN HEMUS (WAVED).—A warm cream shading to yellow, with a picotee edge of terra-cotta pink; of great size and refinement; standard and wings beautifully waved, and nearly always four flowered. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. HENRY BELL (WAVED).—A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s**

MID BLUE.—A medium sized erect flower of deep sky blue. It is a strong grower, very free, and frequently four flowered; quite distinct. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

OTHELLO (WAVED).—A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s**

CERISE (WAVED).—A fine, bold, beautifully waved, true cerise; a very strong grower, giving generally four flowers on long, strong stems. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SPECIAL OFFER.
One full-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **12/6** post free for cash with order.
One half-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **6/6** post free for cash with order.

SPECIAL COLLECTIONS FOR 1911.

Villa (A) Collection. 24 very choice varieties, suitable for villa garden, excellent giant flowered sorts, most suitable for cutting and exhibition, 25 seeds of each, **10s.**

Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s. 6d.**

Half-Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 25 seeds of each, **3s.**, post free for cash.

FREE. Send a postcard to-day for large illustrated and coloured catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

HENRY ECKFORD, F.R.H.S (Dept. 221), WEM, SHROPSHIRE.

able way which has commended itself so much to members in the past, was elected vice-chairman, and he himself proposed Sir Daniel Morris as the chairman. Mr. Robert Chamberlain was re-elected treasurer, and Mr. C. W. Barrett, secretary.

The retiring members of the committee were re-elected, on the motion of Major Mannsell, J.P., and Dr. Hamilton and Mr. Rayner were added to the committee.

Immediately after the close of the general meeting the committee arranged several matters of urgent importance connected with the shows for the current year. The dates on which the spring show is to be held, namely, April 4 and 5, were fixed in due course last year. The autumn show for 1911 is now fixed to be held on October 31 and November 1. A sub-committee was appointed to deal with the schedule of prizes and make suggestions for improvement.

Reading Gardeners' Association.

The first fortnightly meeting of the Spring Session was held in the Abbey Hall, by kind permission of Messrs. Sutton and Sons, on Monday, January 23. The president, Mr. Alderman Parfitt, occupied the chair, and there was an excellent attendance.

Several new members having been elected and other business settled by the meeting, the President called on Mr. Exler, The Gardens, Bozedown, Whitchurch, to deliver his lecture on "Cyclamen." In a brief but very lucid paper Mr. Exler gave excellent advice as to the treatment of this lovely winter-flowering subject, which just now is to be seen in the conservatory and greenhouse in all its beauty.

Preparing a proper compost, sowing the seed, pricking off the seedlings (a most delicate operation), potting and repotting, were all dealt with in turn. The storing and treatment of old corms was also referred to, but the lecturer expressed himself as being strongly in favour of rearing a new batch of seedlings each year, rather than relying on old plants.

At the conclusion of Mr Exler's remarks an excellent discussion was maintained by the many cyclamen lovers among the members. A vote of thanks to the lecturer and president concluded the meeting.

AN AMATEUR'S ORCHID.

Although I have only been a subscriber to the GARDENERS' MAGAZINE during the last nine months, I have gleaned much useful information from it, especially from the notes in regard to orchids. I was surprised, however, to see the remarks on Dendrobium nobile which recently appeared, to the effect that good flowers could not be obtained during January and February.

I grow about a hundred different kinds of orchids, as an amateur, in one house only, with an average minimum temperature of 50 deg. Fahr., with fair success. Of course, I shift the plants to the position (cool or warm) most suitable to them, and although this particular orchid is grown fairly cool during the winter, flower buds invariably show by Christmas time, and there is plenty of bloom from the middle or end of January onwards. I enclose photograph of a spray of bloom [not suitable for reproduction.—ED., G.M.], taken at the end of January, which will give an idea of its flowers. You will notice the three blooms from one node. It is very rarely I get less than three, whereas plants I have seen blooming in Kew only give one. Is this a particular variety of nobile, or is it on account of vigour?

I grow more dendrobe species than other kinds, but it is puzzling to know their correct season of growth, winter temperature, etc. Would it be troubling Mr. Chapman, or other of your orchid specialists, too much to let me know the code of treatment for the following:—D. thyrsiflorum, flower buds visible, and leaves gradually withering and falling; D. crepidatum, just completing growth; D. primulinum, all leaves off and flower buds visible; D. aureum, ripening nearly completed and nodes swelling for flower; D. formosum giganteum (imported plants bought last spring), growths moved very slowly, and quite decayed last month. Fresh growth eyes visible; D. Jamesianum, leaves turning yellow, flower buds swelling at apices of bulbs.

D. formosum giganteum seems to require a higher temperature than I have available, as the growths made last season moved very slowly and ultimately collapsed. Trusting I am not trespassing too much on your space and kindness, and tendering thanks in anticipation.

HENRY R. STERRETT.

Cestrums.—These, which are better known in gardens as habrothamnuses, are of great service in large greenhouses, where a considerable space of wall, roof, or lofty pillars has to be furnished. In this way they are very rarely without their bright-coloured blossoms. Perhaps the best-known is C. elegans, with purplish-red blossoms, those of C. Newelli being more of a clear deep red. Cestrum aurantiacum is scarcely as continuous flowering as the preceding, for as a rule it commences to bloom early in autumn and continues till mid-winter or later. This has orange-coloured flowers. In C. Smithi, which is less vigorous than the others, the blossoms are pink.—W. T.

Muscat Grapes.—These require a long season of growth in order to finish their fruit satisfactorily. Therefore, the house should be made ready immediately, and at once closed, but no heat applied. If there is an outside border, cover it with dry bracken or similar material. In the case of unfinished inside borders, if it is necessary to enlarge them (i.e., if the roots are coming through), prepare some soil, and keep it in the dry till the vines are well started. It will be found good practise to do this work just before the vines come into flower, when the roots are active, as they immediately catch hold of the soil, and improve in strength. A good mixture will be three parts fibrous loam, not too heavy in texture, and the remaining part made up of bone-meal, lime rubble, and some approved fertiliser. This should be turned over several times, so that the ingredients are thoroughly mixed. The drainage in all cases should be made perfect.—W. A. COOK.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Elesleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

CYMBIDIUM.—G. G., Aberystwyth: You cannot do better than keep the plants in a comfortable intermediate temperature. If the old material is in good condition, and the drainage correct, do not disturb the plants.

BEGONIA GLOIRE DE LORRAINE UNDER COOL TREATMENT.—"H. K.," Edinburgh, writes: With reference to the note under Answers to Correspondents in the issue for January 14, concerning Begonia Gloire de Lorraine under cool treatment, I will state my experience very briefly here, as I propose at a later date to send a full account of this popular begonia, from propagation to the flowering period. I think your correspondent may rest quite assured that to root and to grow this plant in its young stages well (which is the forerunner of perfection later on) is practically impossible with a minimum temperature of less than 65 deg. at night, as with a lower temperature the rooting process is so slow as to cause the cuttings to become hard and thin, after which, the plants never grow away freely. When growing freely in 5in. pots a little less heat from thence onward, with a minimum night temperature of 60 deg., will encourage stouter growth and darker foliage. When flowering commences a temperature of 55 deg. will be ample, and will also put better colour into the blooms, at the same time hardening the plants to some extent for house decoration, and for passing through the winter months better.

JANUARY CHRYSANTHEMUMS.—A.M., Macclesfield: Amateurs will find some difficulty in cultivating January-flowering chrysanthemums successfully because of the tendency on the part of many late varieties to produce blind or flowerless growths. In making a selection, however, this point has been considered, and the varieties mentioned are the best. The finest white is Winter Queen, but it should be disbudded freely during November, and later, retaining but one bud to each shoot; unfortunately it is a tall variety, growing from 6ft. to 8ft. high, but it produces fine flowers well on into February. Madame T. Panckouke is a good, useful white to precede the above. Many growers do well with Heston White: it must be kept in a light, airy house, and three plants grown in 9in. or 10in. pots. It is best undisbudded for the latest blooms. Mrs. Joseph Thompson is a white much grown for market, but it is earlier than the other three, though a good cut may be had up to the middle of January. This last-named variety has produced several sports, among them being two shades of yellow, and both are equally good for late blooming. The old variety, W. H. Lincoln, is successfully flowered by some growers throughout the month. It requires to be stopped in late July. Ophir, a rich golden-yellow sport from Princess Victoria, is very useful: its blooms are fuller than those of the parent. Allman's Yellow is liked by some, and it is very late if stopped during July. For a late crimson chrysanthemum nothing equals W. J. Crossley, and the most popular pink is Winter Cheer. Madame L. Charvet is a good pink for Christmas and New Year: it is in the stem longer than the preceding, but the colour is less bright. It must be remembered that all pink coloured varieties, especially if bloomed late and kept in a close or warm house, will lose very largely in colour; in fact this latter variety is with many growers a dirty white rather than pink. Christmas Rose, which is somewhat

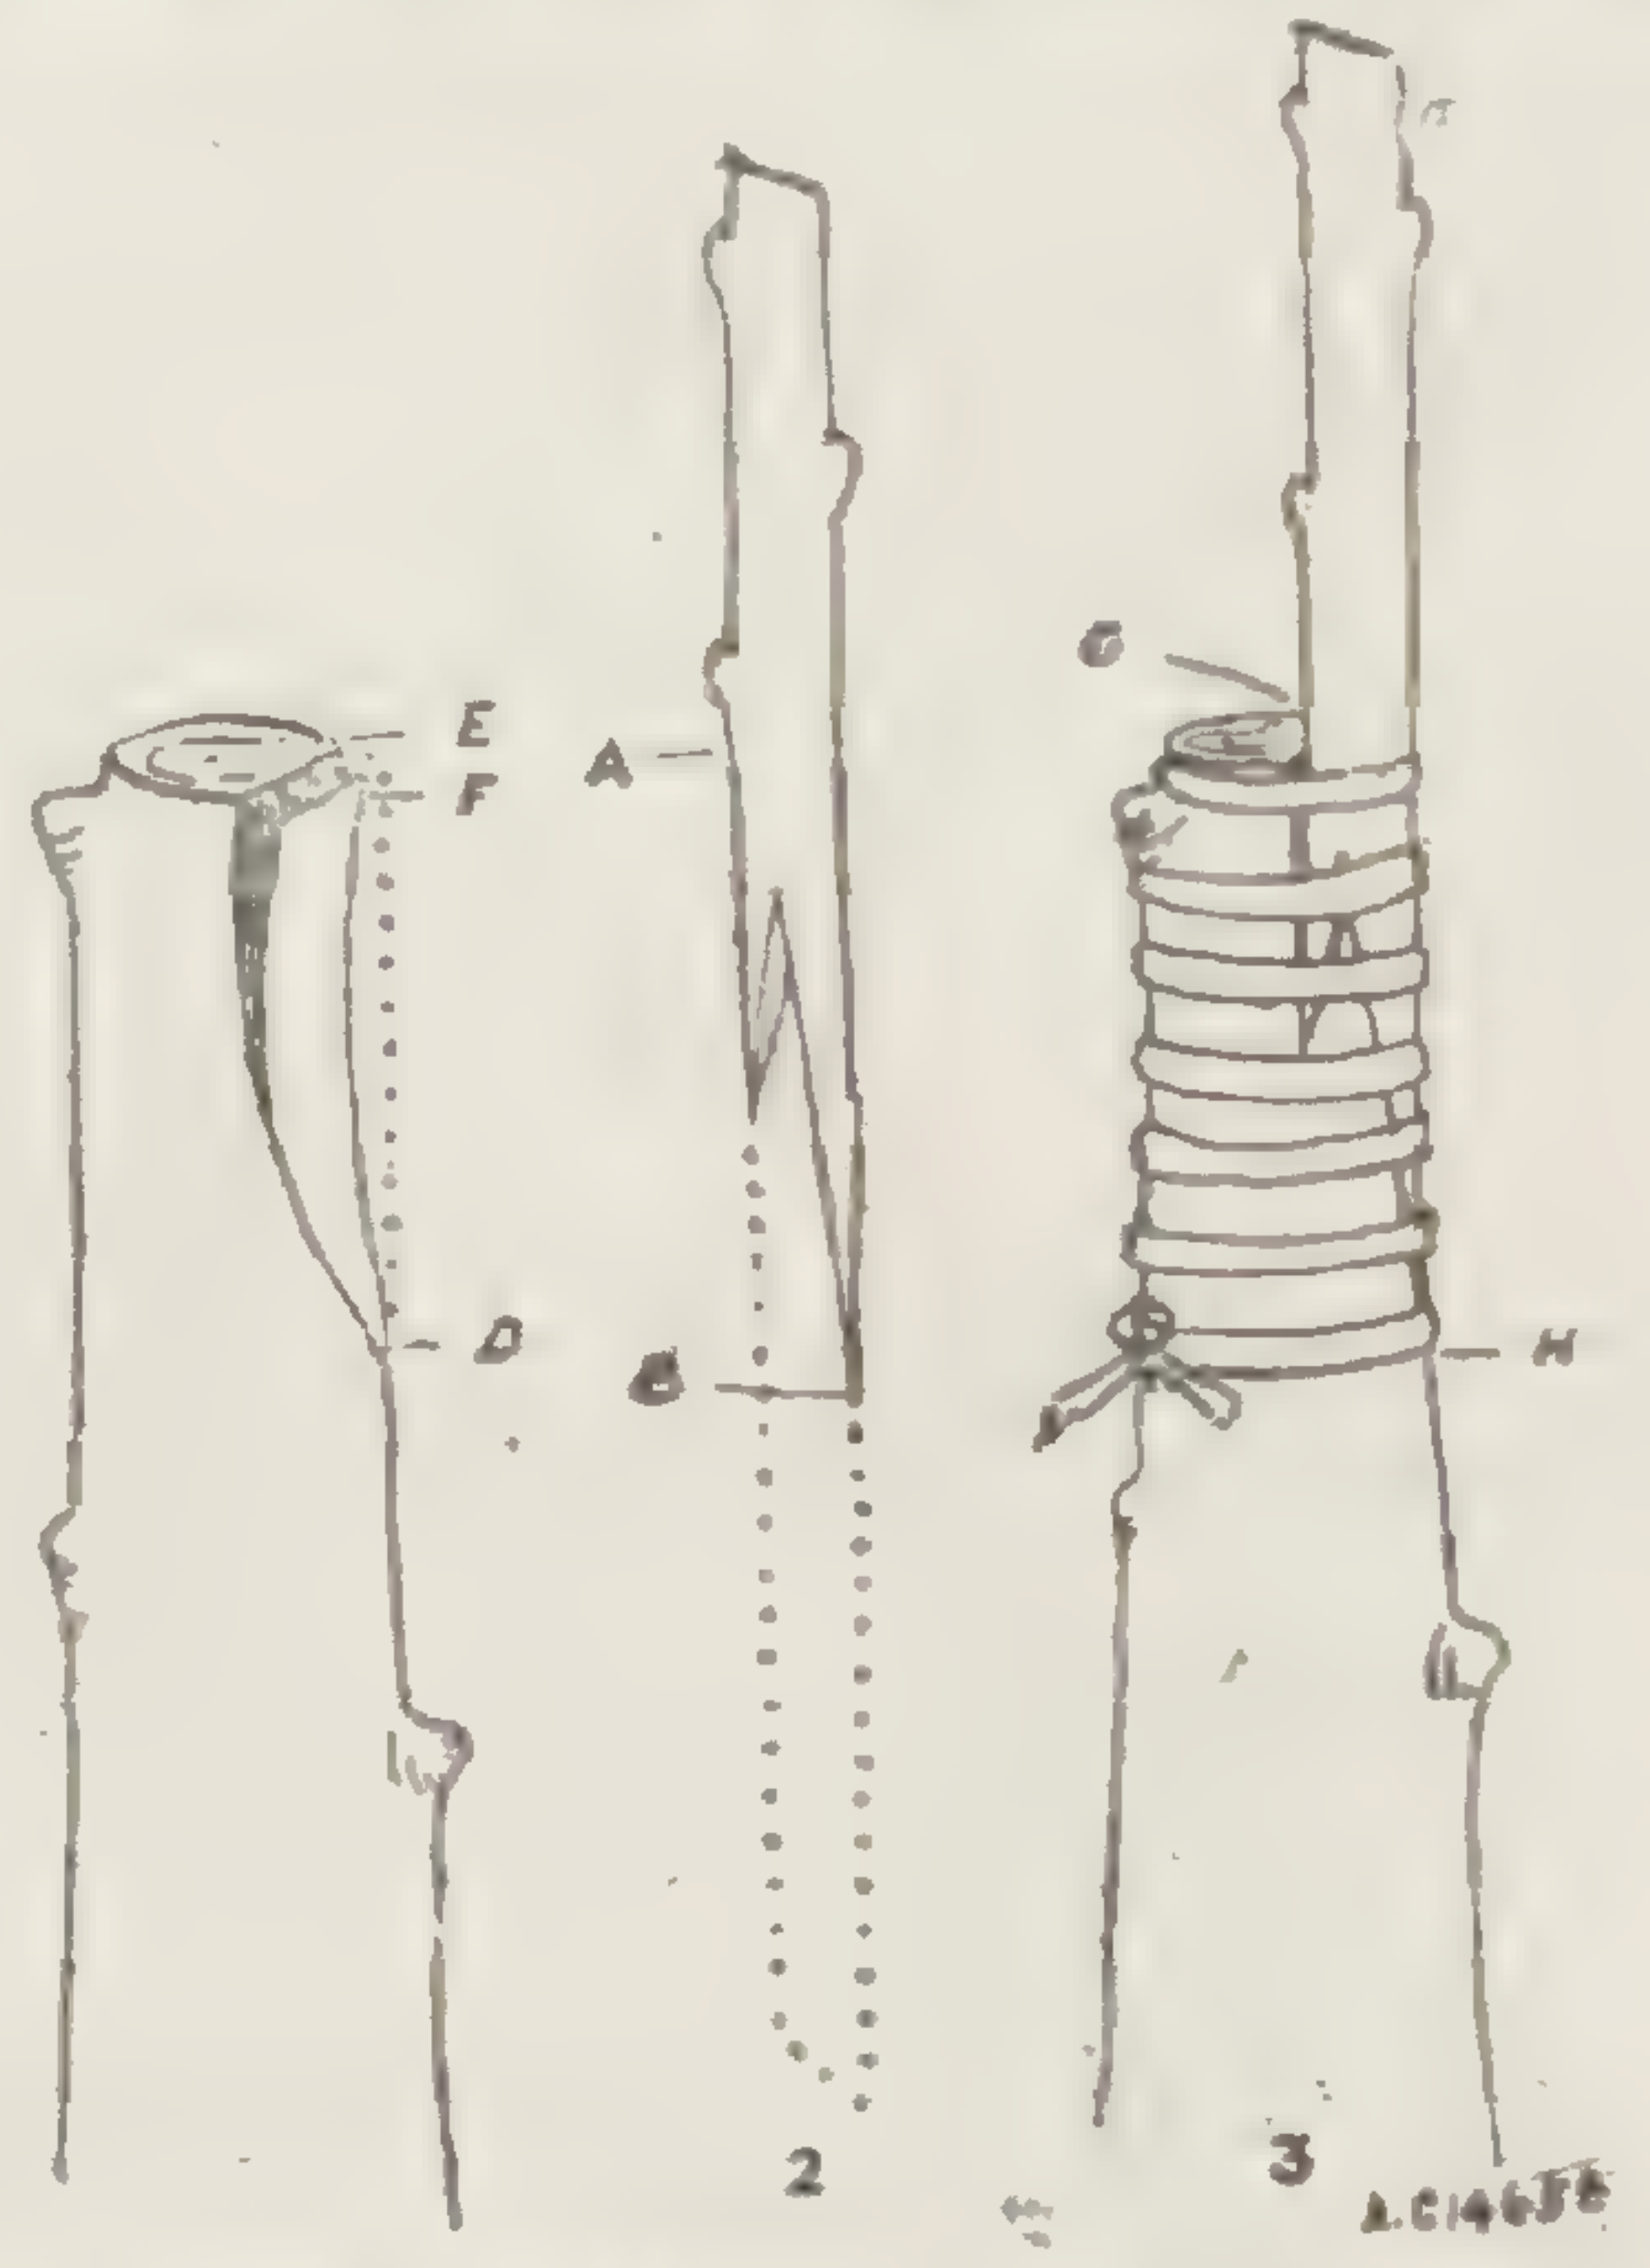
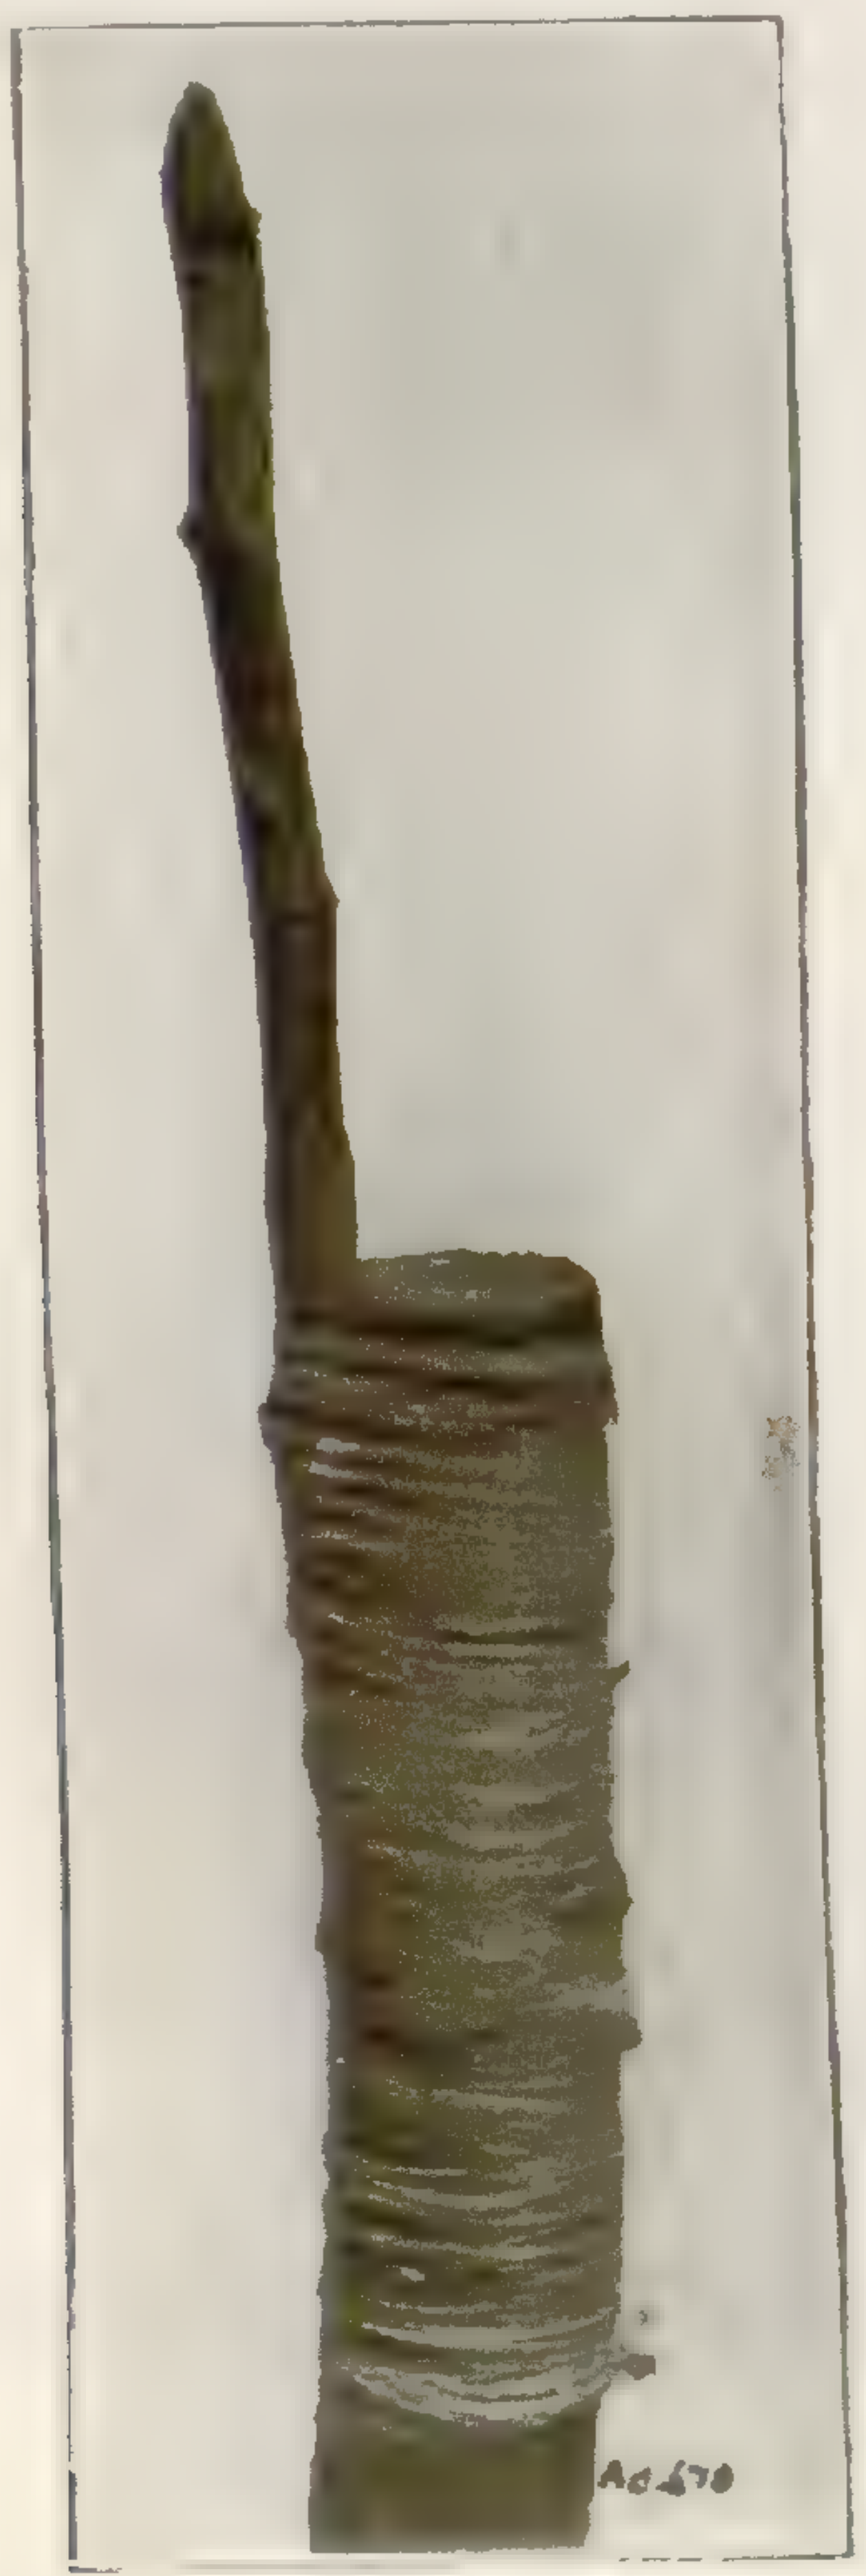
of a novelty, is likely to prove useful. The foregoing make up a baker's dozen, which hardly exhausts the list, but as real January bloomers they are not excelled.

SOLANUM WENDLANDI.—W. S., Alresford: This fine solanum is of easy culture, and may be readily flowered in 4in., 5in., or 6in. pots. Cuttings made of good hard wood of the previous year's growth should be inserted in sandy soil in January or February, and placed in a temperature of 60 deg. In this heat they should be kept until growing freely. When well established 55 deg. will not only suffice, but be a more suitable temperature. When the flower buds are showing, usually in June, the ordinary unheated greenhouse is the best place for the plants, and here they should be given plenty of air and light, and be kept free from red spider, the latter pest being very fond of this solanum. Another plan, and in some measure a better one than the foregoing, is to take plants that were struck the previous season and cut them back to within two or three inches of the base, and start them in a warm house; as soon as growth commences shake away the old soil, pot each plant in new material, and treat as in the case of cuttings.

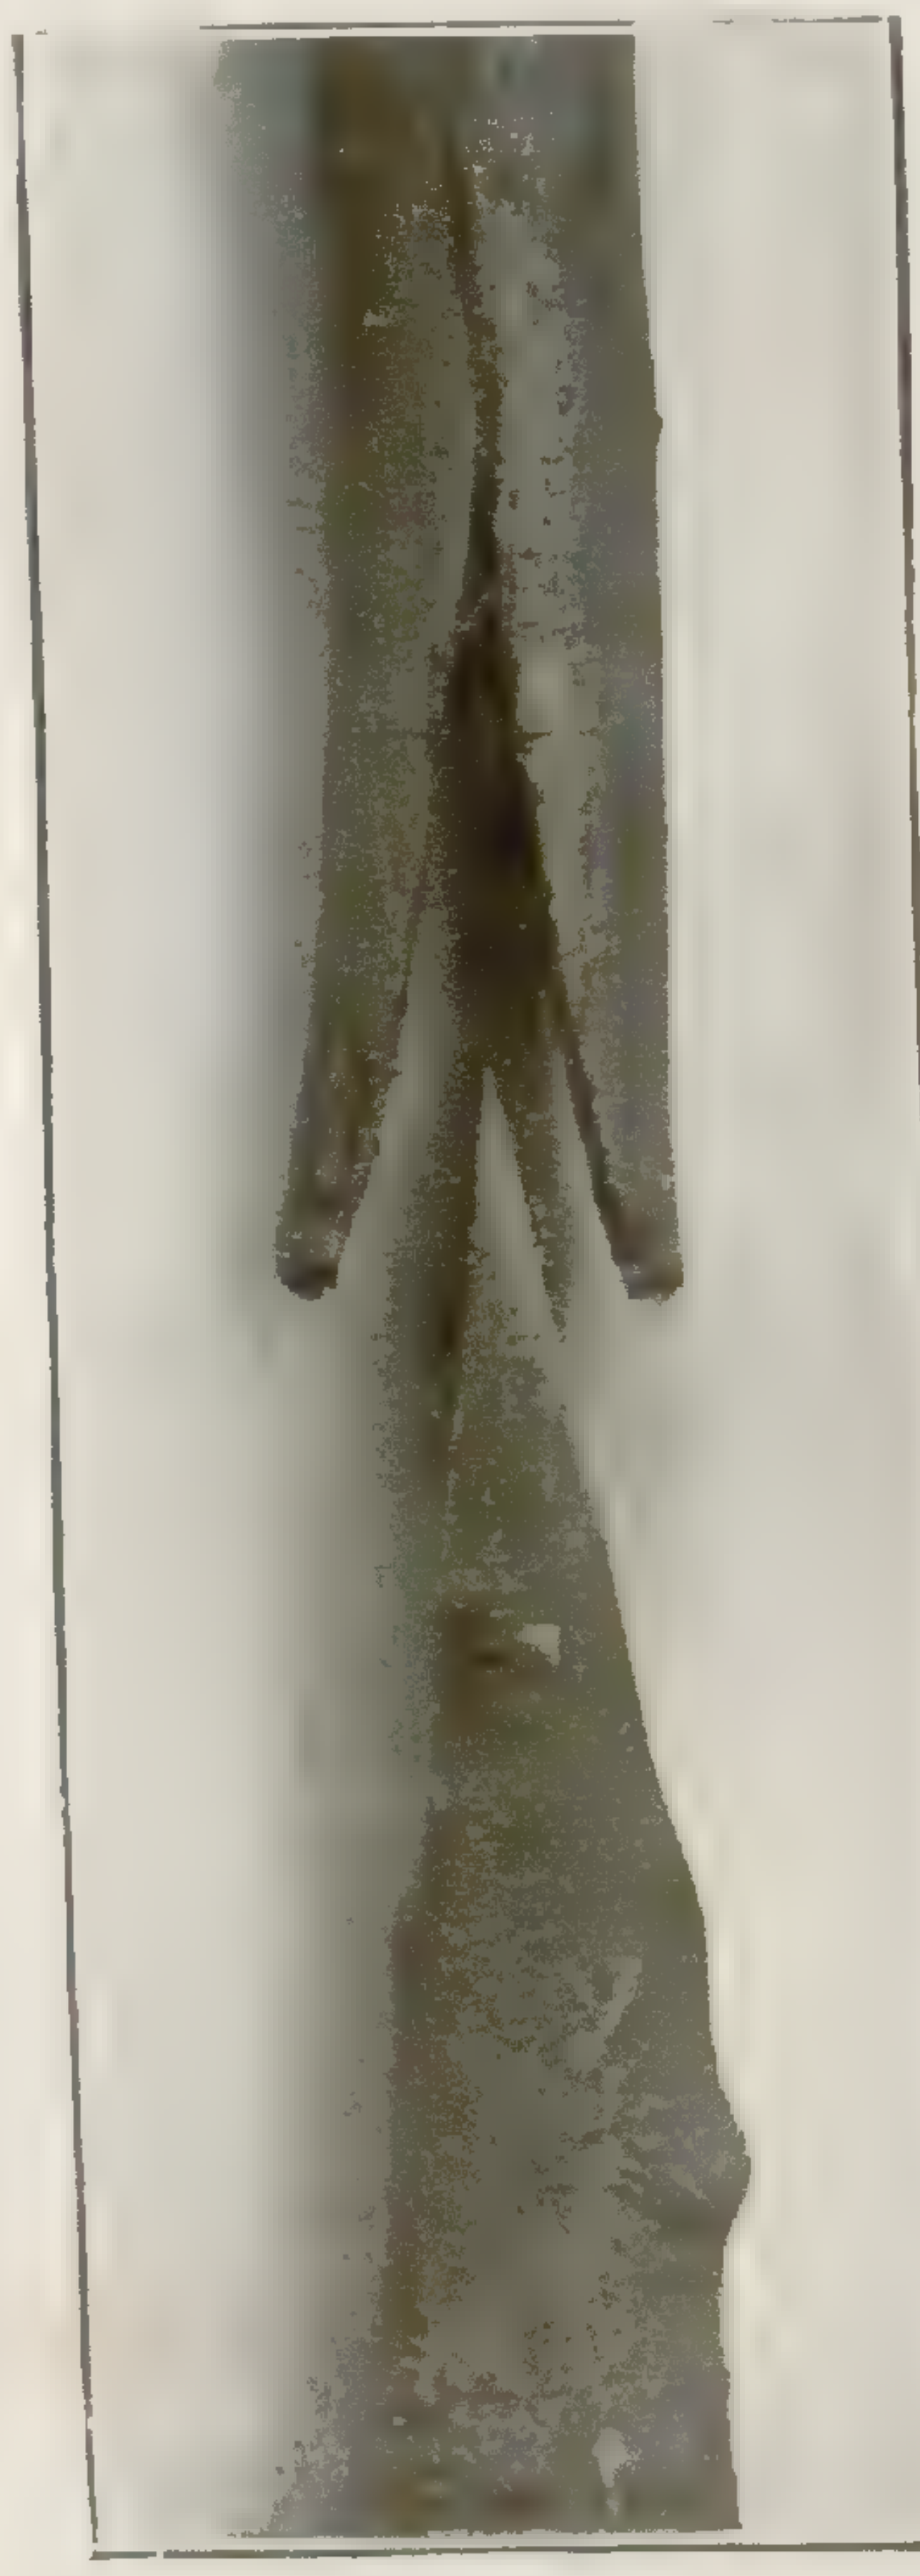


NOTCH GRAFTING FRUIT TREES.

Fig. 1, Stock. Fig. 2, Scion. Fig. 3, Scion fixed to stock.



CROWN GRAFTING FRUIT TREES.



SADDLE GRAFTING FRUIT TREES.

GRAFTING FRUIT TREES.—E. F., Weston-super-Mare.—Grafting is the most satisfactorily accomplished towards the end of March or early in April, but it is necessary that a beginning should be made some time previous to ensure the graft and the stock being in about the same stage of development. The grafts, or scions, as they are variously designated, should be cut from the trees in February, tied in small bundles, correctly named with labels of wood or zinc, and inserted to about two-thirds their depth in a border on the north side of a wall. Two or three weeks later the stocks on which the scions are to be put should be cut back. This should be done whether they are small stocks used for the purpose of increasing the number of trees, or old trees of varieties that are not useful or suitable. The great thing to remember in grafting is that the white sappy wood (known as the inner bark) of the scion should come into as close and continuous contact as possible with the inner bark of the stock. The cut portion of the one should correspond, as far as possible, with the cut portion of the other, so as to ensure a good fit. Make the graft firm by binding with raffia or soft string. The outline illustration here given shows the method known as notch grafting, and it is one very suitable for adoption when the size of the graft or scion is about the same as or a little smaller than the branch it is to be placed upon. Few words are needed to assist the diagram. Where the branches are larger the most general, and, indeed, the best way of grafting established trees with finer varieties is by the process known as crown grafting. To perform this operation successfully the scions should be prepared as for the previous method. About the middle of March, saw or cut off the branch or stock (see second illustration), and be careful not to bruise the bark in doing this. When the saw is used, the top of branch or stock should be cut smooth with a sharp knife. Then cut the scion very thin for two or three inches, and then shave off one edge quite straight, this edge to come in contact with the undisturbed edge of the incision. If too much wood is left, shave it down until nearly all is removed. With the blade of a budding knife make a straight cut where the scion is to be inserted, and with the handle lift the bark on one side of the cut, just sufficient to admit the graft or scion, which is run down, and keep the straight edge of the latter with the undisturbed edge of the cut. Fasten the scions securely with strands of bast, and then cover the junction and top of the stock with one of the preparations for grafting. Cover with a little moss if clay is used, to prevent it cracking and falling off. When growth has commenced, support the new shoots by means of sticks fastened to the stock. The third illustration shows the method of saddle grafting, when stock and scion are of similar size.

SALADING.—S. E. S., Newport, I. of W.: A useful little book dealing with the cultivation of salading in the open or hotbeds, and under glass, and also indicating the French, as well as British, methods, is "Salads and their Cultivation," post free for 1s. 2d. (1s. 9d. cloth) from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

NAMES OF PLANTS.

L. C. H., Chilworth: 1, Helleborus guttatus; 2, H. colchicus.

B. M., Middleton.—1, Odontoglossum ardentissimum; 2, Cypripedium Leeanum.

G. C., Stratford-on-Avon.—1, Hamamelis arborea; 2, Helxine Solieroli; 3, Adiantum fissum.

F. E. F., Hassocks: 1, Cypripedium aureum virginale; 2, Odontoglossum Warnhamense; 3, probably O. concinnum—a poor flower.

R. S. S., Bebington.—1, Asplenium Richardsoni; 2, Selaginella cæsia; 3, S. Mertensi; 4, Gleichenia Mendeli; 5, G. dicarpa longipinnata; 6, Blechnum brasiliense.

H. A. S., Newbury.—1, Thuya dolobrata; 2, Sequoia sempervirens; 3, Cryptomeria elegans; 4, Juniperus Sabina; 5, Cupressus lusitanica; 6, C. Lawsoniana pendula.

* With rain. † Without rain.

The average fall for the last eight years is 32.50 inches. The heaviest rainfall during the year, in the least time, occurred on Saturday, June 4, when .37 fell in 35 minutes, from 4.5 to 4.40 p.m. The readings are taken each morning at 9 a.m. Rain gauge (Glaisher), funnel, 8 inches in diameter. Height of top above ground, 1ft.; above sea level, 180 feet. Thermometer, 3 feet above ground in the shade.

The 11 hottest days during the year were May 20, 74 deg.; May 23, 72 deg.; June 20, 77 deg.; June 18, 72 deg.; July 14, 74 deg.; July 13, 73 deg.; August 5, 72 deg.; August 11, 75 deg.; August 12, 72 deg.; August 13, 72 deg.; August 14, 72 deg. January 26 was the coldest day during the year, when the temperature did not reach higher than 25 deg., or 7 degrees of frost. The six coldest nights during the year were January 26, with 19 deg. of frost; Jan. 25, 14 deg.; Jan. 21, 9 deg.; November 21, 8 deg.; January 20, 7 deg.; and January 30, 7 deg. During January we had 13 nights with frost and 5 days when the temperature was under freezing point. In February we had 13 nights with frost, in March 12 nights with frost, in April 5 nights, May 1 night, November 15 nights and 1 day under freezing point, in December 3 nights.

FORTHCOMING ENGAGEMENTS.

MONDAY, February 6.—Dorchester Horticultural Society meets.

National Chrysanthemum Society.—Annual meeting at Carr's Restaurant, Strand, London, 7 p.m.

North of England Horticultural Society.—Meeting at Leeds of Scientific Committee, 5 p.m.; Plant and Flower Committee, 6 p.m.; Fruit and Vegetable Committee, 7 p.m.

TUESDAY, February 7.—Scottish Horticultural Association meets.

FRIDAY, February 10.—Royal Gardeners' Orphan Fund.—Annual Meeting and Election at "Simpson's," Strand, London, 3 p.m.: Committee Dinner at 6, for 6.30 p.m.

TUESDAY, February 14.—Royal Horticultural Society.—Fruit, Floral, and Orchid Committees meet 12 noon; Annual Meeting, 3 p.m.; Scientific Committee, 4 p.m.

Horticultural Club.—Annual Meeting at Hotel Windsor, 5 p.m., and Annual Dinner, at same hotel, 6 p.m.

CATALOGUES RECEIVED.

C. ENGELMANN, SAFFRON WALDEN, ESSEX.—During 1910 Mr. Engelmann maintained a permanent exhibit of carnations at the Brussels exhibition, and sent over no fewer than 40,000 blooms. Some of his groups, as well as portraits of new perpetual carnations, figure in his catalogue just issued.

JOHN R. BOX, DERBY ROAD, CROYDON.—A handy little catalogue of vegetable and flower seeds, together with choice begonias, liliums, gladioli, etc.

JNO. JEFFERIES AND SON, CIRENCESTER.—Although established over one hundred years this firm is well up-to-date in the matter of seed novelties, particularly among sweet peas and other flowers; vegetable seeds and sundries are included in the new catalogue.

CHAS. W. BREADMORE, WINCHESTER.—Although Mr. Breadmore lists various flower and vegetable seeds, as well as farm crops, chief place is given in his catalogue to sweet peas; he appears to have won seven gold medals for the latter flowers, besides other awards in 1910.

W. ATLEE BURPEE AND CO., PHILADELPHIA, U.S.A.—An interesting seed catalogue in which are listed a large number of varieties of vegetable and flower seeds that do not appear in British catalogues; for instance, water melons, squashes, Indian corn, pumpkins, and spring cucumbers are given a large amount of space and freely illustrated. New waved sweet peas, many of American origin, also figure prominently.

H. CANNELL AND SONS, SWANLEY.—Chrysanthemums are always with us, and one season begins before the last has finished. The descriptive list of varieties from the Messrs. Cannell includes a number of novelties for the present year, and, as showing the popularity of "singles," the list opens with twenty members of this useful section.

GEO. COOLING AND SONS, BATH.—This firm lists a very wide range of flower and vegetable seeds, all of which are described and many illustrated.

RIVOIRE AND SON, RUE D'ALGERIE, FRANCE.—A wholesale catalogue of novelties that includes new cactus and collarette dahlias, miniature geraniums, carnations, gladioli, etc., etc.

CHARLES TURNER, SLOUGH.—A comprehensive catalogue of vegetable and flower seeds, with excellent lists of seed potatoes and garden tools and sundries.

J. R. PEARSON AND SONS, LOWDHAM, NOTTS.—Many of the fine illustrations in this firm's useful catalogue are reproductions from photographs taken by Mr. J. D. Pearson, and they represent fine varieties or novelties in flowers and vegetables.

JOHN K. KING AND SONS, COGGESHALL.—Under the title of "Manual of Gardening," this Essex firm issues a substantial catalogue of vegetable, flower and farm seeds, roses, and sundries. Hundreds of illustrations adorn the 150 pages, and, in addition to descriptions and cultural notes, special attention is devoted to lawns for sports, etc.

G. LETTS, HADLEIGH, SUFFOLK.—Two lists have reached us, one devoted to a selection of vegetable and flower seeds, and one to plants, roses, and fruit trees.

Send for descriptive Catalogue of 80 varieties with particulars when to stop them.

C. ENGELMANN, CARNATION GROWER,
SAFFRON WALDEN.

TO LET.—Facing S.S.W.; on Great Central and Metropolitan Joint Railway, an old-fashioned KITCHEN GARDEN, in excellent and good repair, consisting of four acres, all surrounded, and divided up into compartments by high walls covered with well-matured fruit trees of various kinds. In garden are four large vineries, 1 peach house, 5 plant houses (1 new), 8 pits, and numerous spare lights. Gardener's cottage (6-roomed), bothy, and sheds. Houses heated with hot-water. Adjoining across the road are 5½ acres of orchard, with sheds and cart stable, used in connection with the kitchen garden. Excellent well in garden and an additional water supply if required can be obtained by arrangement. Order to view can be obtained with all particulars from the Agent, Shardelces Estate Office, Amersham.

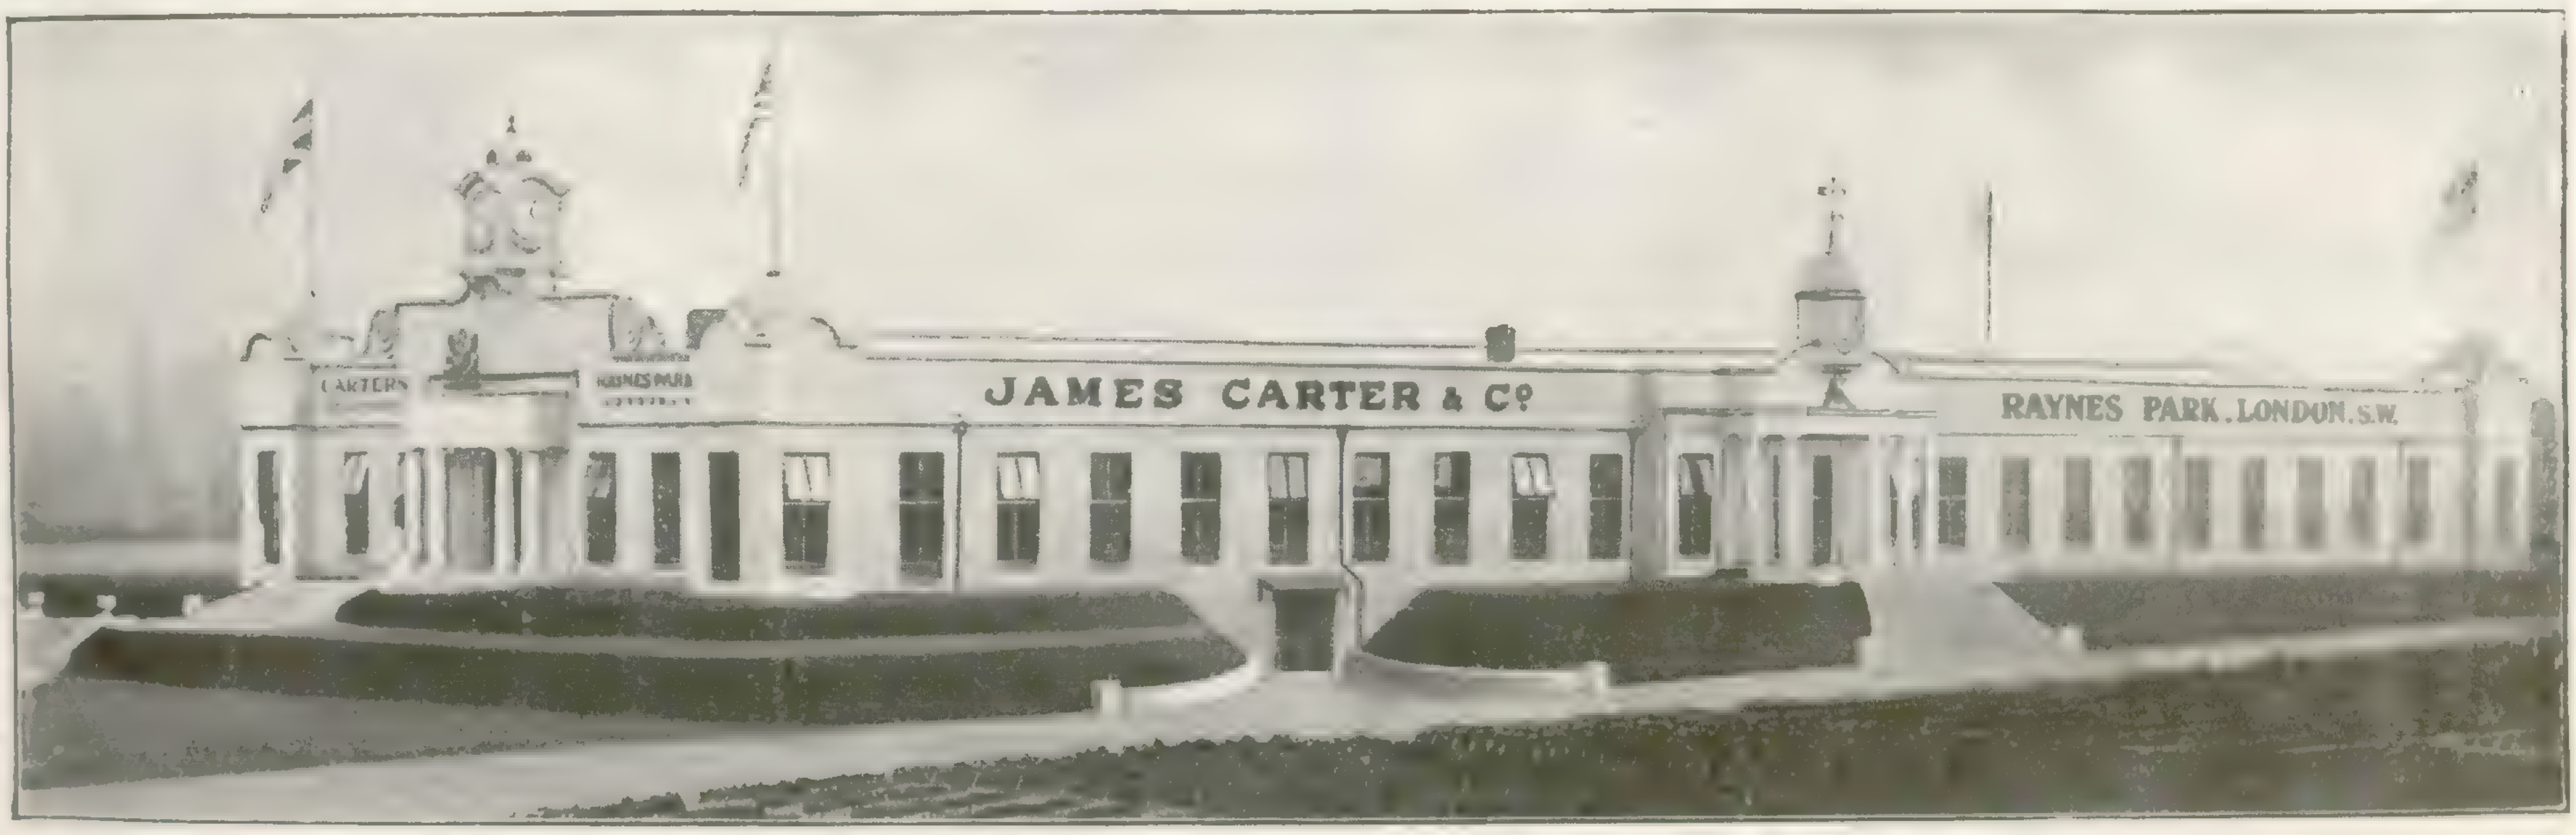
HOW
Carters Tested Seeds
ARE TESTED.



Carters New Offices and Seed-Testing Grounds, Raynes Park, London, S.W.

The founder of our Firm, JAMES CARTER, was, we believe, the first to guarantee the germination of his Garden Seeds seventy-five years ago; the practice, as amplified in the following illustrations, is still conducted annually by our firm.

1st Test—Peas Germinating on warm moist felt.

2nd Test Peas Germinating in mould.

3rd Test—Growing to maturity in our Experimental Gardens.

A sample of all Horticultural and Agricultural Seeds is grown in our Testing Grounds to full maturity, so that we may assure ourselves of the quality and trueness of each variety.

By examining our trials from time to time we know exactly how the produce of our Seeds should appear in the gardens of our Customers all over the world, making allowances for the various climates, and by the aid of our comparative tests (we try all British and Continental Seeds of repute) we assure ourselves that our Customers are growing "the best and only the best" and "Tested."

VOL. LIV.—No. 2,989. SATURDAY, FEBRUARY 11, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Royal Horticultural Society's Report,

In some respects the report that will be presented to the Fellows of the Royal Horticultural Society assembled at the annual meeting on Tuesday next bears a strong resemblance to a considerable number of similar records. It could not well be otherwise, for, as in many previous years, the Council have to record an immense amount of useful work satisfactorily accomplished, a large accession of new Fellows, and financial results that have enabled them to bring the year's work to a close with a substantial profit balance. In an early paragraph the Council refer to the lamented death of King Edward VII., who was a patron of the society, and evinced an active interest in its work, and state that they have subscribed one hundred guineas in the name of the society to the Lord Mayor's Fund for a National Memorial. Reference is also made to the death of Baron Schröder and the splendid services he rendered in connection with the provision of the Horticultural Hall, and to the fact that to perpetuate his memory the Council have established a Schröder Life Pensionship under the rules of the Royal Gardeners' Benevolent Institution. The Council have, we are pleased to learn, established a scheme of annuity pensions for members of the society's staff under which pensions are provided by equal contributions from the salaries of the officers concerned and the funds of the society, such "pensions maturing at the age of 65, or at death, if occurring before." Prominence is given to the Wisley Gardens and the work that is being carried on therein. They were, it is stated, visited by largely increased numbers of Fellows during the year; research and experimental work are being regularly carried on, and the reports on soil sterilisation and on the trial of various plants are promised on an early date. The School of Horticulture at Wisley is described as "one of the most important and beneficial branches of the work done by the society," the tuition given being now much wider in its scope than was possible before the erection of the laboratory. The several exhibitions that were held during the year are passed under review, and with reference to the autumn fruit show, regret is expressed that, with so fine a display of British-grown fruit, such a comparatively small number of Fellows should have visited the exhibition. The general public also attended in small numbers, as indicated by the fact that the sum of £17 19s. only was received for admission during the two days. This year the fruit show will be held on October 10 and 11, the first day being one of the ordinary Tuesday's meetings. Both the Temple and Holland House exhibitions were, as we have already recorded, described as unqualified successes, the number of visitors being in excess of that of any previous year. As the grounds at Holland House are no longer available for the purposes of the society's summer show, the Council have secured Olympia for the purpose, and are making strenuous endeavours to so arrange the details that the exhibition may be a complete success both horticulturally and financially. The Council have for the first time an opportunity of admitting the general public to one of the society's great summer exhibitions in the evening at a popular price; and as they have taken advantage of it, we trust they will receive an ample reward for their enterprise. The numerous awards by which the society recognise merit have been increased by the founding of a card of "Recognition of Diligent Interest in Plants." This card has been provided in response to frequent applications by school authorities for some token of encouragement of work with plants among their scholars, and is to be awarded to the boy or girl who, in the yearly competitions in plant cultivation, garden plot keeping, or Nature study has secured the first prize. This new award is of something more than passing interest, proving, as it does, that the Council, while devoting the closest attention to the advancement of the higher branches of horticulture, fully appreciate the importance of stimulating an interest in gardening among children attending elementary schools in rural districts. The annual progress, as represented by the increase in the number of Fellows, and in the income from subscriptions, is admirably shown in the usual table in the report, and cannot fail to afford satisfaction to those who appreciate the work that is being done by the society. There is no occasion to analyse the figures, as it will suffice to say that the total loss from death and resignation was 495, and that the number of Fellows and Associates elected, and the societies received into affiliation during the year was 1,503, or a net increase of 1,008. The loss of income from deaths and resignations was £687 4s. 6d., and the gain from the Fellows elected £2,292 13s. 6d., or a net increase in income of £1,605 9s. The number of Fellows in December was 12,403, and the amount received as annual subscriptions during the year £16,500. The approximate value of the investments of the society are £41,970 7s., and, in addition, there are the funds belonging to the several trusts that are administered by the society. This will probably appear an enormous sum to many horticulturists, and a few may consider that it would be better were the expenditure to more closely balance the income. The reserve is really none too large, having regard to the responsibilities of the society, and the Council and officers may be heartily congratulated on their prudence as well as the administrative ability they have shown and are showing in the management of the society's affairs.

MR. W. G. P. CLARK.

Mr. W. G. P. Clark, the hon. secretary of the Hitchin Chrysanthemum Society, is a strenuous amateur horticulturist, and, though he has a love for roses, sweet peas, and other beautiful flowers, his great hobby is chrysanthemum culture. For many years he has been a successful competitor, not only staging superb flowers, but also excellent groups. The latter he sets up at Hitchin, and has won premier award for them on several occasions. But Mr. Clark has gone farther afield, and at the National Chrysanthemum Society's great November shows he has time and again come to the front in the amateur's division. As far back as 1899 he won the prize (an oil painting of the flower, presented by Mr. J. T. Simpson) for the best bloom in the show at the Crystal Palace, with a grand example of Mrs. W. Mease. At Hitchin Mr. Clark's worth in a secretarial capacity is well understood and highly appreciated, and he carries out his duties in a very pleasant as well as businesslike manner.

R.H.S. Annual Meeting.—The annual meeting of the Royal Horticultural Society will be held at the Horticultural Hall, Vincent Square, on Tuesday next (February 14) at three o'clock. The list of nominations for election as president, vice-presidents, members of council, and officers is issued in accordance with bye-law 74; but as the number of names proposed does not exceed the vacancies to be filled, there is no need for a ballot. The nominations are as follows: As president, Sir Trevor Lawrence, Bart., K.C.V.O., V.M.H.; as treasurer, Mr. J. Gurney Fowler, J.P.; as secretary, the Rev. W. Wilks, M.A.; as members of council, Sir George Holford, K.C.V.O., C.I.E., Mr. H. B. May, V.M.H., Mr. E. A. Bowles, M.A.; as vice-presidents, the Duke of Bedford, K.G., the Right Hon. Joseph Chamberlain, the Right Hon. the Earl of Ducie, the Right Hon. Lord Rothschild, Leopold de Rothschild, Esq., C.V.O., Sir John T. Dillwyn-Llewelyn, Bart., V.M.H.; as auditor, Mr. Alfred C. Harper.

January in the North.—The exceedingly fine and abnormal weather experienced during January in the North of Scotland, writes our Aberdeen correspondent, has been the subject of not a little comment. Undoubtedly the North-East of Scotland has long been noted for the fine weather that occasionally prevails in the month of January, but, really, it would seem that the opening month of 1911 beats all records in regard to the abnormally high temperature that has prevailed. January, if not the windiest, is, as a rule, our coldest month. Our rainfall has varied in various districts from 1½ to 1¾ inches, but the average for the month during the past 40 years has been about 2in. The lowest record for this month is that of 1880, 0.26in., and the highest (1877) 4.35in. The sunshine experienced in the month under review has been greatly in excess of average, and the evening skies have shown many exquisitely beautiful sunsets and fine displays of the Aurora Borealis. It has, indeed, been a pleasant time for the dead season of the year, and should the same conditions prevail during February and March, we shall have experienced a winter of extreme mildness, but that remains in the lap of the gods.

Honour for Sir Albert Rollit. A Knight Commandership of the first class of the Order of St. Olaf has been conferred upon Sir Albert Rollit by the King of Norway, for services rendered in connection with the Norwegian Chamber of Commerce.

"Kew Bulletin."—The current issue (No. 1, 1911) of this publication has about double the usual number of pages, and is of much interest. The contents include two contributions to the flora of Siam, which occupy sixty pages, and form a substantial part of the contents. The first of these is by Dr. A. F. G. Kerr, who resides at Cheingmai, the capital of Northern Siam, and it includes a sketch of the climatic conditions that obtain, and a description of the characteristic features of the vegetation of Doi Sootep, a mountain which rises to a height of 5,500 feet, and is about two miles distant from Cheingmai. The second contribution is a list of Siamese plants, with descriptions of new species, by Mr. W. G. Craib. Hitherto the only guide to the flora of Siam was the list compiled by Dr. Williams, and published between five and six years since, and in view of the more recent collections, was regarded as incompletely representing the Siamese flora. Within the past few years large collections of plants have been received at Kew from Dr. Kerr and other collectors, and the additional materials now in the Kew Herbarium have rendered it possible for Mr. Craib to prepare a comprehensive list, which includes a considerable number of species not previously described. This list will, it is hoped, be completed during the current year, and is to be regarded as supplementary to that published by Dr. Williams.

Proposed National Daffodil Society.—In connection with the proposal to form a National Daffodil Society, Mr. W. B. Cranfield, Enfield Chase, has convened a meeting of amateur and professional daffodil growers for Tuesday, February 14. The meeting will be held in No. 3 Committee Room at the Royal Horticultural Hall immediately after the annual general meeting of the R.H.S.

National Sweet Pea Society. We are informed that the Sweet Pea "Annual" and the Schedule of Prizes for 1911 will be sent to all members of the N.S.P.S. at the end of the present week. Since the annual general meeting no fewer than 63 new members have joined the society, and several additional local societies have become affiliated. A goodly number of sweet peas have been sent to Guildford by raisers at home and abroad, consequently the society's trials promise to be as interesting as in any previous year. For particulars of membership and affiliation our readers are referred to the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford.

British Gardeners' Association. Mr. J. Weathers, the general secretary, informs us that an important meeting of gardeners will be held at the Cobden Café, Corporation Street, Birmingham, on Saturday, February 18, 1911, at 7.30 p.m., to reorganise the local branch of the British Gardeners' Association. Since the meeting on January 21, a large number of gardeners in the Birmingham district have joined the association, and the branch now promises to be one of the strongest and most enthusiastic in the country, rivalling London, Blackburn, Leeds, etc. The local secretary is Mr. J. D. Jones, 8, Acacia Road, Bournville, Birmingham, from whom forms and all particulars may be obtained.

Visitors to Kew in 1910.—According to the Kew "Bulletin" 3,546,302 visitors to the Royal Botanic Gardens were recorded during the year 1910. These figures show an increase of 186,081 over those of the previous year, and are the largest numbers on record. During the ten years 1900-1909, 20,023,749 persons have visited the gardens, giving an average of 2,002,374. The total number of visitors on Sundays during 1910 was 1,614,085, and on week days 1,932,217. Sunday visitors have increased by the large number of 229,716, while the number of visitors on week days show a decrease of 43,635 from the figures of the previous year, in spite of the fact that there were five Bank Holidays, when as many as 424,010 persons visited the gardens, as against 242,372 persons on the four Bank Holidays in 1909. The largest attendance on any one day was 152,454 on Whit Monday, May 16, being nearly 40,000 in excess of the highest number previously recorded for a single day. The smallest number on any one day was 290 on November 3. The largest Sunday attendance was 91,058 on May 15, and the smallest 251. The former figures are about 20,000 in excess of those recorded for last year.

Barnsley Chrysanthemum Society held its annual meeting a few days since, and, according to the balance-sheet presented, the receipts, including the balance from the previous year amounted to £235 10s. 10d. and the expenditure to £171 0s. 4d., leaving a balance of £64 10s. 6d. This balance showed a falling off of £24 in the receipts as compared with 1909, both subscriptions and the amount taken at the doors being less.

Women and Horticultural Teaching.—Miss Lilian Hamilton, the Warden of the Studley Castle Horticultural College, complains of the difficulty experienced in obtaining highly educated women as heads of departments. She states that in common with others in similar positions she is compelled, at present, to employ men gardeners as teachers, but for various reasons the work could be more appropriately undertaken by women. Miss Hamilton therefore expresses the hope that a larger proportion of the women who wish to follow a career of usefulness, or who find it necessary to earn a living, will qualify to fill posts carrying with them salaries of £300 a year, and perhaps, in future, even more.

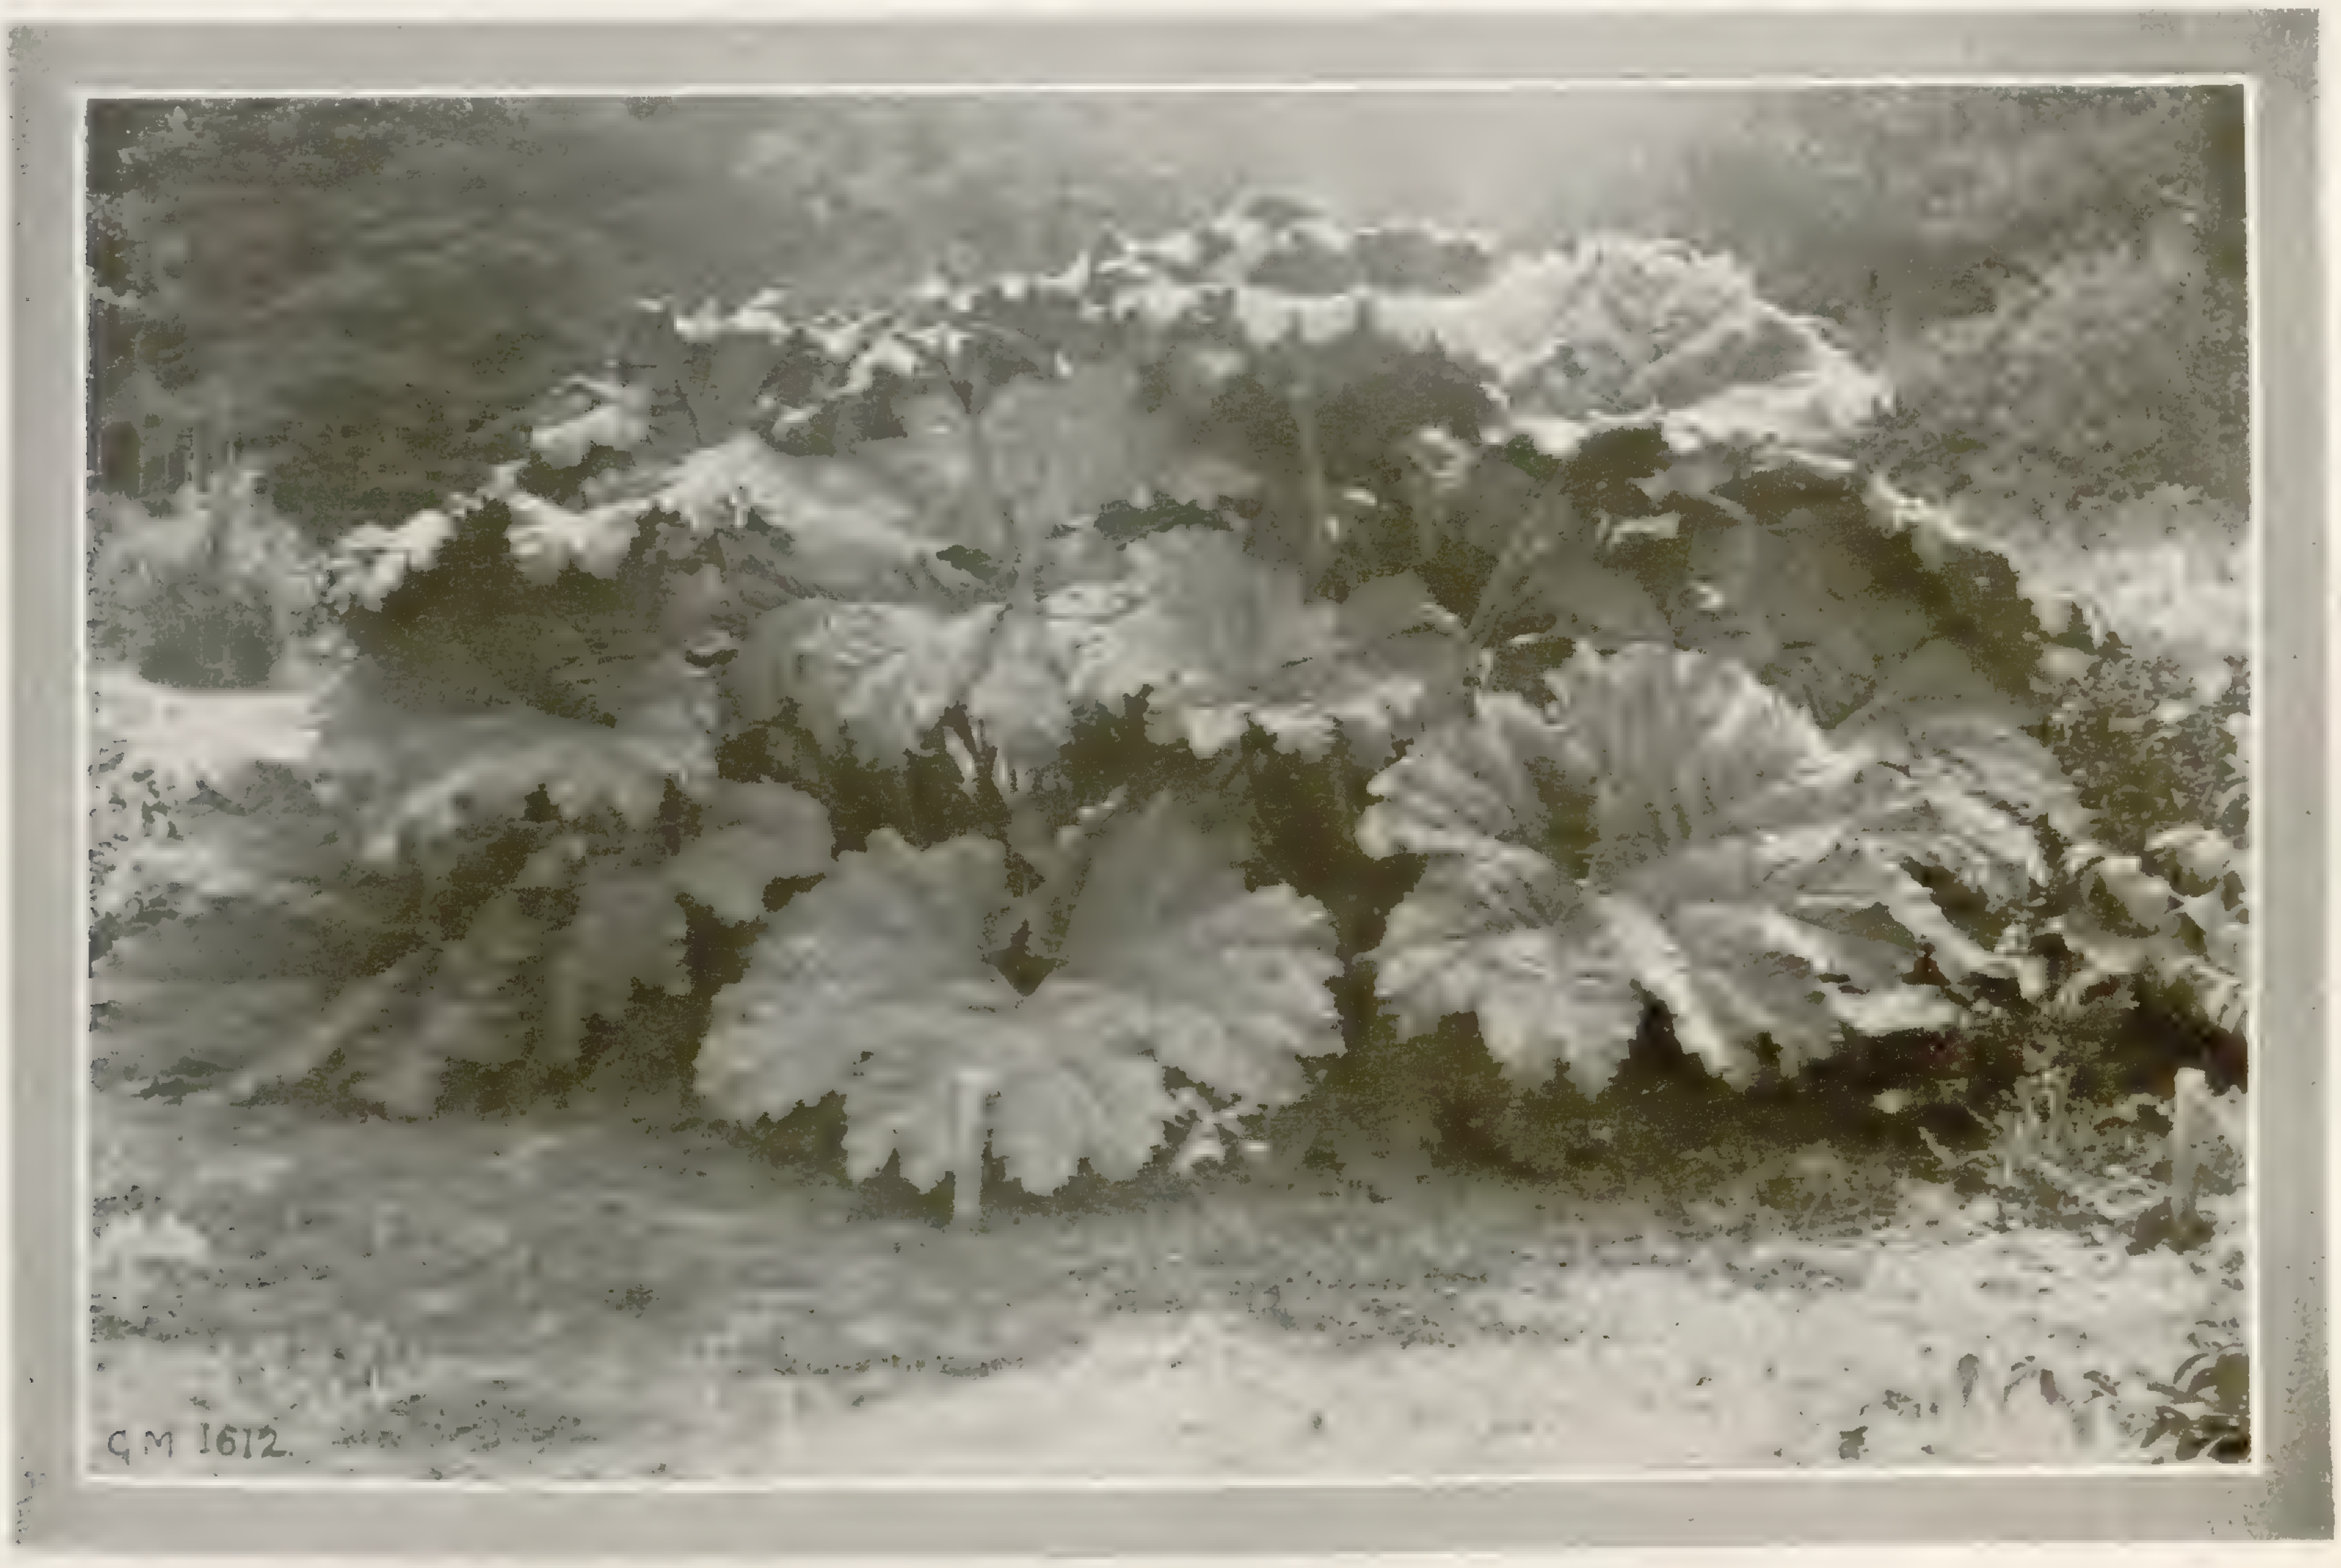
A Northern Carnation Conference will be held in the Imperial Hotel, Manchester, on Saturday, February 18, when the following papers will be read and discussed: "The Florists' Ideal Carnation" and "The Amateur Status." The meeting will be held under the auspices of the Northern Section of the National Carnation and Picotee Society.

Wisley School of Horticulture.—During the past year thirty-eight young men, between the ages of 17 and 22, attended the Royal Horticultural Society's School of Horticulture, and of these eleven were successful in gaining the society's diploma. With the exception of one all have gone into some business or work connected with horticulture or forestry. Some have entered private gardens, others nurseries, others are taking up fruit growing on their own account, either at home or in the Colonies, and so on. The course, which extends over two years, includes a training in the elementary principles of scientific horticulture, and in their practical application to all branches of gardening work. About eleven hours a week are spent in studying scientific principles, and twenty-nine in practical garden work, every student being required to take a share in the ordinary work of the garden. The school terms begin on the last Monday in March and the last Monday in September, and only at these times can new students be admitted. For the two years course an admission fee of five guineas is paid, students boarding and lodging at their own expense. Particulars of the course, with intimation as to when vacancies are likely to occur, may be obtained from the Secretary, Royal Horticultural Society, Vincent Square, S.W.

New Master of the Fruiterers' Company. — We learn that Colonel Vickers Dunfee has been elected Master of the Fruiterers' Company for the present year.

Great Summer Show at Olympia. — The grounds at Holland House, Kensington, being unavailable for an exhibition this year, the Council of the Royal Horticultural Society have secured the great hall at Olympia, Addison Road, Kensington, for July 4, 5, and 6. In this show's arrangements will be manifested the society's latest endeavours to broaden its influence, as the show is to remain open until ten p.m. on the first two evenings (July 4 and 5) at the popular price of admission, 1s., the first time evening shows have been held. So a very large proportion of the friends of the society and public, who cannot attend during the afternoon, will be able to see the flowers and plants, and note favourites to be afterwards purchased and grown in their own gardens. Olympia is an excellent place for such a show, with its glass roof admitting full daylight, and securing dryness underfoot, and having a breadth permitting broad gangways. The hall will be surrounded with a sloping bank of floral groups rising to a height of 15ft. to 20ft. In this hall table exhibits will be placed, including an avenue of orchids, while at the west end rock and water gardens will be surrounded by rose gardens. Several valuable cups are offered, including one of fifty guineas in commemoration of the Coronation of His Imperial Majesty King George V. We have the assurance that the Council are putting forth every effort to make this show an unprecedented success, and a source of gratification to Fellows and friends of the society. The exhibition is receiving the very welcome consideration of the railway companies with regard to special facilities for visitors from a distance; and so it is hoped that it will be made possible for a large number of visitors from the provinces to pay a visit.

South African Boxwood.—At the meeting of the Royal Society, held on the 19th ult., a paper was read on "The Pharmacological Action of the South African Boxwood (Gonioma Kamassi)." The wood of this species of gonioma has been employed occasionally in Lancashire as a substitute for common boxwood in the manufacture of shuttles; it is stated that symptoms of poisoning have occurred in a small proportion of the men engaged in sawing this wood or finishing the chiselled shuttles. From the wood an alkaloid can be obtained to about 0.07 per cent. This has a very characteristic physiological action, which places it in the curare group of drugs. The members of this group may be regarded as possessing three actions in common: (1) Paraylsis of certain nerve cells; (2) increase of spinal and medullary reflexes; (3) paralysis of motor nerve endings. Boxwood exerts all these effects. It paralyses the nerve cells in the brain and medulla, as well as those on the course of the vagus and sympathetic nerves, and therefore after its exhibition to animals the stimulant action of nicotine cannot be obtained. In small doses the reflexes are increased, and if an injection be made into a vein going to the spinal cord of an animal, strychnine-like convulsions are produced. Boxwood causes death by paralysing the respiration; this is central in origin, but it occurs at a time when the phrenics and intercostals are depressed, though not paralysed. It has no direct action on the heart, or on other form of muscle. Reasons were given for believing that the recorded cases of poisoning are not due to the specific action of the drug after absorption, but to its effect in facilitating certain local reflexes, principally of a respiratory nature.



GUNNERA MANICATA.

A fine specimen of this noble plant in the wild garden at Talygarn, 10ft. 6in. high, and 68ft. in circumference.

GUNNERA MANICATA.

I send you herewith a photograph of Gunnera manicata growing in a very cold position in the wild garden at Talygarn. The plants shown were treated liberally as regards food material. A deep, wide hole was made, and the inert clay removed was piled up around the edge of the hole. Several loads of farmyard manure and old potting soil were wheeled in and mounded up, and on this mound three plants of Gunnera manicata were placed in the spring of 1906. Each plant was previously in a 7in. pot. A good watering followed planting. It must be noted that the site is in the wild garden, high up above the lake.

During each winter a heavy dressing of farmyard manure is placed over the roots, and the large conical crowns are covered with some light strawy material, which is kept in position by means of long pegs. As the new growth pushes up in the springtime this covering is released to allow the new leafage to expand, and when all danger from frost is over the protecting material is removed altogether and the heavy manure is rearranged over the rooting area.

Gunnera manicata is a magnificent plant, and far superior, in my opinion, to Gunnera scabra, and quite as hardy. Its mammoth leaves often measure 9ft. across in warm districts, and are borne on thick, rough stalks. A fine specimen produces a distinctly sub-tropical effect, and yet Nicholson tells us that G. manicata is "a majestic plant from the cold and freezing regions known in Southern Brazil under the name of Campos des Lages."

The dimensions of the group represented in the photograph are: Circumference, 68ft.; height, 10ft. 6in.; largest leaf, 7ft. 9in. across. J. E. Davies.

BARE GARDENS IN WINTER.

"I, singularly moved
To love the lovely that are not beloved,
Of all the seasons most
Love Winter. . . . . .
. . . .
Nor is in field or garden anything
But, daily looked into, contains serene
The substance of things hoped for, in the Spring,
And evidence of Summer not yet seen."
—Coventry Patmore.

Most real garden lovers are, or should be, Nature lovers also, and when we look at the country in midwinter, whether it is from the train, the motor, or the more enjoyable footpath through field and wood, we do not find it a desert, but, on the contrary, still full of beauty and interest. We can see into the heart of the woods, and view the mystery and the beauty which the summer foliage concealed—the carpet of rich brown leaves, the varied forms and colours of the tree trunks, and the bracken, still stately, and showing its graceful outlines even more than in the summer—while the banks and waste places are covered with the dry growth of the past season's vegetation, and the hedges are red with berries, and show up the rich and varied colours of the dogwood, spindle-tree, hazel, etc., with festoons of travellers' joy, honeysuckle, and nightshade over all.

But in our gardens, in the less favoured parts of the country, which perhaps constitute seven-eighths of it, what do we see? Every leaf and stick cleared away, roses, clematis, and honeysuckle, if not cut back, at least tied in neatly, with beds and borders presenting a sodden mass, not unlike huge mud piles—a generally depressing sight, of which we may see the most hideous examples in some of the most expensively kept public gardens in London, and our great cities generally. It is not the large private gardens so much as the small ones that one has in mind, the former having availed themselves more fully in recent years of the wealth of exotic shrubs, with their beauty of stem, leaf, and berry, and the gardeners are only too glad to get good breadths of ground so occupied.

But with regard to the small gardens, up to half an acre, let us say, the first and most obvious remedy is the planting of trees and shrubs, berried or otherwise, which are specially attractive, some way or other, during the winter, such as the snowberry, Cratægus Lelandi, barberries of sorts, cotoneasters, hollies, wild and other roses (sempervirens, lucida, etc.), cardinal willow, and shrubby veronicas, to mention only a few of the most popularly known. Even winter-flowering shrubs may be planted, as the witch hazels, winter sweet (on a sheltered wall), Garrya elliptica (where hardy), laurustinus, yellow jasmine, and, very early in the year indeed, Daphne mezereum and Cydonia japonica. Nothing looks better than the yellow jasmine throwing out its thin flower-covered stems from a tree stump, arch, or wall, covered with some of the small-leaved ivies.

There is always the problem of space to be considered, and the objection to sacrificing summer effect for winter, which latter we may minimise in two ways, partly by growing small shrubs only—either small-growing kinds, or larger sorts kept small by judicious pruning, and eventual replacing, and partly by using larger ones as supports for climbers in the summer, such as clematis, rambling roses, eccremocarpus, Tropæolum speciosum (where it succeeds), T. canariensis, and other annual creepers. Forsythia suspensa looks even finer in the spring than Jasminum nudiflorum in the winter, when grown in conjunction with ivy. Cherry, aucuba, and Portugal laurels are not recommended unless space is plentiful, and only then if they can be given their freedom of growth, though it must be admitted that small, freely-grown specimens have a fresh appearance in a moderately open winter.

Then there is the planting of evergreen plants to relieve the bareness of the ground. They are legion, and we have only to begin with iris, rose of Sharon, hart's-tongues and polypody ferns, wallflowers, Jacob's ladder, candytuft, saxifrages, and shrubby subjects like rosemary and lavender, to realise the range of selection. Summer beds, too, whether planted with bulbs or not, should be carpeted with green plants, such as violas, primulas, double arabis, alyssum, myosotis, silene, Limnanthes Douglasi, etc., if only for the winter effect. There are flowering plants, too, for this season, more than is generally recognised, and we might mention Algerian iris (in a dry place in front of a sunny wall), snowdrops, and winter aconite (a pretty combination), Christmas and Lenten roses, winter-flowering wallflowers, winter heliotrope, with hepaticas and primroses very early.

And, lastly, there is one way in which we can relieve the winter desolation of even the smallest garden, and that without expense or sacrifice of summer effect, namely, by leaving the stems of some of the summer plants well into the winter. Judgment must be exercised in this matter or the latter state will be worse than the first; some plants, if left untouched through the winter, only intensifying the dreary aspect of the garden. For instance, a bed of tall phloxes look simply ragged after November is out—they may be left till then—the leaves turning black and the stems a dirty white; but a well-grown clump of Gypsophila paniculata looks scarcely less effective at a little distance than it does in the summer, while a good break of Michaelmas daisies looks like a miniature copse, the stems taking on a nice brown colour, and retaining some of their leaves a good way into the winter. With some subjects the seed pods (as honesty, love-in-a-mist, linums, and poppies) and dead flowers (as Michaelmas daisies and annual chrysanthemums), make it worth while to defer tidying up for the winter. All grasses, too, are specially good. Those who have not tried it will be surprised at the variety of browns, yellows, and greys which may be obtained, and with many herbaceous plants with woody stems there is no need to cut them till the new growths begin to appear in March. On the other hand, nothing looks more deplorable than geraniums, balsams, and bedding plants generally, left out of doors for the winter.

One or two remarks of a general character must close these notes. We should try to make the garden, not only less desolate to look at from the house, but more pleasant to saunter in when the weather is fairly genial during the winter. We too often become strangers to our gardens for four or five months, and thereby lose a good deal of their interest, for if well managed they always have something to show to the sympathetic observer, and their attractiveness during the summer is by no means lessened by an acquaintance with them during the time when mere townsmen think them no more interesting than a bare ploughed field. And it is not with the eye of sense only that we may look. Listen to Coventry Patmore again:

"It is not death, but plenitude of peace;
And the dim cloud that does the world enfold
Hath less the characters of dark and cold
Than warmth and light asleep.
And correspondent breathing seems to keep
With the infant harvest, breathing soft below
Its eider coverlet of snow."

One thing necessary to the enjoyment of the garden, or that part of it which is more especially intended for winter use, is a good dry path, preferably with stone paving down the centre, making a stroll in the garden pleasant when otherwise it would be scarcely worth attempting. Another feature which, if not a necessity, is at least a desideratum, is a good natural shelter from the north and east winds, either in the form of trees, groups of evergreen shrubs, or a hedge of yew or holly. Not only does such a shelter, combined with a good surface for the feet, make a retreat where one may linger outdoors, or even sit, at times, in every month of the year but winter flowers may be so encouraged, and early spring flowers so much accelerated, that the gap between the seasons will be very much lessened, so that, before we have quite lost sight of the last chrysanthemums in the open, winter aconites and snowdrops will be already appearing. The use of such a corner will not be confined to the winter months, for recent years have shown, or reminded, us that we need not be above seeking the warmest part of the garden even in July and August.

Alger Petts.

APPLE LANE'S PRINCE ALBERT.

I was glad to see that Mr. Molyneux strongly recommended this apple. In his recommendation he rightly pointed out the few faults, or drawbacks, that this variety possesses, as any inexperienced cultivator might be induced to do away with young trees because of their stunted growth. I agree with your esteemed correspondent when he says the small grower should always include this variety; and I would add, so should the large grower and that on a large scale. When I first planted young trees I was pleased to see them fruiting so early and so heavily, and then was alarmed a little at their stunted growth; but it was my own fault for allowing so many fruits to mature on them. It was similar to the working of a young horse before he had gained sufficient strength to withstand the strain. The overcropped young tree required several years' careful treatment before it had regained its normal condition. When I again planted young trees of this variety, care was taken that they were cropped very lightly at first, and a decided gain was the result. I fed the trees with copious supplies of liquid manure, and so induced a freer growth, but even then very little pruning was necessary. A top-dressing of soot and a little sulphate of iron, put on in March, intensified the colour of the fruits.

Geo. Garner.

Araucaria excelsa from Cuttings.—That young plants of Araucaria excelsa form very pretty subjects for the greenhouse, while they also do well when treated as room plants, is a fact now generally recognised. Owing to the demand for small plants great numbers of seedlings are sent to this country, and are disposed of at a comparatively cheap rate. These seedlings, even if potted deeply, are always more or less bare at the base, and cannot, for decorative purposes in a small state, be compared with those raised from cuttings. For this purpose, the side shoots, even though they will strike, are useless, as they never form symmetrical plants. Suitable cuttings are obtained by cutting back old plants which will then push up two or three leaders from the top, and it is these leaders, when large enough, which form the best of cuttings.—W. T.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

SOLD IN BAGS AND TINS BY SEEDSMEN, NURSERYMEN, ETC.

Manufactured — by — **THE CHEMICAL UNION, LTD, IPSWICH.**

NEW GARDEN PEA FOR 1911.

MASSEY'S RELIANCE, per packet 1s. post free.

Mr. W. A. Cook, Head Gardener to Sir E. G. Loder, Bart., writes: "I am very pleased to inform you it proved a great success, especially as it was such a cold wet time for early peas. Sown on the same day as several other varieties, it was not one day behind, and is equal in bulk to anything I have ever grown. Haulm about three feet, with especially long pods for so early a Pea."

GEO. MASSEY & SONS, Seedsmen, SPALDING.

EARLY FLOWERING SAXIFRAGAS.

Of early flowering rock-plants none are more generous in their floral harvest than the diminutive saxifragas that bloom in the opening months of the year. Their unquestioned hardiness, freedom of growth, and precocity are forcible arguments that readily appeal to cultivators, while their extreme type of beauty wins for them a place in public favour. They belong to a group that embraces the most select members of this genus, and the Kabschia group of saxifragas will ever claim the attention of those who appreciate beauty in hardy plants. In the early-flowering section the general character of the plants is to form spreading carpets of dense spring growth, differing to some considerable extent in colour, but always evergreen, and even when out of flower each species or variety forms a welcome addition to the rock garden, by reason of the manner in which it clothes the ground.

SAXIFRAGA BURSERIANA.
Dwarf in growth and early in flowering; the blossoms pure white.

In order to realise the great beauty of these early rockfoils it is advisable to plant several together, so that eventually they will meet and form a continuous mass. With kinds like S. Sancta and S. apiculata growth is comparatively fast, and this end is soon secured, but with S. Burseriana and its forms, some years must elapse before this ideal can be attained; its consummation is, however, worthy of strenuous effort on the part of every ardent cultivator. The cultural requirements of the Kabschia saxifragas are not difficult to comply with, so far as soil is concerned, as they succeed in any rich, cool loam, preferably in that containing a good deal of lime, as, with few exceptions, they are limestone plants, and provided the soil is of this quality, they stand abundance of sun, but it is imperative that it should not dry out in summer, and of equal importance is the absence of anything approaching stagnation in winter.

When planting the Kabschia rockfoils it is well to recognise that they succeed best if firmly planted in soil containing an abundance of stone chips with which they can be tightly wedged. In subsequent years the vigour of the plants is readily maintained by top-dressing with finely-sifted soil worked into the masses in autumn, or in spring after the flowers fade.

The most famous of the early saxifragas is S. Burseriana, a species native of Eastern Europe, and introduced to gardens about the year 1826. It is a variable species, though always within well-defined limits. The type forms a low, rounded cushion of tightly-packed stems, only an inch high; the leaves are needle-like, grey-green in colour, and surround the stems after the manner of juniper growths, to which they have a striking resemblance. The flower-buds appear in January and begin to elongate towards the end of the month, being in flower during February, early or late, according to season or locality. The buds are a charming shade of red, a colour that is also present in the stems, and adds to the effect of the group when the big white flowers are unfolded. The form named Major is larger in its parts than the type, and a few days earlier to flower; in the variety Gloria the pure white petals are waved in a very dainty manner.

Saxifraga apiculata is one of the commonest of this section, and also one of the most effective of garden plants, producing lemon-yellow flowers on three-inch stems in clustered heads. The foliage is a rich shade of deep bronze-green, a shade or two lighter in colour than S. Sancta. The last-named species with S. juniperiana is not so conspicuous in flower as the former, giving darker shades of yellow; both are healthy growers, and soon form dense mats of leafage.

Saxifraga Boydi is a variety of garden origin and comparatively rare owing to its slow growth; the flowers are lemon-yellow, on short stems that rise from close-set mounds of spiny leaves. S. Boydi alba is a stronger form that increases freely, and has pure white flowers.

Saxifraga Elizabethæ has the characteristic grey-green needle-like leaves of this group, and its flowers are a rich shade of yellow; it grows freely, and soon makes a good clump. S. Salomoni is a garden form with white flowers, resembling S. Burseriana, but taller and generally with twin flowers to a stem, whereas the latter invariably produces one flower on each stem.

The Kabschia saxifragas that grow in spiny tufts all flower early in spring, generally from the end of January until the beginning of April.

Thomas Smith.

Begonia polyantha.—This Mexican begonia is not much grown, yet it is very useful for flowering during the winter months. It has a free, bushy habit of growth, being plentifully furnished with neat green leaves, and it keeps up a succession of deep pink flowers for a long time. It is true the blossoms are less showy than those of some of the other winter-flowering kinds, but they are bright and cheerful, and the continuous display is greatly in favour of this begonia as a decorative plant. Added to this, it is of very easy culture. —W. T.

PESSIMISM AND BIG BUD.

A Rejoinder.

I have only just seen Messrs. Pearson's letter concerning my remarks on "big bud," otherwise I should have dealt with it before.

In the first place, I would respectfully suggest that the writers of that letter have never seen "big bud" at its worst, as fruit growers see it, particularly here in Kent and Essex, otherwise they would not talk so glibly about it being dealt with "as easily as aphis." It is one thing to deal with a few isolated buds on trees in nursery quarters, where the question of damage to fruit does not arise, and quite another to cope with it on big trees, where hundreds of buds are affected. At the same time, if I am "out of date," at least I am "behind" in good company, since Professor Theobald, of Wye College, one of the greatest scientists in this country, in his book, "Insect Pests of Fruit," published not six years ago, but in 1909, says, p. 244: "Nothing further need be said on this subject; all other methods, such as fumigation, spraying, and greasing the bushes (a thoroughly unpractical method) are of little or no value. The grower must rely on hand picking, the growing of strong varieties, grubbing, and replanting with clean stock when the plantation is so badly infested that it becomes unproductive." Perhaps I may suggest that Messrs. Pearson send Professor Theobald one of their catalogues containing the information which they quote.

May I briefly review the history of the attack, so far as we personally are concerned:

Some fifteen years ago now we had our first sight of it in our own plantations. One tree amongst some Carter's Champion, bought in from a nursery, showing it so plainly that we recognised it. I personally cut down this tree to the ground most carefully, and immediately carried the boughs out to the headland and burnt them.

This did not avail however, for the next year others around the first were affected, till the attack spread to the whole plantation. We were told at that time that nothing could be done for it save hand picking the first affected buds until the disease became too bad, necessitating our pulling the bushes out. Various varieties were declared to be immune, but after a year or two most of them succumbed, and hope did not seem possible in that direction.

Then the cyaniding process of fumigation came to the front, and was emphatically declared as a remedy for big bud, but after a few months was equally emphatically pronounced a failure. So again we were disappointed, though we doubted the possibility of employing cyanide commercially owing to the great cost of material and labour. We read all the literature we could lay our hands on concerning the disease, but to no purpose.

I remember attending a lecture in the old Drill Hall, at Westminster, on "Insect Blights and Blessings," which, I recollect, did not strike me as being very practical at the time, though now, as I read it, I realise its value. Mr. Enoch spoke then of a parasite of the already minute gall mite (1-400 of an inch long the latter is), which might perhaps be bred in sufficient numbers in captivity to become a help in dealing with the attack. The present Director of the Wisley Laboratory was then at the Essex County Council Laboratory, at Chelmsford, and, I fear, was much worried by us to find us a practical cure for "big bud." At length he told us he had heard that dipping the trees in a solution of sulphur and soft soap had been spoken of as efficacious. We made this bath by thoroughly kneading soft soap and sulphur into lumps about the size of a cricket ball, and then dissolving them by boiling in a copper. Into this mixture we dipped the young trees from the nursery beds when we were planting out, roots and all. At first it seemed to work well, but later on the big bud appeared, though whether from original attack or after infection I cannot say.

Some five years ago, in the middle of the summer, there appeared, with a great flourish of trumpets, in a trade paper, this wonderful remedy which Messrs. Pearson quote, viz., lime and sulphur. I recollect that it was too late for use that year, but most fruit growers made a mental resolve to try it the next year. We ourselves tried it, making our own preparation, and slaking our lime, and though we did no damage, we could see but little good result. Throughout that season conflicting reports came in from growers, some ascribing to the system all the virtues, and some speaking of nothing but failure.

The following year we purchased the preparation ready-made from a chemical firm of good repute, and applied it at the suggested time, but, unfortunately, absolutely burnt the crop up, all the berries falling off as if frosted. The following year we again mixed the materials ourselves, again slaking the lime, and with nearly as direful results, as far as the crop was concerned, so that we decided it was preferable to have a few currants and big bud rather than no currants at all.

This happened with slaked lime, so what the effect of the burning is with caustic lime applied when the bushes are moist, to make it adhere, I can but dimly imagine.

Herein, it seems to me, lies the point which I alluded to above; in a nursery no question of burned blossoms arises, and if there is a scorched leaf or two it does not matter, but with a fruit grower, whose business it is to get fruit, the case becomes much more serious. Professor Theobald says, with regard to this (p. 243 : "The writer has never found the least benefit, but two large growers, who can be relied upon, have found it beneficial. On the other hand, we must note the record of hundreds of others who have found little or no use in this treatment." And again (p. 244): "Considerable damage is often done by this treatment, owing to the scorching of the leaves and shanking off of the fruit." So it will be seen we are not alone in our disastrous experience with Professor Collinge's remedy.

I chanced to find in one of the journals a record of Mr. Massee's experiments with big bud when the Wisley Laboratory was first opened, and the success he found he got by greasing the bushes. Following this line of thought, I wondered if some greasy fluid could not be put on with a spraying machine just before the buds burst. I suggested it to a firm of chemical manufacturers, who made numerous chemical investigations, and at length produced a sticky fluid which could be pumped, and which remained tacky for a considerable time, but at present no definite results have been obtained. It seems to me that if there is anything in quassia and soft soap spray it must work somewhat on these lines. Anyone who has microscopically examined "big bud," and seen its teeming population, and watched with what rapidity and agility the mites can move, and, furthermore, understands the manner in which they work, cannot credit that four sprayings in two months (at least) can possibly rid the bushes of the pests.

Consider the period; one spraying at the end of March, two in April, and one at the beginning of May, covering a time in which the bushes are growing very fast, and new buds are being formed in the axils of the leaves. The old affected buds are losing their population gradually, so that there are always mites ready to take up their quarters beneath the scales of the forming bud, and once there they are safe from spray, fumigation, or anything almost that man can do.

I am not going to argue that quassia and soft soap as a contact wash will not kill the mites which are out on the surface of twig or leaf; I believe it will, but I am equally sure that at least once a week the bushes must be sprayed if badly infested, to cope with the pest, and I am not at all easy in my own mind concerning the effect of such spraying upon the opened blossoms.

I hope I have said enough to prove that we have done all in our power to cope with this insect attack, and that, if we are "out of date," it is not for lack of trying to find out the latest remedy, or trying it when found. I have still faith in the greasing method, and I want to see it further worked out in our experimental stations, for I fancy that somehow along those lines the solution of the problem will come.

Fred W. Hammond.

THE NATIONAL SWEET PEA SOCIETY.

Through the columns of the Gardeners' Magazine, which has at all times given much encouragement to this society, I should like to say that, in my opinion, the time has come when the society should have its rules thoroughly revised. Since its inception I have been a member of the society, and for a long period was a member of committee. Consequently I have taken an interest in its work, and should much regret to see it declining in popularity. I would like to offer a few suggestions for the future management. The constitution of the Floral Committee seems to have caused all the recent trouble. From the rules of the society, which, by the way, are arranged at the wrong end of the schedule, I cannot gather that there has been any power to appoint a Floral Committee at all. The practice in the past has been for the General Committee to nominate a Floral Committee from its own members. In my opinion this body should be appointed by ballot at the annual general meeting in the same way as the General Committee. The Floral Committee, instead of consisting of eighteen members, should be nine at the most; seven would be better. This body should elect their own chairman for the year. Instead of stipulating for an equal number of amateurs and traders or their managers, the Floral Committee should be elected simply for their fitness for the office, no matter what their occupation. Apparently a notion has got abroad that by having an equal number of each section one could control the other should either display any partiality during the examination of novelties on trial. All I can say on this point is, that if eight members cannot control the one in his attempted partiality, then they are a weak lot, and not fit for the office they hold.

As to the method adopted in the trials of new varieties, I do not agree with the plan of growing them under number, on the plea that the adjudicators shall not know whose varieties they are examining. If this is the case, then the management do not attach much importance to the integrity of those who adjudicate. Far better would it be for all concerned to label every variety, this label bearing not only the name of the variety, but also the name of the sender, so that the public could see whose varieties were superior in every respect. Such a plan would check the sending of doubtful varieties or stocks, and those who do send the best would obtain due credit. Far better would it be to open out any doubtful channel by giving publicity to all points, and allow the public to judge for themselves, and act accordingly. If such a plan were adopted, we should quickly see a reduction in names, which is an absolute necessity to place the sweet pea on an even higher pinnacle than it now so deservedly commands.

As to the definition of an amateur, which term I gathered at the meeting last week was likely to be adopted as framed by the R.H.S., no one who seriously studies the question at all can accept such a definition as that set forth by the Royal Horticultural Society, and in my opinion is less applicable to the National Sweet Pea Society than to its own Fellows.

E. Molyneux.

HOW TO GROW SWEET PEAS.—"Sweet Peas and their Cultivation," by C. H. Curtis (Secretary of the National Sweet Pea Society), is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 3d., or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

AMONG THE ALPINE FLOWERS.

"Silver and gold! The Snowdrop white,
And yellow-blossomed Aconite,
Waking from Winter's slumber cold,
Their hoarded treasures now unfold,
And scatter them from left to right.
Ah, with how much more rare delight
Upon my sense their colours smite
Than if my fingers were to hold
Silver and gold."

Flowers now wake from their winter's trance, and all around are tokens of the dawning of their beauties. Foul weather in plenty we yet shall have, snow and frost, winds and rains, sleet, and the manifold trials of our northern springs. Yet we may enjoy in the present the blossoms we are privileged to own, and for the moment endeavour to drive from our minds the fears of coming disasters to our plants which long experience has warned us to expect ere summer comes with its glorious sunshine, its generous airs and its bounty of blossom. It is for us now to cull from our gardens a little posy of hardy flowers, so that the reader may remember that the open garden may yet bestow upon him some bounty, less lavish, perhaps, than that of the garden under glass, but none the less fascinating or enjoyable, though it may be plucked among rain-showers and in a temperature of ungenial cold. First, as is proper, we come to the

Snowdrops.

Emblems of purity and grace, these chaste flowers grow dearer and dearer to us as the years pass on. Their graces are perfect, and their charms, coming at a time when others of Flora's daughters are at rest, delight us even more than they would if they came to us later in the year. We gaze upon them with unalloyed satisfaction wherever they may grow. Yet the rock garden presents them in a higher degree of beauty than even the grass, and little clumps or great sheets piercing through other plants and drooping their silver bells above them are exquisite there. Probably we have no finer snowdrop in its own modest growth than Galanthus nivalis, the common snowdrop, but we have others of more opulent grace, and these may well be added to the choice rock garden. Here, for example, we have

Galanthus Atkinsi.

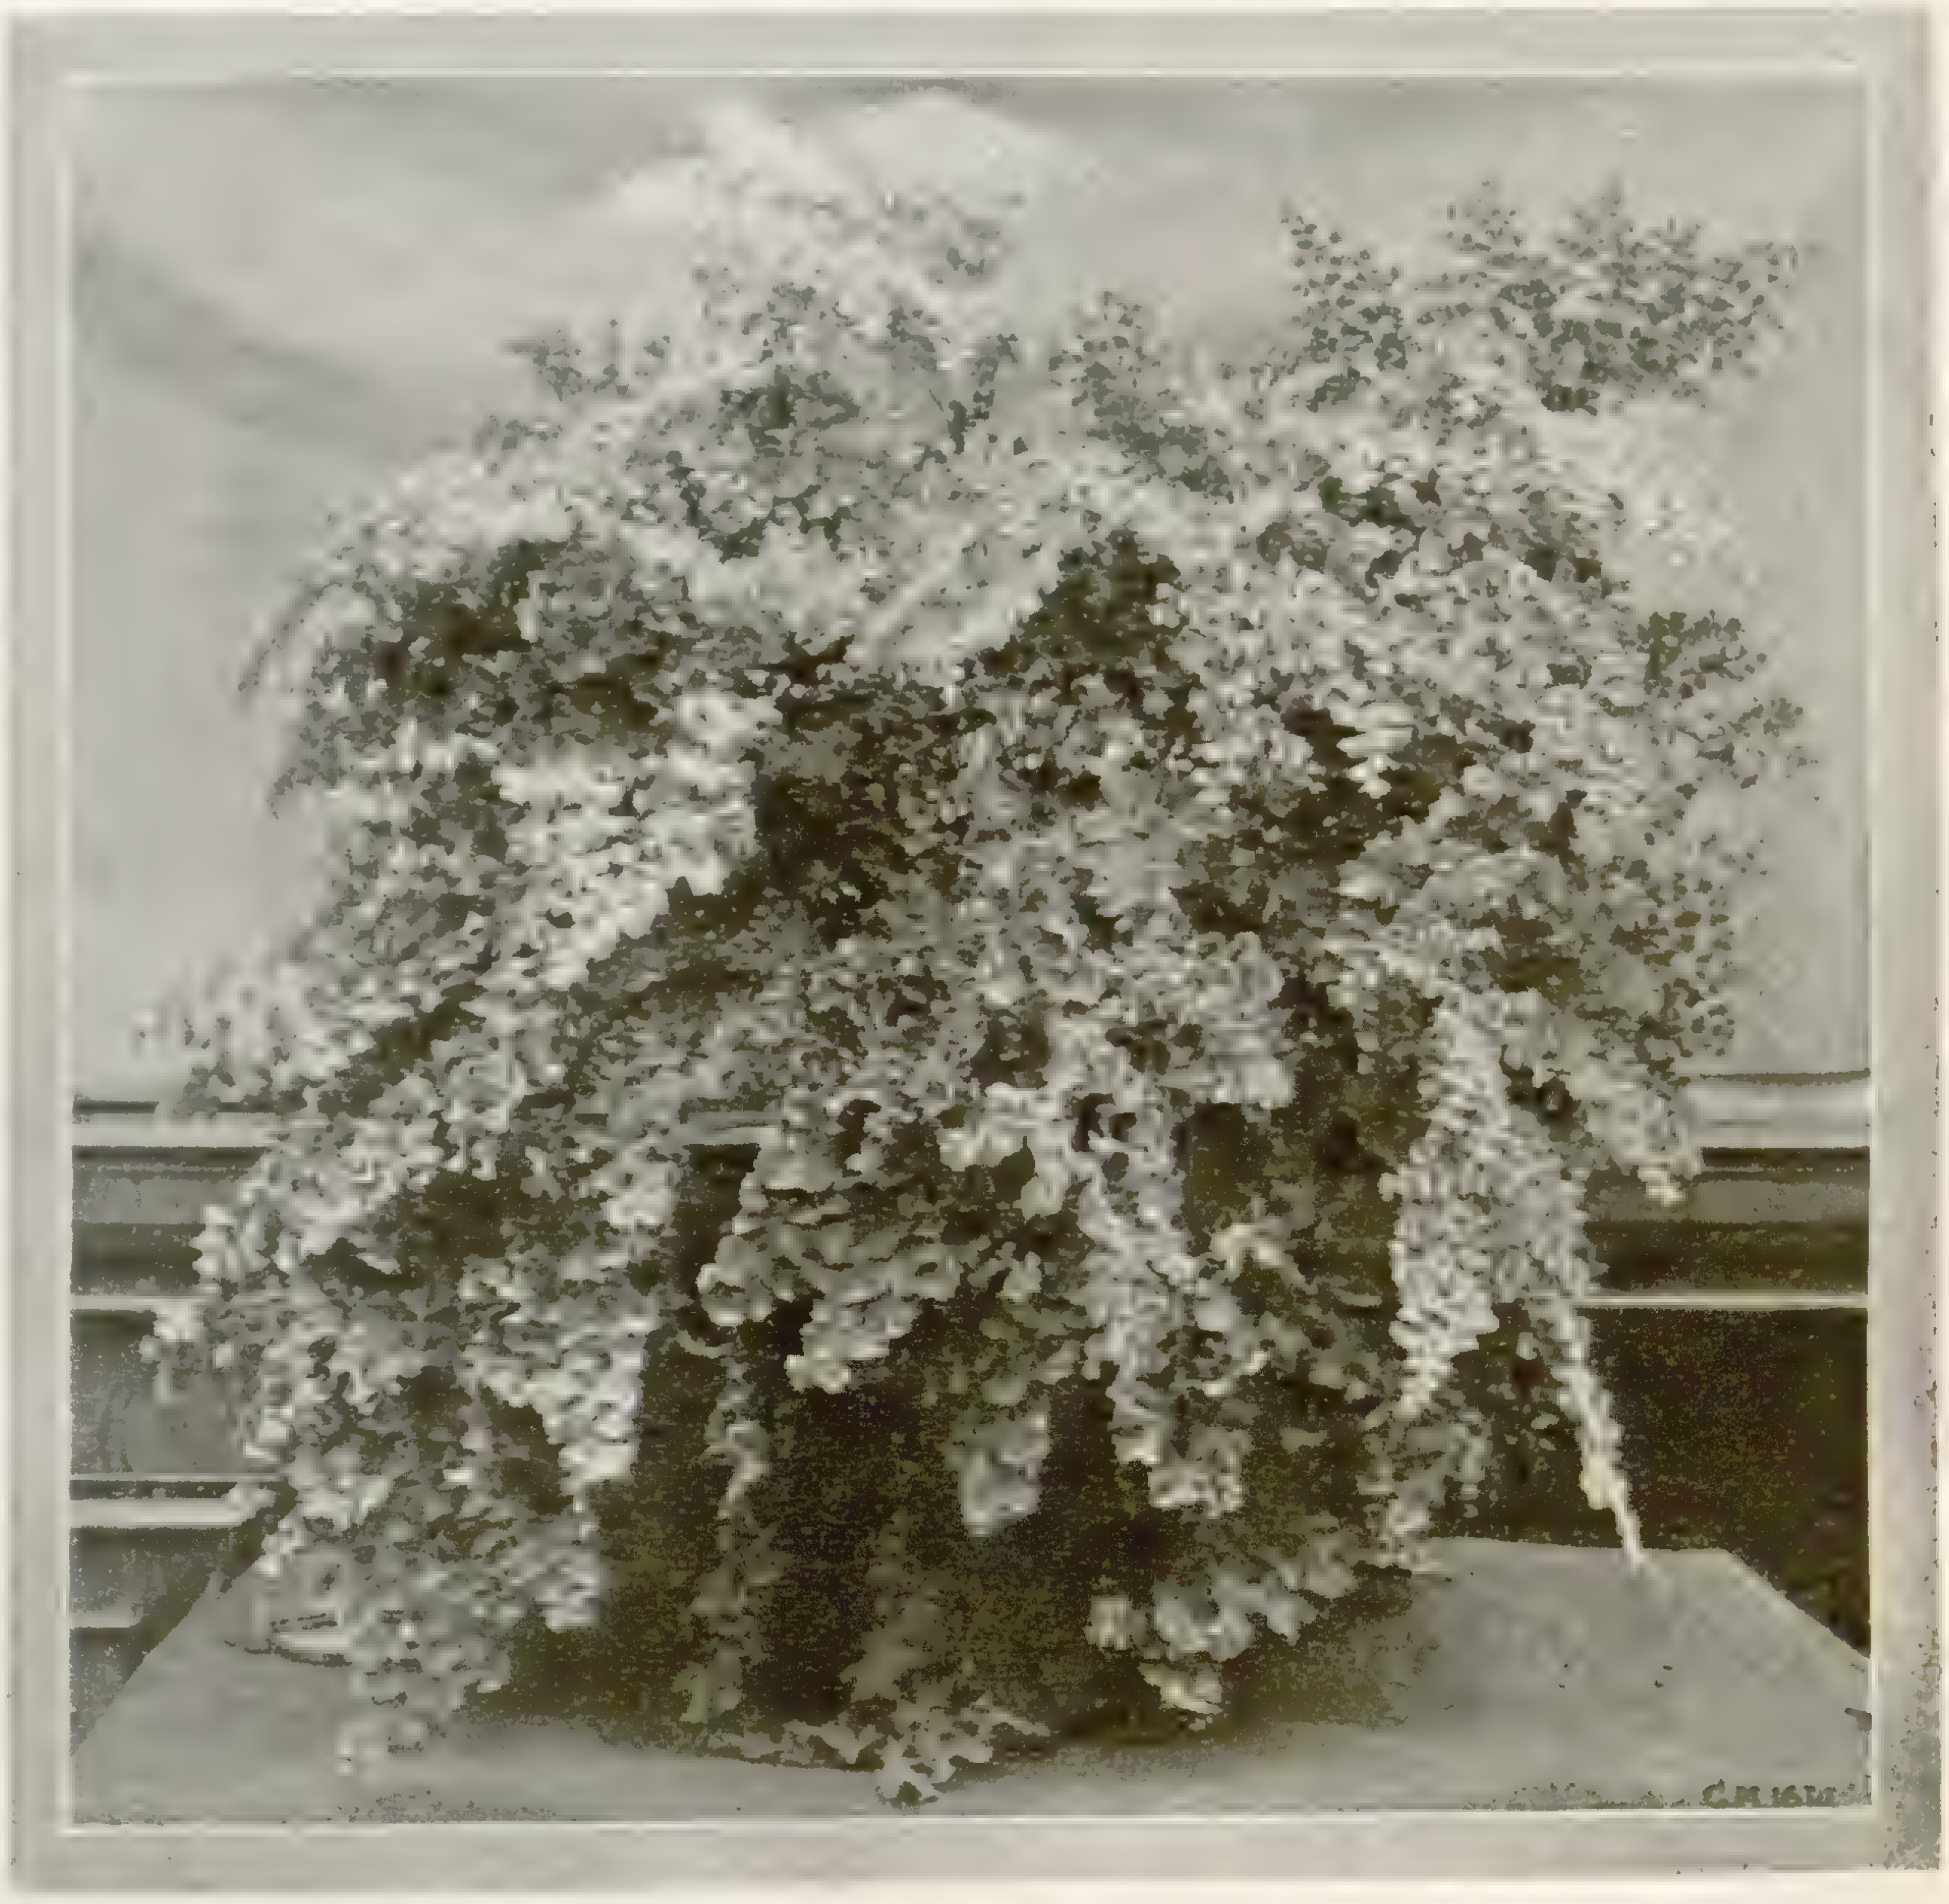
This is a noble form of the Italian G. Imperati, itself only the southern type of our common G. nivalis, but vastly glorified. It is like some tall, willowy maiden of the highest beauty, who stands pre-eminent among her sisters, and whose graces are so manifest that we cannot but admire them. This lovely snowdrop has tall stems, large, well-formed flowers, which are of purest white, save for the green ornamentation which led Robert Buchanan to write the lines:

"Could you understand
One who was wild as if he had found a mine
Of golden guineas, when he noticed first,
The soft green streaks in a snowdrop's inner
leaves?"

A charming flower is this, Atkins' snowdrop, and one, also, which reminds one of the name of a long-departed lover of plants, Mr. Atkins, of Painswick, who enriched our gardens with many good flowers, others of which bear his name, and keep his memory green. Other snowdrops there are in plenty now, but of these the claims of space deny us to tell for the nonce.

The Water-loving Meadow Saffron.

As we pass along, glancing here and there for the opening of some of our favourite flowers, we come upon a few cones of bright rose-purple. These are the flowers of the Water-loving Meadow Saffron, Colchicum hydrophilum, which is one of the few really satisfactory spring meadow saffrons. It reminds one in its colour of the spring Bulbocodium vernum, but it is of better shape, and it seems proof against slugs, the bane of the bulbocodium, which they generally crop remorselessly. It is also earlier, and it is no slight boon, but a generous largesse of nature to give us this meadow saffron as a companion to the silver of the snowdrop and the gold of the winter aconite. As its name would imply, this Colchicum hydrophilum is a lover of moisture, and here I grow it in a little place devoted mainly to moisture-loving primulas, such as P. rosea, P. involucrata, and P. capitellata. A little plant it is, growing some three or four inches high, and giving its leaves when the flowers have passed away.



ADIANTUM FARLEYENSE VAR. GLOIRE VAN MOORDRECHT.
A distinct fertile variety. A.M., R.H.S., January 31. Mr. A. A. Fabius.

Anemone angulosa major.

Lovely, also, is the blue of the great hepatica, Anemone or Hepatica angulosa major, the earliest of the "noble liverworts" to bloom, and also one of the easiest to grow. It is long years ago since in my mother's garden I first knew and loved this flower, with its smaller sisters, the varieties of Hepatica triloba, but never yet have I seen reason to lose my affection for this plant, with its large blue flowers, perhaps not so numerous as one would like, but inexpressibly precious in the dawning of the year. Like others of its race, it grows into generous clumps with me in a shaded part of the rock garden, where a little ravine runs downwards and supplies at the base of the rockwork, but almost on the level ground among loam and leaf-soil, a happy home for these old-fashioned flowers, the hepaticas. This Anemone angulosa major is the first to flower, and very early in January gave us its first open blooms, of a delightful tone of blue. Transylvania is its native place, but it is one of the "aliens" we gardeners welcome to our shores, convinced that they, at least, will not corrupt, but will lend graces to our British gardens.

Other Flowers.

Our tale of alpine and rock flowers in bloom now is not a lengthy or an imposing one. There are lovely little mounds of such heaths as Erica carnea and its variety alba; with E. mediterranea hybrida, or, as some would prefer, simply E. hybrida. There are many blossoms on primroses and polyanthuses, a few snowflakes attempt, with no slight success, to vie with Atkins' snowdrop and its sister flowers.

There are violas, a sweet violet or two, hellebores—both Christmas and Lenten roses; golden aconites, Adonis amurensis, sheltering happily under the bare branches of a dogwood; stray blooms of myosotises, with a few plants of Cyclamen Coum and C. ibericum, looking like little gems amid the other flowers of the time.

S. Arnott.

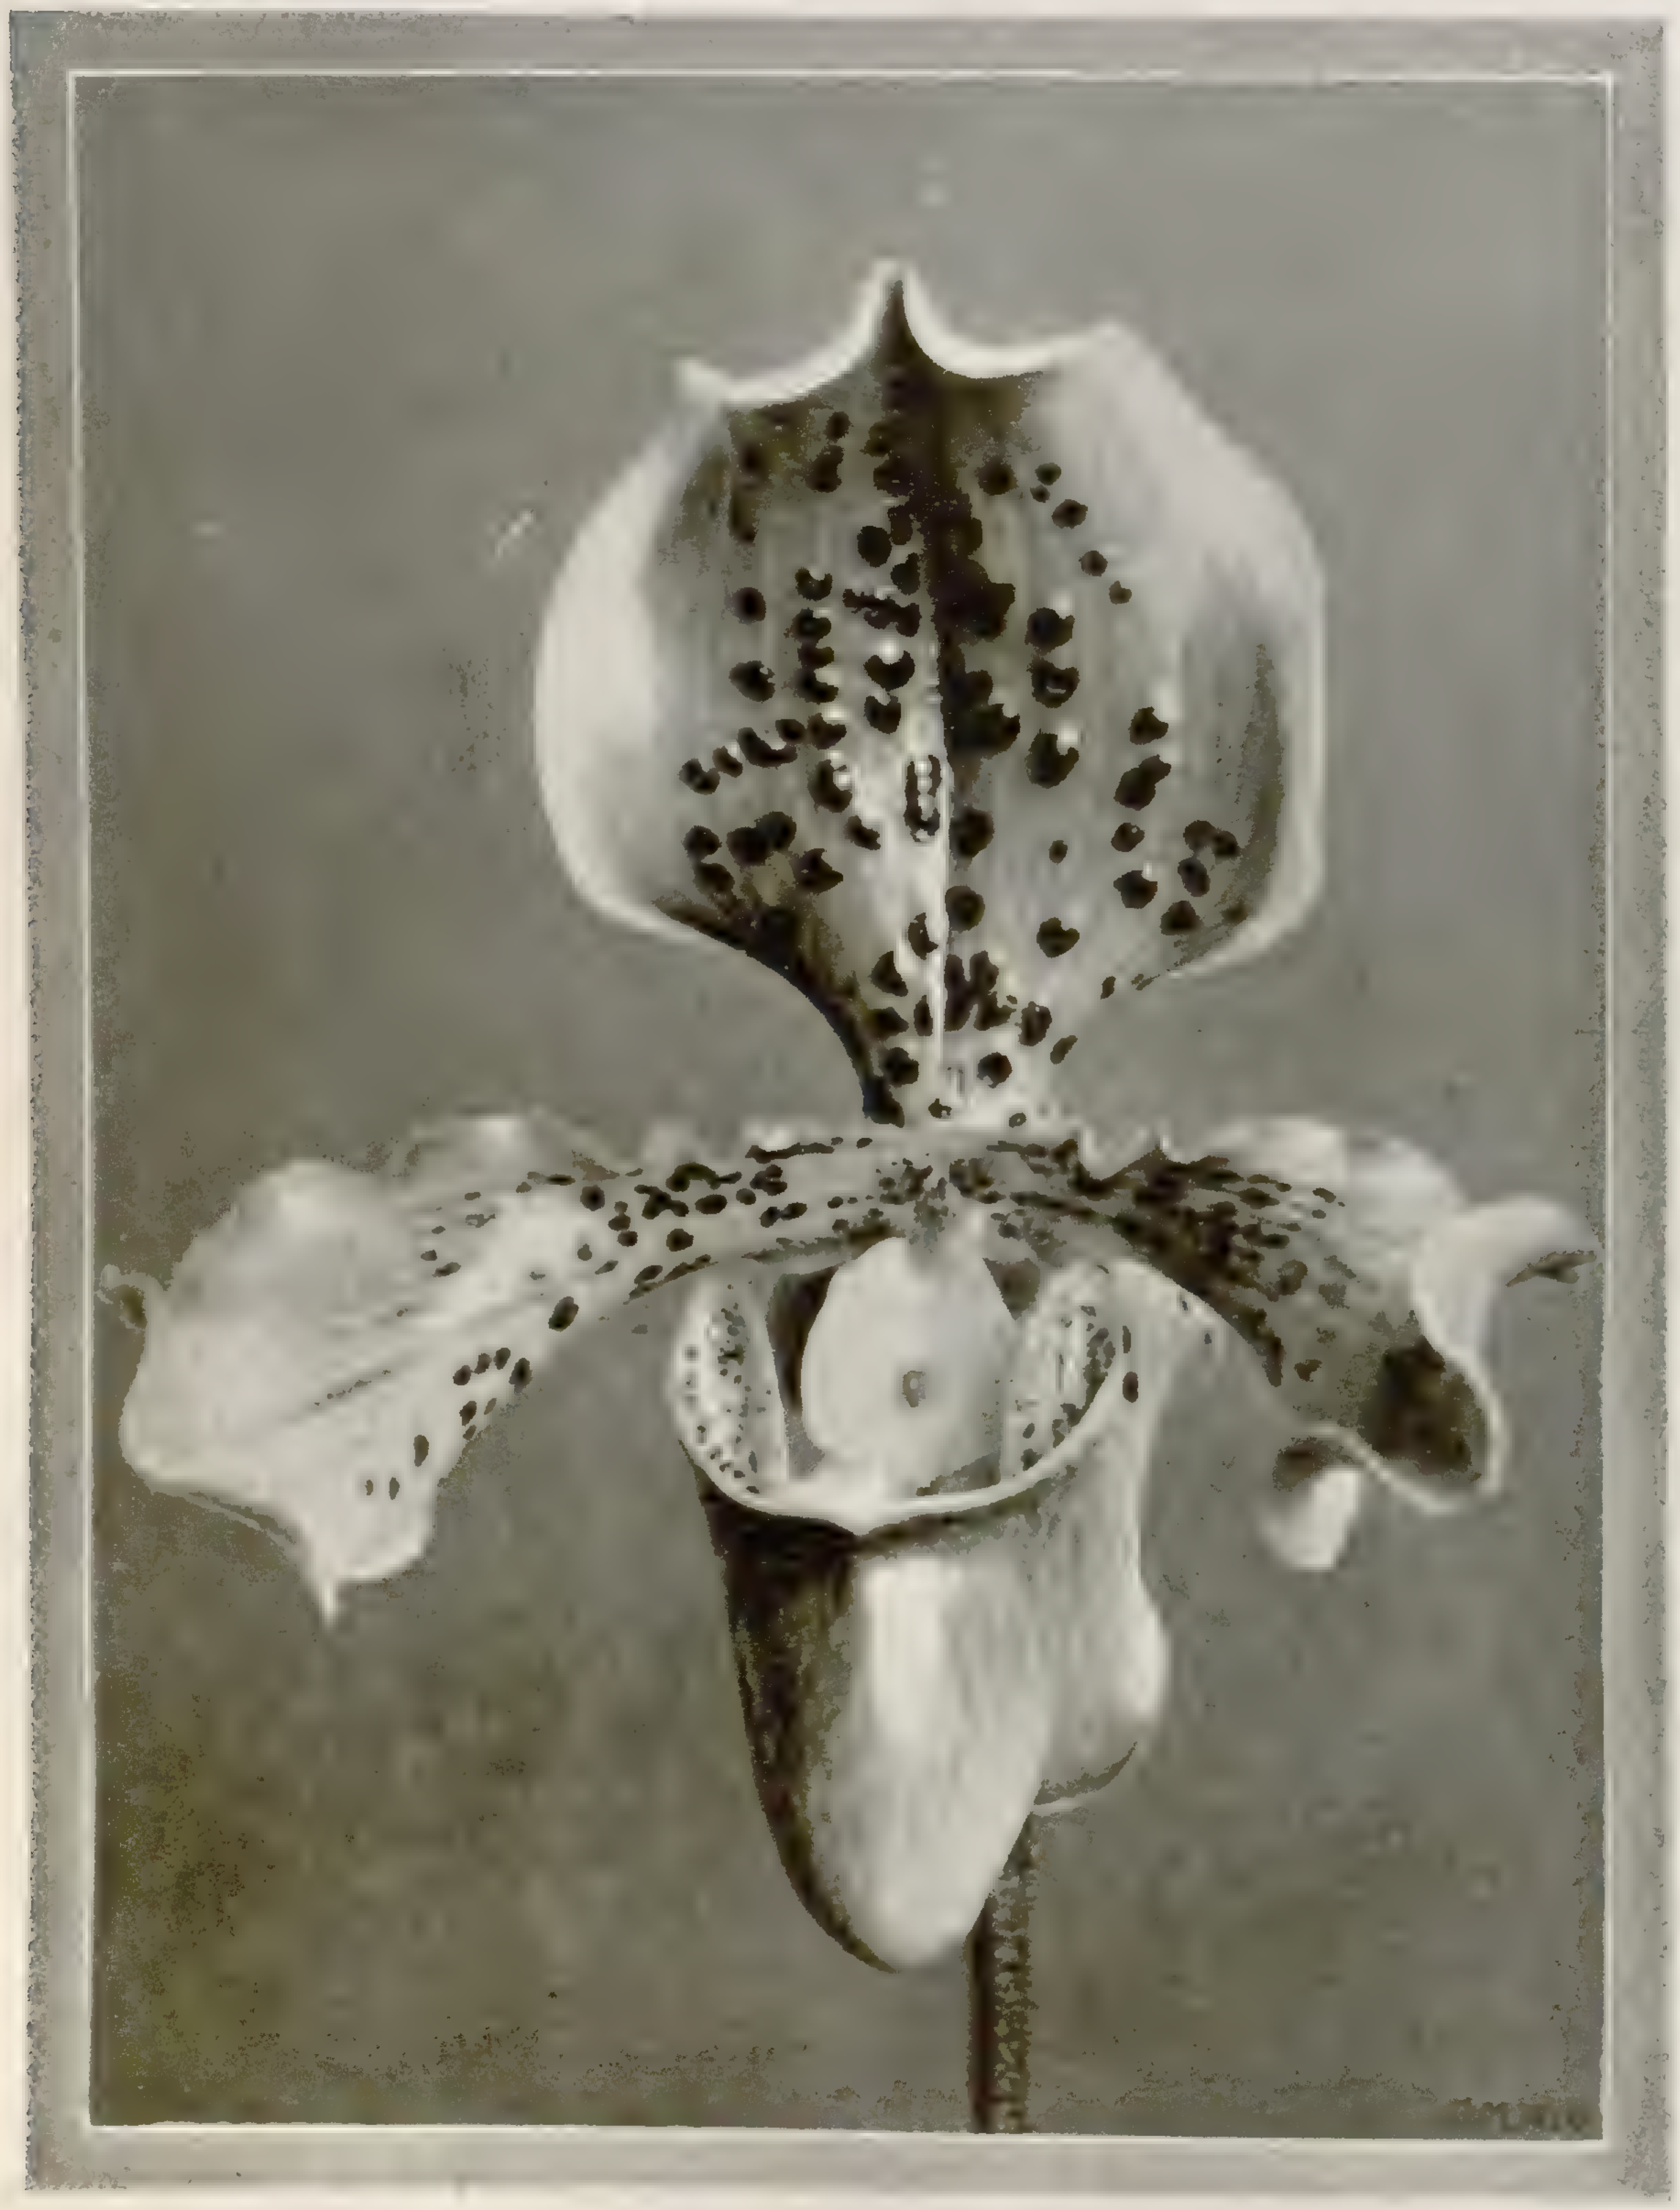
Primula Kewensis. — This is a valuable winter-flowering primula, and one that can be had in bloom by Christmas. It is as is now fairly well known, the result of an accidental cross between the little Himalayan Primula floribunba and the Abyssinian Primula verticillata. For decorative purposes it is superior to either of its parents, and where a greenhouse has to be kept gay with flowers throughout the winter it is of considerable value. It is of easy culture, and established specimens will continue to bloom for a considerable time. At first this primula was increased by division, but now seed is often obtained, and from this young plants can be readily raised.—W. T.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM HARWOODI.

A new, striking, and beautiful hybrid, which, like several others that have recently appeared, point to immense possibilities from secondary crosses. The parents of O. Harwoodi are O. Wiganianum and O. maculatum auriferum. The flowers are of good size, flattish, and the ground colour is bright orange-yellow; on this colouring are numerous dark rich purple spots, while down the centre of the lip is a straight thick mark or band of this dark contrasting colour. A splendid addition. F.C.C., R.H.S., January 31. Messrs. Charlesworth and Co., Haywards Heath.



CYPRIPEDIUM DUKE OF CONNAUGHT.
Flowers vivid green, the dorsal sepal spotted with black purple, and the petals and lip shaded brown. A.M., R.H.S., January 31. Messrs. Armstrong and Brown.

ODONTOGLOSSUM CRISPUM PEACOCK.

This very beautiful variety of an old favourite orchid has blooms of the largest size and of the finest form and substance. The flowers, beautifully poised on the spike, are pure white, with a few large red-brown blotches, these being grouped, horseshoe fashion, on the broad overlapping petals. It is not only a fine variety, but a very attractive one. F.C.C., R.H.S., January 31. Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

MILTONIA WARSCEWICZI VAR. PICTA.

A species that showed practically no variation for a long number of years has now given two distinct varieties within a short period. M. Warscewiczi picta is especially bright in its colouring; the basal half of the lip is purple, and the apical part white, the petals and sepals being yellowish-brown with bright yellow tips. A very showy orchid. A.M., R.H.S., January 31. Messrs. Charlesworth and Co., Haywards Heath.

BRASSO-CATTLEYA EUTERPE.

A pretty hybrid, with flowers of medium size, and with a lip less heavily fringed than in the case of hybrids direct from Brassavola Digbyana. Cattleya Schilleriana and Brasso-cattleya Digbyana-Mossiæ are the parents of B.-c. Euterpe. The new hybrid is rather dwarfer than the original brasso-cattleyas. The lip is rosy-mauve, with a soft yellow throat, while the bronzy-green shading on the rose-pink sepals and petals shows the influence of C. Schilleriana. A.M., R.H.S., January 31. Lieut.-Colonel Sir G. Holford, Westonbirt.

ODONTOGLOSSUM MARIÆ.

A pretty orchid, of which only a quite small plant was shown, therefore older plants should be even more effective when flowering. The parents are Odontoglossum Uro-Skinneri and O. Harryano-triumphans. The lip is veined and shaded with rose-purple over a white ground, and the sepals and petals are pale yellow-green, marked with red-brown. A.M., R.H.S., January 31. Messrs. Charlesworth and Co., Haywards Heath.

CYPRIPEDIUM DUKE OF CONNAUGHT.

This very distinct hybrid is from Cypripedium Beryl crossed with C. nitens G. F. Ball's var. The flowers are large and shapely, the dorsal sepal being broad, brilliant green, spotted with black-purple and edged with white. The petals are vivid green with brown and yellow shading, and the lip is of similar colour. A.M., R.H.S., January 31. Messrs. Armstrong and Brown, Tunbridge Wells.

ADIANTUM FARLEYENSE VAR GLOIRE VAN MOORDRECHT.

This is a beautiful fern, that appears to have been raised from A. farleyense in the nursery of Mr. J. Bier, at Moordrecht, in Holland. A. Farleyense has hitherto been regarded as barren, though possibly it has produced spores here and there, unobserved, but the remarkable thing is that this new variety is abundantly fertile, and its pinnules are prettily crisped. The fronds are larger than those usually found in A. Farleyense, stronger, less dense, and rather more elegant, though not more beautiful. A.M., R.H.S., January 31. Shown by Mr. A. A. Fabius, Redlands Nursery, Emsworth.

Referring to this new fern, Mr. Charles T. Druery writes as follows: That Queen of all the Maidenhair Ferns, Adiantum farleyense, which originated in Barbadoes as a sport from A. tenerum, has long been reputed as perfectly barren, and its true plumose form justified the belief. From time to time, however, vague reports of partial fertility have transpired, but as no results were obtained from the presumed spores they were apparently fallacious. On the 31st ult., however, a very fine variety of farleyense was exhibited at the Royal Horticultural Hall, by Mr. A. A. Fabius, Redlands Nursery, Emsworth, under the above name, it having made its appearance as a sporeling from farleyense in the nurseries of Mr. J. Bier, at Moordrecht, in Holland. The plant shown was very robust, with fronds several feet long, borne more erectly than those of the parent, and with the pinnules prettily crisped, many of which were freely fertile, while the spores, as evidenced by small seedling specimens, produce the "Glorie" form truly. It is claimed by the grower that this form requires far less heat than does Farleyense, the huge specimen shown having been fully developed under the cool culture suitable for A. cuneatum, a feature which adds considerably to its value as a popular contribution to our wealth of decorative ferns. It was given an Award of Merit, but would have fully justified a First Class Certificate.

Cannas.—A well-grown bed of cannas, providing it is in the correct place, is an attractive and striking feature. As good growth is necessary before planting out, it is desirable to commence propagation at once. This may be accomplished either by sowing seeds or by rooting the young growths which are produced by the old plants. If the method of raising a stock from seed is resorted to no time must be lost. The seeds require soaking a few hours before sowing, and when sown should be placed in the cucumber house to germinate. When propagating from old roots these must now be placed in heat, and in about a fortnight or three weeks they will be ready for division. The young growths which will be found coming from the sides of the stems are the parts to select. These very often have roots attached, and should be potted up singly, using a large 60-sized pot for the purpose. The propagating house, or cucumber house, if the former is not available, is a suitable place to grow the plants in, potting them when necessary. When good growth is made they may be removed to a warm greenhouse, eventually hardening them off.—E. C. P.

ROSA PERNETIANA—II.

In the first of these articles we noted that the term Rosa Pernetiana had no reference whatever to any newly-discovered species, but that it was the title given by the originator, M. Pernet Ducher, to a new class of perpetual flowering roses derived in part from Rosa lutea or Austrian Brier. As in 1830 Rosa Noisettiana stood for a new break in roses originated by M. Philippe Noisette, so in 1908 Rosa Pernetiana is the name of a new series of roses raised by M. Pernet Ducher.

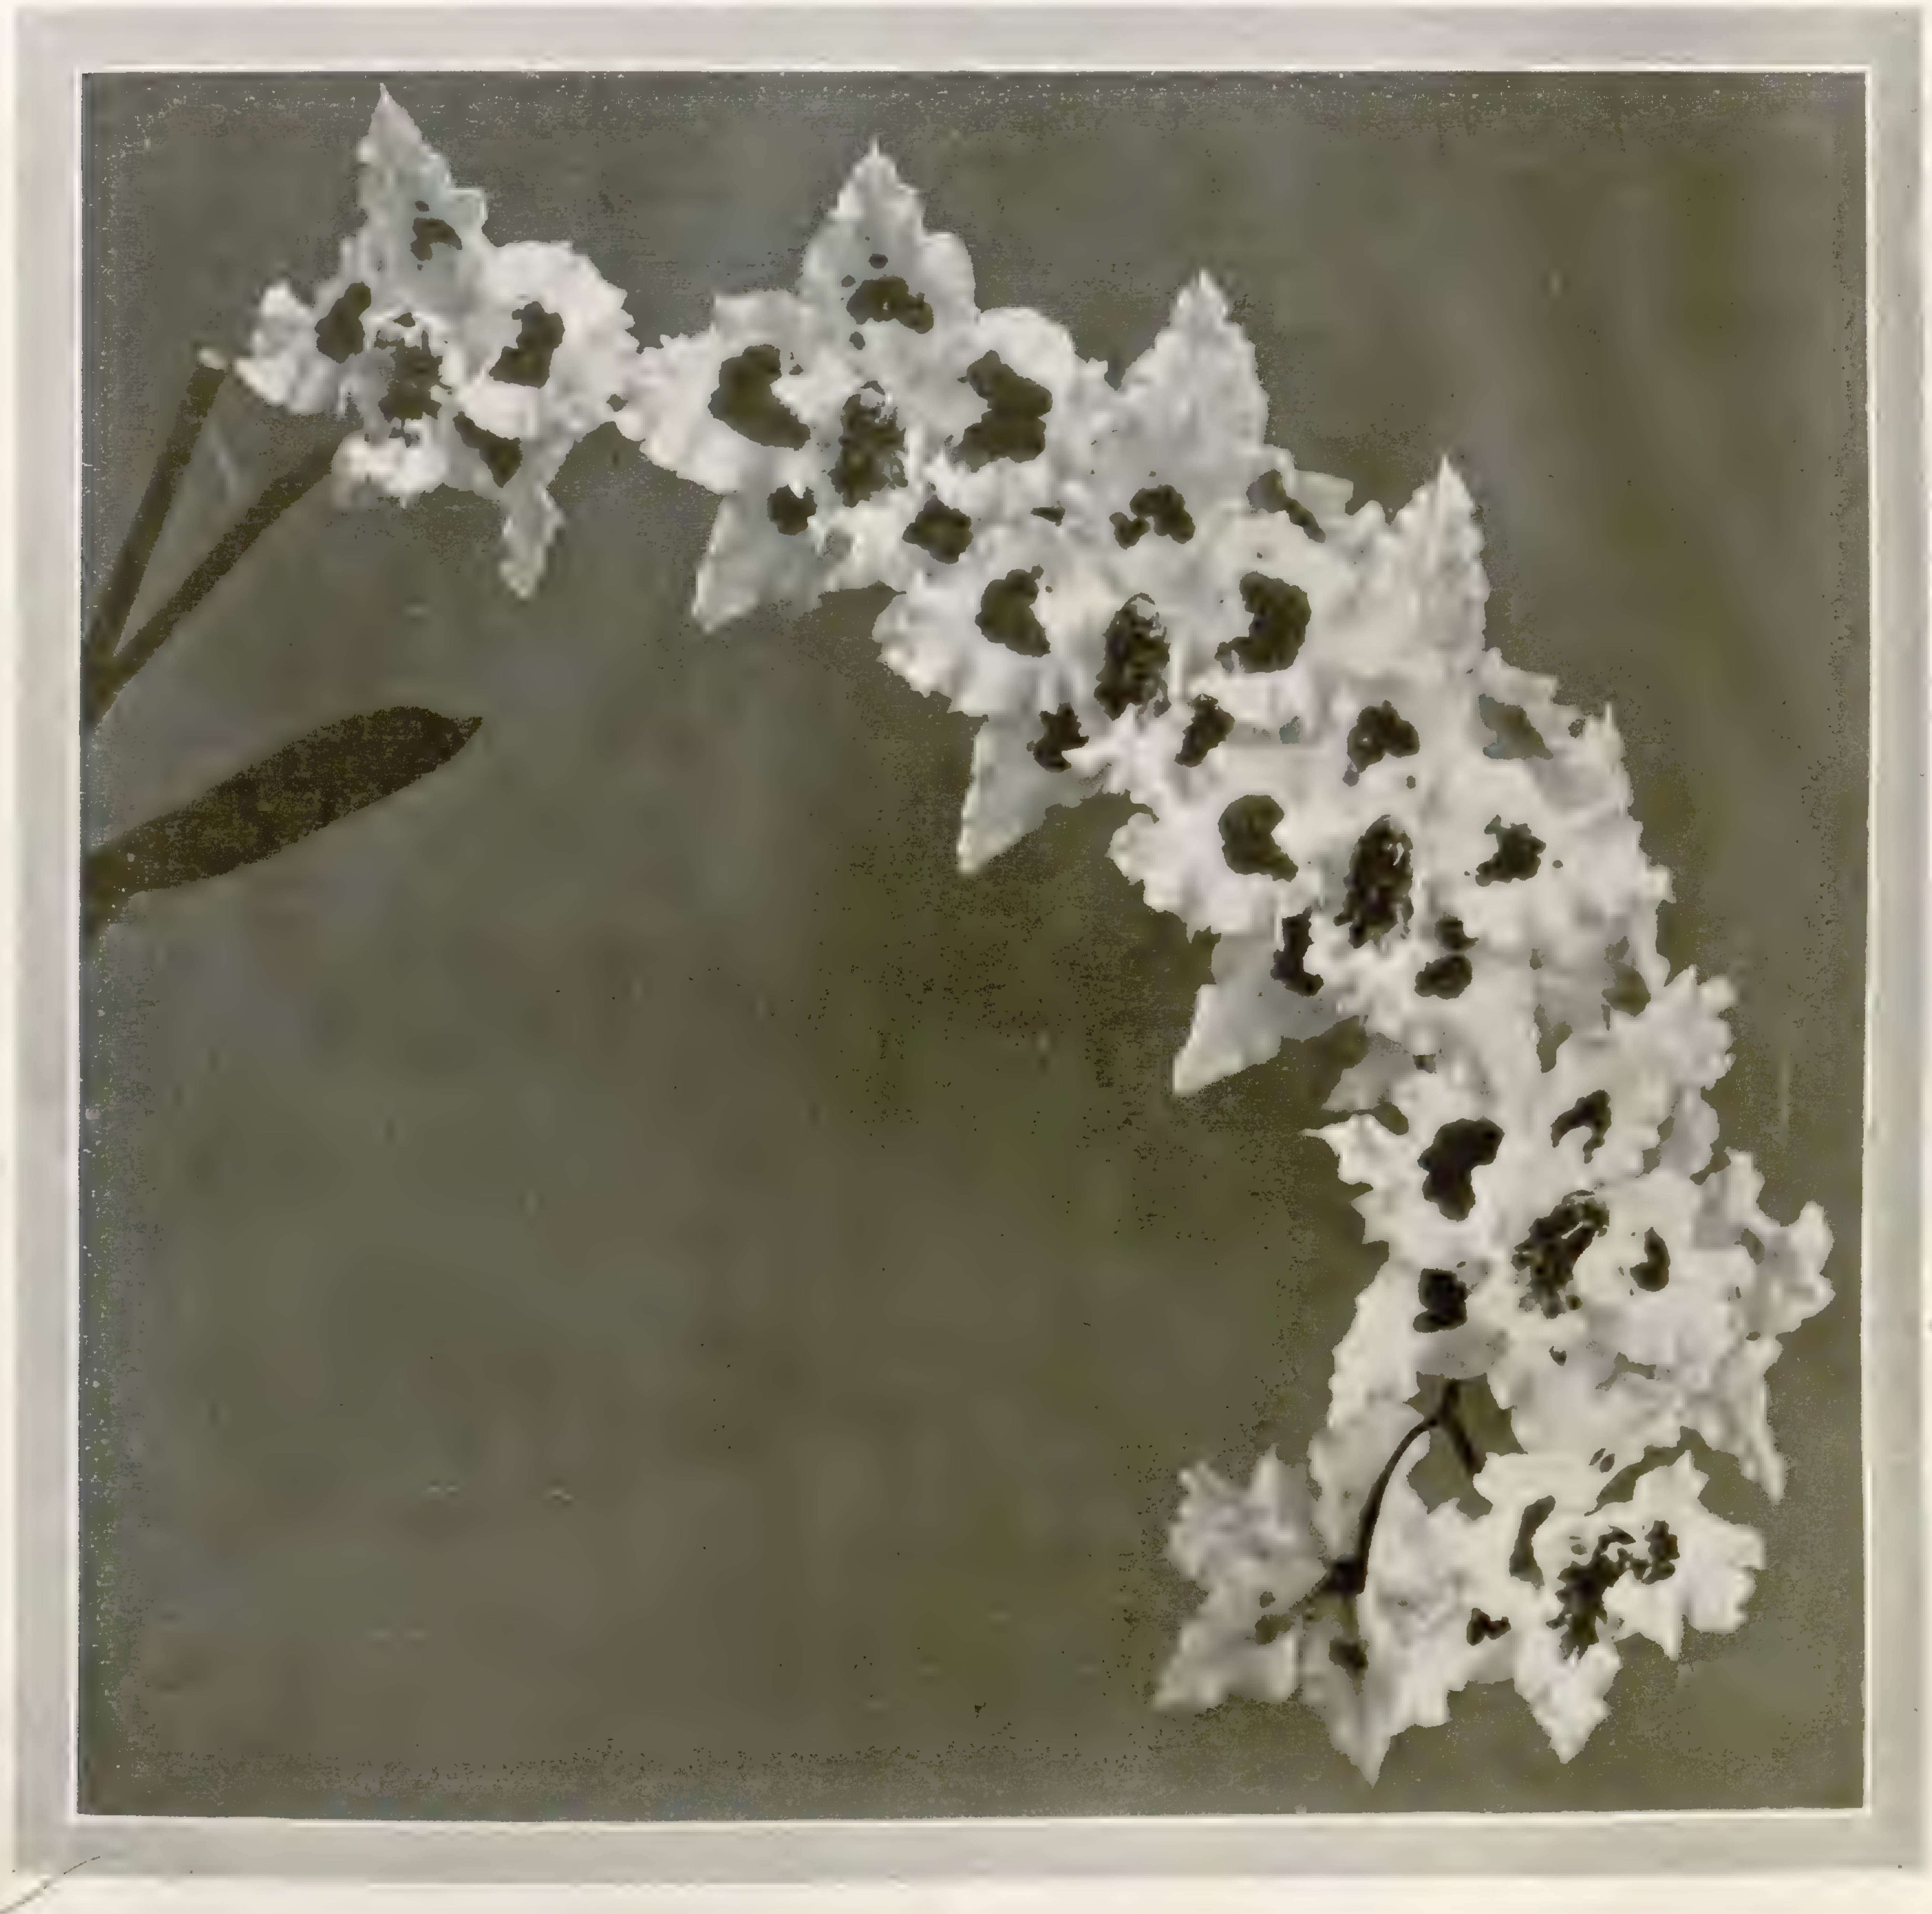
To distinguish varieties of the Pernetiana group from others we should be aware of the special characteristics of Rosa lutea from whence they derive in part their parentage. All at present sent out have some points in common with the species. Perhaps the likeness is more readily seen in the prickles, which are not dog-toothed, hooked, or solitary, but are straight, irregular in length and dense. In some we can see the rich brown wood and lanceolate form of the leaflets, but throughout the entire group a decided deep yellow tint, the dominant colour of the species, more or less prevails. We can see it in the Lyon Rose as well as Soleil d'Or and Rayon d'Or. Now let us glance briefly at some of the leading roses of this race.

Soleil d'Or, 1900 (Pernet Ducher).—Here we have the first of the series. This variety has many features in common with the Austrian brier, Harrisoni, introduced by Mr. Harrison in 1830. We detect this resemblance in wood, prickles, foliage, and deep yellow of the flower. The shape of the blossom, however, is more globular and cupped, and the colour is deeper, inclining to orange. But whereas Harrisoni makes a strong growing bush, and has only one crop of flowers, Soleil d'Or is dwarf and perpetual. It is this last-named quality that has made it a valuable addition to the rose world. It is quite hardy, and of upright habit, growing to about three feet in height.

Lyon Rose, 1907 (Pernet Ducher).—After an interval of seven years the next of the series made its appearance, the Lyon Rose. In some ways it so much resembles a hybrid tea, especially in the shape of the flower, that, its parentage being unrecognised, it was at first classed and exhibited as such. But a closer inspection revealed the Rosa lutea strain. We see it in the prickles, which are scattered, straight, and unequal in length, and the reddish brown wood. The foliage, too, is lanceolate, and has from five to seven leaflets. Few roses have risen into popularity more speedily than this, owing to the novelty of its colouring, a kind of shrimp-pink, suffused with deep orange yellow, difficult to describe, but now well known. It is free-flowering, perpetual, and fragrant. It will soon be a universal favourite.

Arthur R. Goodwin, 1909 (Pernet Ducher).—This rose has a marked relationship with Soleil d'Or. The habit is dwarf, the flower of medium size, cupped globular. Colour variable, from coppery-orange to salmon-pink. It bids fair to be a good decorative variety.

Rayon d'Or, 1910 (Pernet Ducher).—Another step in the evolution of Rosa Pernetiana has been reached in this variety. First Soleil d'Or, then Arthur R. Goodwin, now Rayon d'Or. What will be the next step? The possibilities are great. If for nothing else, the year 1910 will for long be memorable as the year in which this glorious rose was put into the hands of rosarians. At last we have a pure deep



ODONTOGLOSSUM CRISPUM PEACOCK.

Flowers pure white, with brown-red blotches. F.C.C., R.H.S., January 31. Lieut.-Colonel Sir George L. Holford.

yellow free-flowering bedding rose, by the side of which all other yellows, not excepting Maréchal Niel, are pale in comparison. As yellow as the yellowest march marigold or king cup. What the yellow calceolaria was to those who resorted to "bedding out" in mid-Victorian days,that will Rayon d'Or shortly be in the rose garden. Visit a garden where there is a bed of this rose, you descry it at once in the far distance. Many grand new roses were exhibited last year at the National Rose Society's show in Regent's Park, but Rayon d'Or surpassed them all. There it was staged naturally, as cut from the plant. As it was in the garden, so it was in the tent. It had been subjected to no tying, no shading, no wiring. The flower in the bud stage is deep orange streaked with red, opening out to brilliant yellow. Of vigorous habit, branching, bronze-green foliage, apparently mildew proof, and free-flowering.

Beauté de Lyon, 1910 (Pernet Ducher).—For a description of this rose, the progeny of Soleil d'Or, we must, for the present, rest content with that given by the raiser, who states it to be "a robust and very vigorous grower of strong and erect branching habit, with beautiful bright green foliage; the flower is large, full, and globular, expanding always well; superb colour, coral red, slightly shaded with yellow."—"Although perpetual flowering it cannot be qualified as free blooming."

Viscountess Enfield, 1910 (Pernet Ducher).—Another variety having Soleil d'Or as one of its parents. Habit erect, branching, prickles scattered, straight, foliage bronze-green, flower cupped, deep petalled, of medium size. Colour coppery-rose, suffused yellow, free-flowering, distinct.

Rodophile Gravereaux (Pernet Ducher).—This rose is classed by the raiser as a Pernetiana, but is not perpetual. It is described as a semi-climbing Wichuraiana, with flowers of carmine pink with yellow centre.

This completes this list, so far as the writer is aware, of Pernetiana roses sent out by M. Pernet Ducher. Some half-dozen more by other raisers remain to be noted. Joseph H. Pemberton.

Hippeastrums (Amaryllis).—A few of the earliest bulbs may now be started by placing them in a light position, free from drip, with an intermediate temperature of 55 degrees, rising about five to ten degrees during the daytime. Plants so treated should be allowed to remain in the old pots for another season; they should, however, be grown separately from the main stock, be fed more liberally during their growing season, and repotted again during the spring of the next year. During the early part of February the whole batch should be examined, with a view to repotting all those that need it. I strongly advocate the culture of amaryllis in medium-sized pots, as, given regular assistance when the pots are filled with roots, my experience is that a much larger percentage of flowering bulbs is obtained than if too much root room is allowed. The potting compost should consist of best quality fibrous loam, leaf-soil (oak), and coarse silver sand. Previous to repotting the bulbs may be thoroughly cleansed, and all the loose skin removed. The most essential item in the successful culture of these valuable spring and summer blooming bulbs is to retard the growth previous to flowering as much as possible; this is brought about by allowing the bulb to remain dry for as long as possible until the flower spike is well advanced. After blooming the plants are best plunged in beds, and there allowed to remain until the time arrives for ripening the bulbs. — John Donoghue.

FLAVOUR OF MELONS.

That a considerable number of melons grown in private gardens lack the most valuable quality that a fruit can possess—excellent flavour—will, I think, be generally acknowledged by those who have had much experience in judging at ordinary horticultural shows. Of all fruits an inferior flavoured melon is perhaps the most disappointing and distasteful, and as the same expense is incurred in growing a badly flavoured as a highly flavoured one, it is most important that in the culture of the melon everything is done to insure good flavour.

Apart from the fact that he cannot control the weather, and we all know what marked influences this has upon the flavour of melons, the cultivator may have all within his power wherewith to secure fruit of excellent quality. In the first place seeds of the very best varieties can be readily procured, but when this has been done, raisers of their own seeds must endeavour to keep the stock true, for there is no question that inferior melons are to be met with, some of them bearing the names of good varieties, and this owing to carelessness in saving seeds. It is the best plant to obtain each season from a reliable source fresh seeds of valuable varieties, rather than to sow those that have been thoughtlessly saved at home. Relative to this, however, it may be remarked that any good grower may keep his stocks true, for instance we still have Hendre Seedling true to name, having kept it so, since, with Blenheim Orange, it was first distributed by Messrs. Jas. Carter and Co. It may not be remembered, except by those interested, that these varieties before being distributed were exhibited at one of the R.H.S. shows, when in strong competition Blenheim Orange took the leading, and Hendre Seedling the second prize.

New melons are yearly introduced, but for a number of years there has been little, if any, advance in point of flavour. Those who have grown the once popular varieties Turner's Scarlet Gem (which requires skilful management to prevent its fruit splitting), Read's Scarlet Flesh, and the true Golden Perfection, will doubtless concur with this statement.

Of diseases that detrimentally affect the flavour by impairing the plant's vitality canker and gumming are the most prevalent, but these maladies, though aggravated by dull and wet weather, are very much under the cultivator's control, and seldom seriously injure well managed plants. Rich compost, especially if not made firm, is favourable to disease development, as are likewise excessively moist or sluggish atmospheric conditions, more particularly if attended by low temperatures. They may also be caused by keeping the soil too wet, and especially if the soil is kept close up to the stems. Crowding the shoots, and neglect in the early rubbing out or stopping of them, are also liable to promote or increase these evils.

If, however, the best varieties are cultivated and kept free from disease fruit of high flavour cannot be secured unless the leaves are preserved in a healthy state, and to this end it is essential that they are kept free from red spider. Attacks of this troublesome insect quickly injure the leaves and prevent them properly carrying out their functions; the pest abounds in a dry atmospheric condition, or where there is a deficiency in the supply of nourishing root moisture. Relative to this it may be observed that mistakes are sometimes made by diminishing or withholding supplies of root moisture, with a view to advancing the flavour before the fruit reaches maturity. Sufficient water should be given to keep the leaves from flagging up to the time the fruit is ripe and removed from the plant.

Fresh air has a marked influence on the flavour of melons, and unless the fruit is subjected to a fairly free circulation of it during the later stages of its development, it will not possess first-rate quality. This brings to mind an incident that once proved to be both discomposing and amusing to me, which I may be pardoned for alluding to here. Some 30 years ago the Messrs. Daniels, of Norwich, distributed a new melon under the name of "Luscious and Melting," and offered a substantial money prize for the best fruit of it exhibited at a meeting of the Royal Horticultural Society. With the intention of testing the variety and exhibiting it, I raised plants, and for the want, at that date, of a better available place, planted them upon a bed of tree leaves placed in an otherwise unheated pit. I found, on nearing the date of the show, that the fruit was somewhat far advanced towards maturity, and consequently ventilated the pit unusually freely, both by night and day, in fact the lights were left more or less side tilted. My fruit, when staged, presented a rather sorry spectacle as compared with those of the other exhibitors, and it was concluded that I had no chance of pocketing the prize money. After receiving some good-natured banter from some friends about my fruit, I left the hall for the day, and on returning in the evening for the melon, I found nothing of it left but the seeds, and some rind cut in narrow sections, but the prize card bearing my name was there, and I was informed that my fruit was the only full-flavoured one among the several staged. So much for pure air. T. Coomber.

CALCEOLARIA CHELIDONOIDES.

This half-hardy annual is rarely met with in private gardens, and yet it is one that is worthy of extended cultivation. I believe it was introduced to this country in 1852 from Peru, and it is described as growing one foot in height and having small yellow flowers. On very poor soil this may be the case, but given good cultivation it will attain a height of three feet. On looking through the various seed catalogues received I find that Messrs. Webb and Sons, of Wordsley, are offering seed, and the wonder is it has not been offered before.

This notice has induced me to say a word in favour of it. We sow seed of it here with the half-hardy annuals in March, and when large enough to handle prick out the seedlings into boxes, four inches apart, and finally plant out into a bed that has been previously prepared with some good loam, to which has been added some well-decayed manure and leaf-mould. When the plants have attained a height of one foot we place well-branched sticks, about two-feet long, between the plants all over the bed to keep them upright in rough weather, and the sticks are not seen when the plants are in flower.

I had seed given to me some years ago from a garden in Bettws-y-Coed, where it grew about a foot in height on the rockery, and reproduced itself year after year. Apart from its beautiful yellow flowers the foliage is very handsome. We have not used it in a cut state for decorations, preferring to admire its beauty in the beds.

W. H. Shaw.

ROSE NOTES.

By the time these notes appear many will be thinking of pruning roses in very warm and sheltered places. Under any circumstances I would delay until the middle of February, as I am quite sure the majority of roses are pruned too early. I do not propose going into this question fully, for so much has been written that the subject is getting monotonous, but a little more thought and less eagerness to follow on the old orthodox lines are needful, more especially now we have such a vast and wide difference in almost all classes of roses. Nor is sufficient thought given to the quality or quantity of blossoms that are required, and I need scarcely say the plants should be pruned with this point in view.

Buds of last season continue to look promising; so, too, does the wood upon most varieties. But we often have our most trying weather later than the time of writing (end of January). The rather sharp frost of a week ago, when we had 7 to 10 deg. here, occurred when the air was still, and I do not think did any harm. It is the wind accompanying frost, and sharp frosts at night followed by a bright sun, that do most harm so far as I have observed; and I believe our roses could endure double the frost we have, and without more harm, if the weather remained dull and quiet.

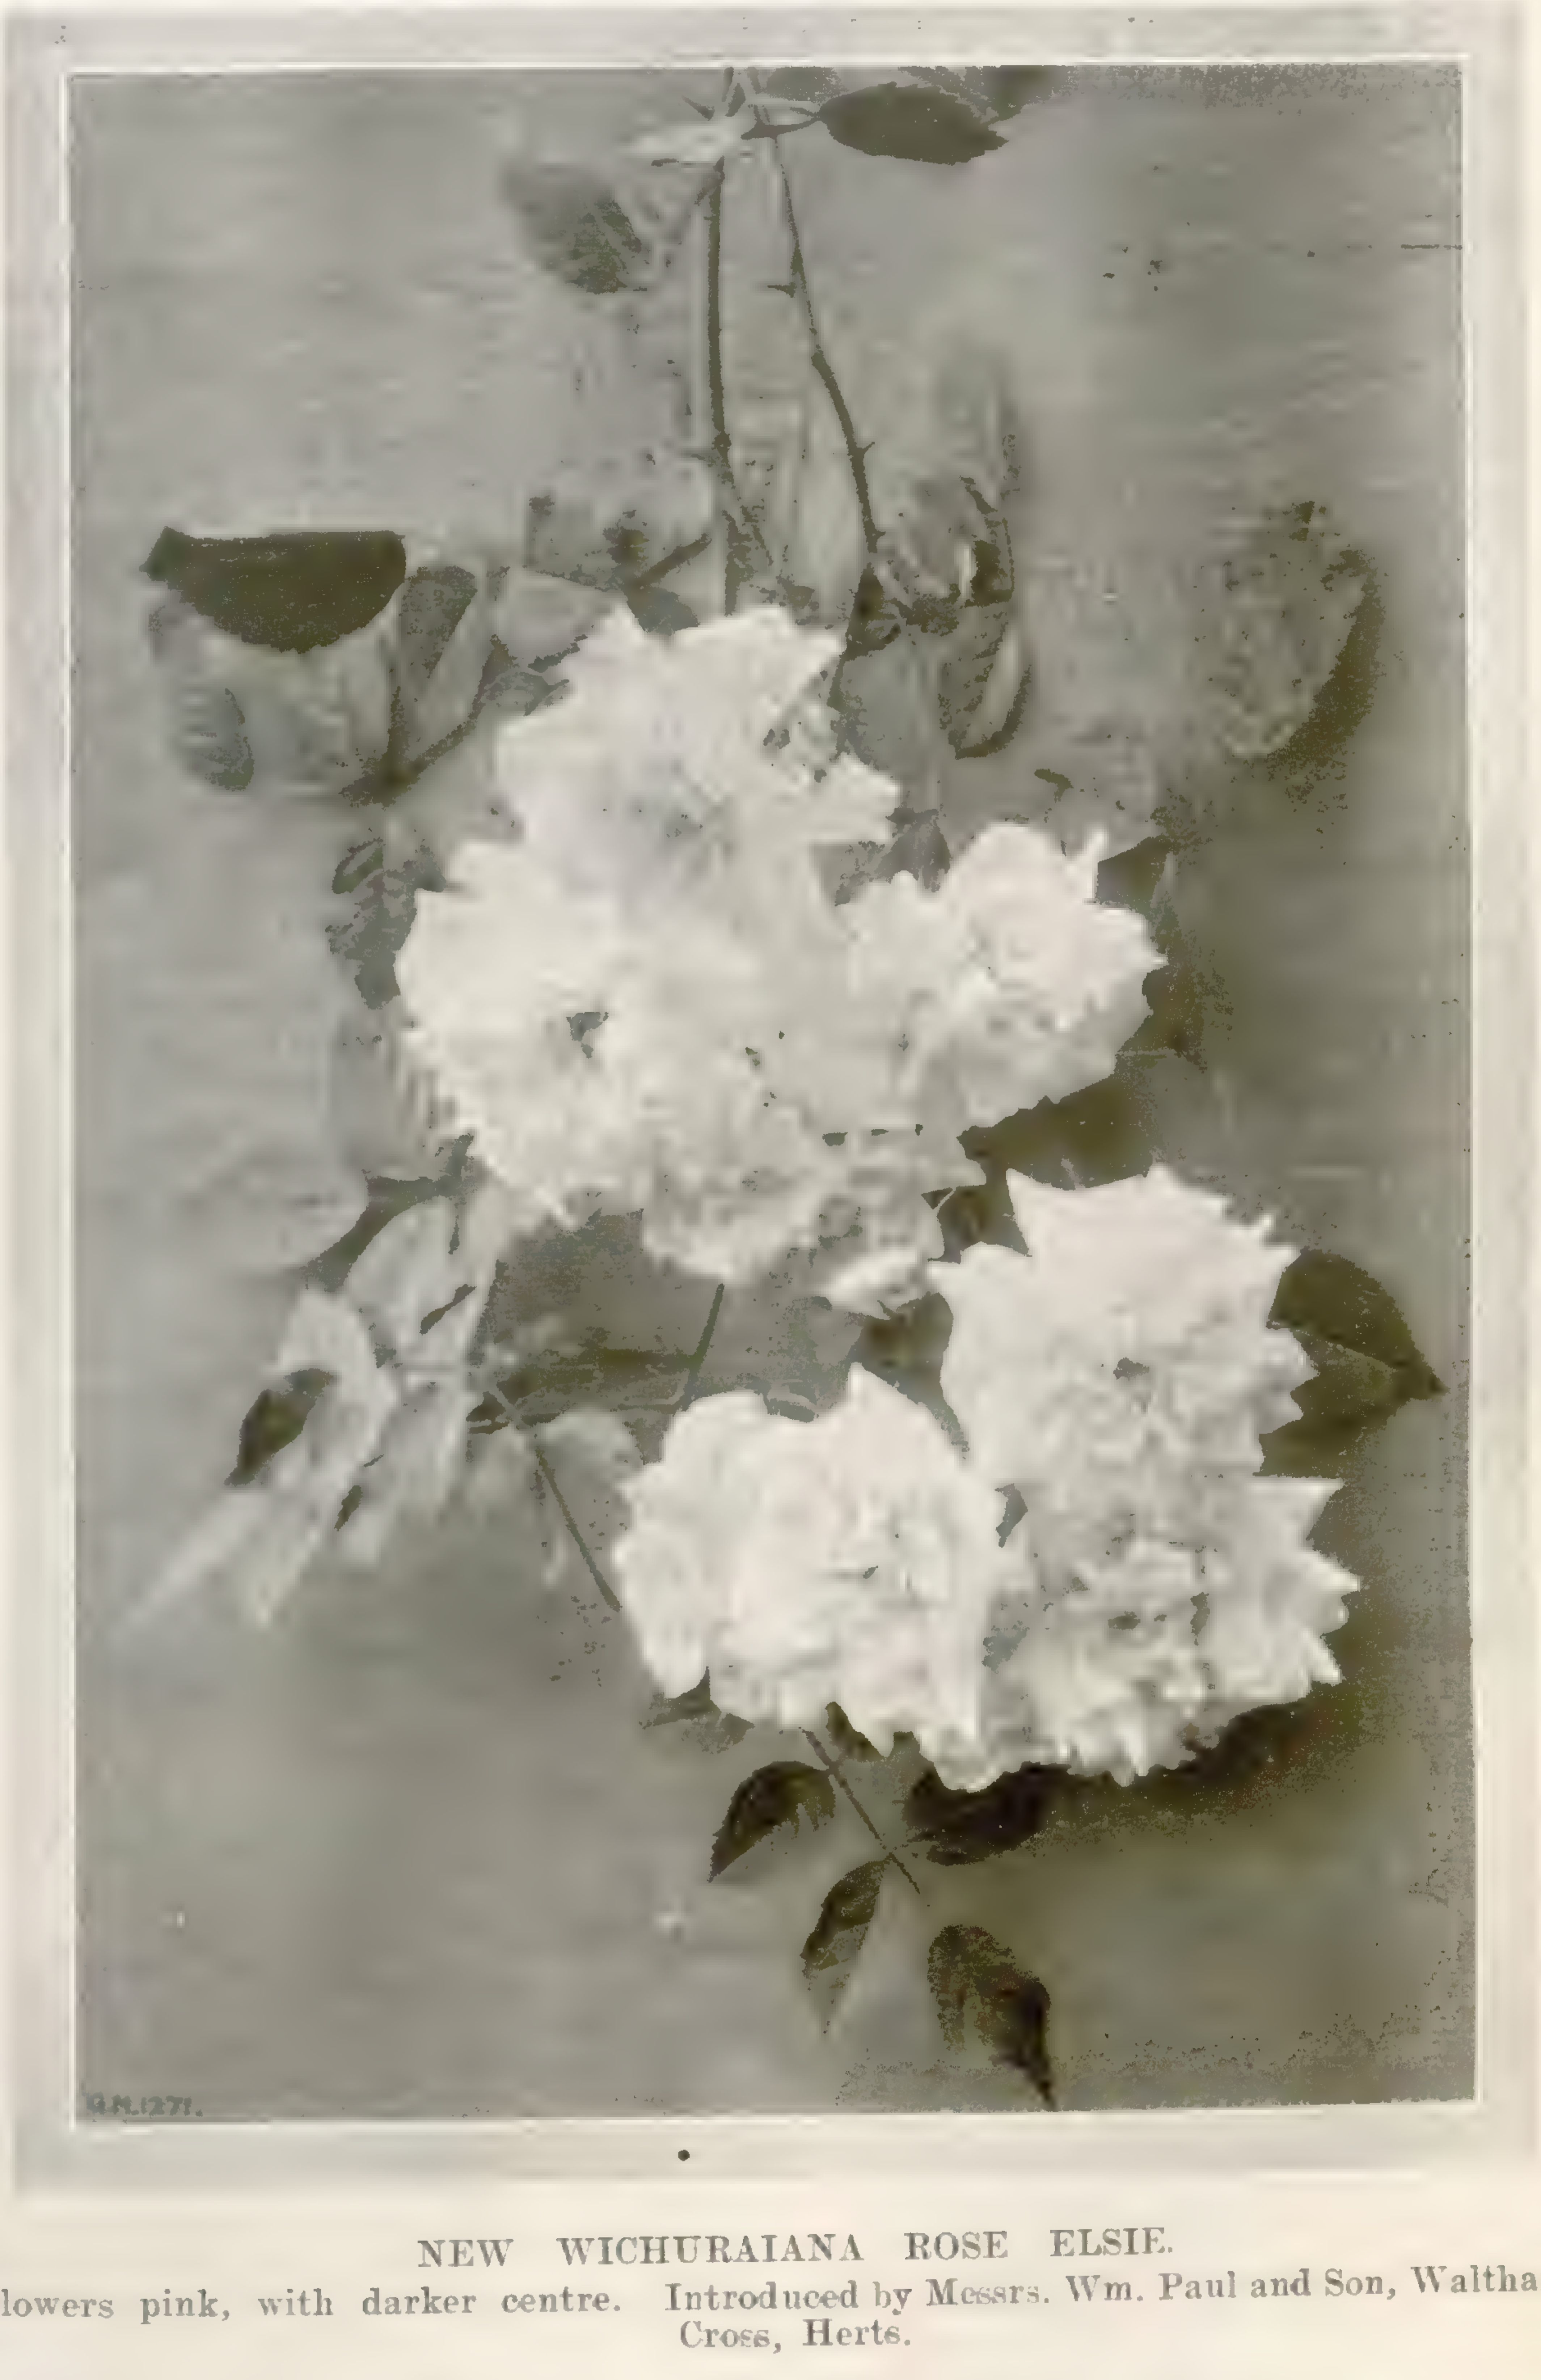
A friend recently called my attention to a considerable amount of wood upon plants that he thought were affected by frost, but upon closer examination it was found that growth was so late during the mild early winter that it had not become matured. Although the plants look a bit distressed at the present time, the whole of that wood will have to come away when pruning is done; the sound, matured wood and eyes are still unaffected.

The frost has drawn up the rose cuttings inserted last autumn, and it will be advisable to press these down as soon as one can work upon the soil. There is almost certain to be a few blanks in the rose beds, or a plant that does not promise well enough to stand another season, and advantage should be taken to thoroughly prepare the ground for a new occupant as soon as convenient; the best plan will be to insert a plant turned out of a pot.

Growth is good on young plants under glass; in fact, as good as I ever remember it, but care should be taken to wage war against insects as soon as they appear—you cannot commence too soon—and to avoid any draughts or checks likely to cause mildew. A. Piper.

ROSE ELSIE.

This charming hybrid Wichuraiana rose, introduced by Messrs. William Paul and Son, Waltham Cross, was remarkably well shown by that firm on several occasions during 1910. We saw some plants of it flowering finely in one of the big rose houses at Waltham Cross last May, and were struck with its grace and beauty. Of free growth, and with shining foliage, this newcomer, Elsie, lacks nothing in respect of vigour. Its flowers are shapely and double, and borne in large drooping trusses. The colour is flesh-pink, with a rather darker shade of pink in the centre. Even in the comparatively small truss illustrated there are a dozen flowers and buds and the individual blooms are invariably of large size for this particular group of hybrid roses.



NEW WICHURAIANA ROSE ELSIE.
Flowers pink, with darker centre. Introduced by Messrs. Wm. Paul and Son, Waltham Cross, Herts.

ASHES.

The beneficial effects that follow upon the application of wood ashes to various crops have been observed for ages, and they were probably the first non-animal manure to be used. The ashes from the garden bonfire and those from wood fires in the house may be regarded as practically the same thing for the purpose of these notes, and an average sample may be regarded as containing from 5 to 9 per cent. of pure potash (equal to 9 to 16 per cent. of sulphate of potash), 5 per cent. of phosphate, and 30 to 40 per cent. of lime. Of these elements the potash is the most valuable, but, being soluble, is very liable to loss if not taken care of. The object of these notes is to point out the best use to which this valuable substance can be put.

If the ashes are left for weeks where the fire goes out, a large part of the potash may be washed into the soil at that one spot, and be to a great extent wasted. They should be gathered up as soon as cool, and either stored away in a dry shed, to be used as wanted, or applied immediately to those parts of the garden where they will do most good. One of the best uses to which they can be put is for dressing the permanent fruit plantations, the soil of which tends to become poor in both potash and phosphates, partly through the exhausting character of the growth and cropping of the trees, and partly because stable manure, though possibly applied in quantities which supply sufficient nitrogen, does not make good the whole loss of the other constituents. Gooseberries especially need potash, and so do strawberries, while all stone fruits, in addition to this, need lime and phosphates no less. The demands of all these, and those of the beds of asparagus, rhubarb, seakale, roses, etc., together with the clematis (lime-loving plants) and choice shrubs and climbers generally, should be satisfied before any is used as a general dressing to the dry ground.

Where, however, wood ashes can be obtained in considerable quantities through the general use of wood as a fuel, it is as well to know that a certain portion of the potash consists of carbonate of potash, a substance which possesses the property of binding soils and making them sticky. Thus, while wood ashes may be a very desirable manure on light soils, not only for supplying the potash in which such soils are usually deficient, but by making them more retentive of moisture, this latter action is detrimental on heavy soils, and on such, therefore, should be used with caution. Where heavy soils are under good cultivation, however, as distinct from being occupied by permanent crops, a potash manure is rarely necessary, as mentioned above.

A word should be said about coal ashes in conclusion. Many soils have been greatly impoverished by the continued use of these over a number of years. They contain but little more mineral plant food than ordinary fertile soil, but they destroy the holding power of soil in time, and should, therefore, only be used to ameliorate very stiff soil. The practice of putting heaps of coal ashes over or around rather tender plants and shrubs in the winter is also one not to be recommended, as it invariably means that they become incorporated with the soil afterwards. Where, however, any wood ashes can be obtained during the winter from occasional wood fires, they should be carefully kept for this purpose, when they will both protect and feed the plants for the following season.

A. P.

MESSRS. JAMES CARTER AND CO.'S NEW PREMISES.

The removal of a large seed or nursery business is a matter not to be undertaken lightly. Increase of trade, and need for more room to deal with it, modern machinery and arrangements, better conditions for employees, and questions of rent and rates, all have their bearing upon the matter, while the advertisement that attaches to a prominent position long held in the busy haunts of men cannot be disregarded. The expense of removal is another considerable item, consequently there are many pros and cons to be discussed before any firm moves its business centre several miles from its old position.

It may be taken for granted that Messrs. James Carter and Co. fully considered this matter from every point of view before they decided to move their business from High Holborn, to Raynes Park, near Wimbledon. We believe they have acted wisely in moving their warehouses, seed stores, machinery, and the whole of the headquarters' staff and work out into the light and air of Wimbledon's western suburb. No expense has been spared to make the new premises as convenient as possible for the handling of a great business in garden and farm seeds, grasses, and bulbs; to make them of handsome appearance and fine proportions so as to bring credit and advertisement to the firm; and to make them as hygienic and comfortable as possible for the three hundred employees. When the splendid new premises were ready, and the great trek began, it was found that no less than 1,200 tons of seeds had to be sent from Holborn to Raynes Park, in addition to machinery, books, correspondence, etc.

The firm has now a freehold site of about twenty-two acres, with a fine frontage on the London and South Western Railway main line. The tram cars that run between Kingston and Wimbledon pass the main entrance, and Raynes Park Station, only a few minutes distant, is also served by the trams. Raynes Park is quite get-at-able, and as it is a large and growing district it is well served in the matter of trains from Waterloo or Clapham Junction. We feel sure that large numbers of interested people will visit the firm in its new home during the coming summer, and see for themselves the extensive trials of varieties and seed stocks that will be conducted there, as well as inspect the most elaborate and up-to-date arrangements for cleaning and sorting seeds, and testing their germinating power. Messrs. James Carter and Co. have no wish to hide any part of their work, and they welcome an inspection of their new premises and grounds.

It may be pointed out that the firm retains its shop at 237, High Holborn, and its newer one in Queen Victoria Street, near the Mansion House, and seeds and sundries are always on view here, but orders that necessitate the use of parcels post, carrier, railway, or ship will be despatched from Raynes Park, and their execution will be even more rapid than was possible when the seeds were kept in bulk at High Holborn.

Now for a few particulars.

The main building is 320ft. long, and 110ft. wide, with a basement 180ft. by 110ft. It covers a little over two acres, and, although the firm only took possession in September last, they find that, large as this building is, it is barely large enough for present needs, and so in the spring a large addition will be made, connected with the main building by a glass-roofed despatching department. It is pleasant to find that all the work is British, and lovers of statistics will be interested to learn that one million bricks, 4,300 tons of ballast, 2,000 tons of sand, 500 tons of Portland cement, and 200 tons of lime were used in the walls and floors. Six hundred tons of the best English steel and 400 tons of asphalt (which, by the way, required 130 chaldrons of coke to melt it), were used on the roof and floor; 12,000 superficial feet of glass were required, in all, a little over a quarter of an acre, and the paint shop worked up and used eight tons of paint and washable distempers.

The heating, a most important point for the comfort of all, called for one mile of four-inch pipes, forty-eight giant radiators, and a boiler with a capacity of 1,250,000 British Thermal units, a smaller boiler being installed for the employees' lavatories. These represent the last word in sanitary engineering, and cost by themselves the substantial sum of £2,500.

The "Tudor oak" panelling and marble flooring for the private offices and entrance hall amounted to 2,200 superficial feet, and the floor of the general offices contains 5,500 superficial feet of parquet flooring. The building is lighted by electricity, and the same power is employed for driving the machinery, for which installation eight and a-half miles of insulated cable were necessary to conduct energy of 300,000 candle-power. From these figures and particulars only a vague idea of the magnitude, beauty, and comfort of the building can be obtained, and to realise it fully one must see it in being.

The warehouse is built after the style of an orangery, with large French windows, is made of brick and finished off with white rough cast; the entrance is gained from the main road by a circular gravel drive, and two bold flights of Portland stone steps, guarded on either side by magnificent marble lions, 7ft. 6in. high, that weigh 25cwt. each. The portico, supported by four Portland stone columns, 14ft. high, and 6ft. in circumference, is decorated with a magnificent wrought copper Royal Arms, which stands 7ft. high, but which looks quite small, as do the four 5ft. dials of the clock (which, by the way, strikes the hours on a bell weighing 16cwt.) in the tower immediately above it, in comparison with the size of the elevation.

One passes from the beautiful entrance hall straight into the brain of the business, the private and general offices. In one office we find the managing senior partner, under whose direction the business has prospered so greatly, the other rooms being occupied by his partners and brothers, who are responsible for the finance, seed-growing, and the contracts of the firm, and the sports and games department. Beyond these offices are the bookkeeping and correspondence departments, with the post office and the seed-testing rooms, and beyond these again is the huge warehouse, where about two-thirds of the staff of 300 persons are at present as busy as they can possibly be executing seed orders that range in value from a few pence up to thousands of pounds. The small order is dealt with as carefully as the big one.

The large seed-cleaning machines are wonders of mechanical ingenuity. In them all dirt and dust is sucked up into a special compartment, all light seeds are blown into another, and the small seeds are separated from the full-sized ones, and delivered into different sacks. All the machinery is worked by electricity with a very modest amount of noise, and a total absence of dust and dirt. Peas, beans, and similar seeds, that have to be hand-picked after passing through the big machines, are fed into hoppers, from which they pass in a regular and steady stream on to an endless band that carries them directly under the hands and eyes of the operator. The seeds are spread thinly on the band so that the expert pickers (all women), can quickly extract all poor and doubtful-looking seeds, leaving the good sample to be carried into the waiting sack. These ingenious machines have each a three-speed gear that can be adjusted according to the kind of seed operated upon, or the rapidity of the picker.

As these pages have so frequently testified to the excellence of Messrs. Jas. Carter and Co.'s specialities in garden seeds, there is no need to discuss the point here, but, as giving some idea of the magnitude of the business in "tested seeds," it may be stated that the Garden Seed, Bulb, and Farm catalogues posted to the firm's 80,000 customers, weigh in the aggregate 86 tons 14cwt. 3 qr. 11lb., and this item does not include the smaller plant catalogues. Further, in the matter of seeds, the firm deals annually with about 50,000 bushels of culinary peas, 51,000 bushels of root crop seeds, 6,500 bushels of beans, 41 tons of seeds of the cabbage family, 1,300 bushels of radish, 25 tons of beet, 1,400 bushels of spinach, 10 tons of onion, 17 tons of carrot, 220 bushels of parsley, 10 tons of parsnip, 15 tons of sweet peas, 14 tons of nasturtium, and 3 tons of mignonette, while 10,000 plants of Chinese primulas are grown annually at Forest Hill to supply the seeds needed for retail orders. In lawn grass seeds the Messrs. Carter do an immense business, and, in addition to private orders, the firm has executed many very large ones for golf and other sports clubs, and in this connection alone upwards of 2,163 acres have been sown with their seeds during the last ten years.

Much more might be written concerning this new hive of British industry, but we hope that enough has been written to indicate its size, beauty, and comfort, and the wonderful business so enterprisingly and successfully carried on in it.

Miniature Heaths.—These, which are often seen in the florists' shops of London, seem to meet with a ready sale, and they must be grown in large quantities. This practice of growing a few kinds of greenhouse heaths, principally the small-flowered ones, as model little specimens in tiny pots, is a quite recent innovation. As these pots contain such a small amount of soil they must take a deal of water during the growing season, and the fact that they are apt to dry very quickly must be taken into consideration when they are used for indoor decoration.—W. T.

Hippophæ rhamnoides.—Complaints are often made that the sea buckthorn does not bear its pretty berries, and this is doubtless, in many cases at least, owing to the fact that the male and female flower are borne on separate plants. For this reason it is important to grow the two classes in association, the proportion of one to five or six being sufficient to ensure a crop of berries. This hippophæ is well worth a little attention in this respect, as the orange-coloured berries which are borne in great profusion are very ornamental.—W. T.

BROOMS.

There are at least two things to avoid when planting brooms; first, the specimen system, which consists of sticking in one each of this, that, and the other. A very proper system to follow in forming a collection for botanical purposes, but one that is utterly foreign to good gardening, and one of the readiest ways of destroying the beauty of this lovely genus. Plant if possible always in odd numbers, with three as a minimum, and if the ground can only carry a score of plants comfortably, confine oneself to four or five species at most, and these will add credit to the garden, and form an object-lesson in other directions.

Secondly, having introduced brooms to garden or grounds, continue adding to them at frequent intervals; do not wait till they become decrepit by age or mutilated by accident, but always maintain the vitality of the groups by the infusion of youthful vigour, for with brooms you must get away from the old tradition. "Plant once! Plant for ever," and to be able to always rejoice in the light-hearted loveliness that brooms bring to the garden in their flowering season, we must have plants in the vigour and prime of youth. Under favourable conditions many of the brooms will reproduce themselves from seed, and if carefully fostered in this direction, plants will spring up and group themselves in charming abandonment so characteristic of a child of Nature. And as regards the kinds to plant, one rarely errs in having Præcox, albus, albus durus, Kewense, purpureus incarnatus, and all the coloured forms of Scoparius, with Carlieri as the last in flower. To these add their half-sisters Genista Ætnensis, cinerea, and virgata, and the lovely yellow scented Spanish broom Spartium junceum, that flowers late in summer, and we may fairly claim to have the best.

Thomas Smith.

PEAR BEURRE SUPERFIN.

Raised some seventy-four years since at Angers by M. Goubault, this fine pear may be described as one of the best of the many excellent varieties that ripen during October and November, and as worthy of a place in the smallest garden in which pears are grown. The variety is, indeed, specially suited to gardens of limited size, for it can not only be depended upon to produce good crops but to bear fruit that will be fully appreciated when upon the table. These are two important considerations, and it is certainly not without interest that the fruits are of good appearance when they have reached maturity. The skin is pale green, with large patches of russet, which in some cases extend over the greater part of the surface. The flesh is rich, melting, and juicy, and somewhat resembles that of Marie Louise, but is rather more brisk. The tree is upright and compact in growth, and may be successfully grown in all the forms that find favour with cultivators. In the more favoured districts it makes an excellent standard, and in the Northern Counties of England, and in Scotland, it should have a wall, such shelter being especially desirable in gardens where the soil is naturally heavy and cold, and therefore unfavourable to the ripening of fruit and wood.

PEAR BEURRE SUPERFIN.

Jerusalem Artichokes. — When the soil is in a suitable condition lift the whole of this crop, select some medium-sized tubers, and plant them in a well-manured piece of ground for next season's crop. The remainder, if stored in sand in the root house, will keep satisfactorily until well in the spring. A distance of two feet six inches between the rows, and eighteen inches from plant to plant is not too much for this strong-growing vegetable.—C. Flack.

WORK FOR THE WEEK.

◆

COOL ORCHIDS.

COCHLIODAS.—No orchids in the cool house are more attractive than C. Noetzliana, and, where the plants are induced to grow satisfactorily, their long spikes of orange-scarlet flowers are in striking contrast to the odontoglossums and other orchids flowering in the late spring and summer months, especially so when there are large specimens displaying a number of spikes in bloom at the same time. The flowers are exceedingly durable, and are serviceable for many purposes. There is little variation, and, though one sometimes finds the flower larger and the colours specially brilliant, these slight variations can probably be attributed to robust growth and better ripening of the pseudo-bulbs in some plants.

POTTING.—We find that C. Noetzliana does not care about being repotted frequently, and the plants take some months to recover from a shift, even when attended to at the active rooting season. Provided the compost is in good condition, just remove the moss and surface of the old material and in its place put good new material. Any top-dressing required should be attended to at the present season, as the flower scapes are advancing from the developing pseudo-bulb.

SLUGS AND SNAILS.—Not only is this work more conveniently done now, but the removal of the old and decaying matter about the base of the pseudo-bulbs will give opportunities for the destruction of snell snails, slugs, and other destructive pests which may secrete themselves about the base of the plants. There can be no doubt that the greatest pests we have to contend with are slugs; if there is one in a house it generally finds the flower spikes of cochliodas in an early stage of development, and constant observation is necessary to protect them from these pests.

VARYING SEASON OF GROWTH.—We find that the plants do best when grown several together in the same pot, but those arranged together to make specimens should be at about the same stage of growth. It will frequently occur that a plant is thrown out of its usual season of growth; for instance, it may lose its spike at an early season and it will commence growing much earlier in the season than one that carries a spike of flowers. In the case of those being used for seeding purposes, the growth will be delayed, and so thrown out of its proper season. These items can only be remedied by careful observation at the potting season. We find that the cochliodas do best at the warmest end of the odontoglossum house during winter; and, as they are growing throughout the whole winter, they require liberal treatment, but if exposed to strong light during the spring and summer months the foliage is liable to spot and become disfigured; therefore a shady, moist position suits them best.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CANNAS.—These plants are most effective subjects for the conservatory, the flower spikes, together with the handsome foliage, making them specially noticeable. Of the various methods of cultivation in practice perhaps the following will be found to be one of the best, producing, as it does, splendid blooms of a gorgeous colour. Make a start immediately by shaking most of the old soil from last season's plants. Place in a shallow box, which has been well drained, keeping each variety separate. Cover with fine soil, taking care that all the roots are well covered. Thoroughly water in, and place in a temperature of 55 to 60 degrees. In a short time the sucker growths will appear. When about two or three inches long these may be taken off with a good heel, and inserted singly in small 60-sized pots, using a light sandy compost. Place them in a propagating pit, when they will be found to root readily. When rooted, remove to a lower temperature. When ready, shift into 48's, in which pots they may be allowed to flower. For this potting use a fairly rich compost, adding a little dried cow manure. As cannas are very accommodating in the time of flowering, they may be worked in batches, and so made to extend throughout a long season.

CHRYSANTHEMUMS. — Cuttings which have been potted, and have recovered from the check, should now be given air freely on all favourable occasions. Continue to pot off others struck later as soon as ready, never allowing the roots to become matted, or a serious check will be the result. Pot moderately firm to induce sturdy growth.

HYDRANGEA HORTENSIA.—A few of the old plants which have been wintered in frames may now be brought in to make specimens. Prune back to a strong bud, and, after top-dressing, place them in an early vinery, where they may be syringed. A batch of Lilium longiflorum and L. Harrisi may also be put into the vineries for early flowering.

ROSES IN POTS.—Continue to introduce relays of roses for forcing. The temperature should not be allowed to go higher than 45 degrees at night, rising five to ten degrees in the day. Avoid draughts and sudden changes in the temperature by careful ventilation. If a little artificial manure is used when the plants are top-dressed further feeding will not be necessary until they are in vigorous growth. As forced roses are very susceptible to attacks from insects and mildew measures must be taken to prevent them.

CONSERVATORY. — Steps must now be taken to procure plants for edging in the conservatory. Isolepis gracilis and Carex japonica should be split up into small portions and put into small pots to allow for a shift later on. Insert cuttings of panicums and tradescantias in variety. These all do well in a conservatory if properly hardened off. It is almost a necessity to have a few plants, other than those flowering, to relieve the colour of flowers and make new features. This may be done without encroaching on the palms, because well-grown plants of Grevillea robusta, Aralia Sieboldi, Ficus elastica, Araucaria excelsa, Aspidistra lurida, and its variegated form are all well suited for conservatory use.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

PLANTING.—No time should be lost in finishing the planting of fruit trees, so that the soil will have had time to settle before activity commences. Where the soil has not already been prepared, and it is proposed to plant a row of trees, start by bastard trenching, working a strip six feet wide to the desired length (or six feet square if for one tree); of course, this width would not be necessary for bush fruits. Afterwards dig the holes, according to length and depth of the roots, allowing for the topmost roots to be about four inches from the surface. Work the fine soil among the roots in thin layers, and tread each layer as the work proceeds; well ram with a rammer after the top roots are covered, finish off with three inches of loose soil, and a dressing of about three inches of stable manure. If the soil is very poor this latter may be removed in April, and a dressing of good farmyard manure substituted.

WASHING OR SPRAYING.—The importance of winter washing fruit trees is becoming more recognised by all good fruit growers, for it not only allows gardeners to send clean handsome fruit to the table, but it increases by more than one-half the yield of serviceable fruit. One is often asked: "What is the best wash for fruit trees?" That, of course, depends upon the enemy to be combated.

APPLE AND PEAR SCAB.—This disease is very prevalent throughout the country where apples and pears are grown, and stems and branches should be given a thorough drenching with sulphate of copper, used at the rate of 8lbs. to the 100 gallons of water, and while the trees are quite dormant. Follow this up with two or three applications of Bordeaux mixture during April and May. When using sulphate of copper only wooden receptacles should be used for mixing, and, if possible, for spraying.

APPLE SUCKER.—A great deal of damage is often caused, especially to young trees, by the apple sucker throughout the summer months, and any trees that had an attack last year should now have a good lime and salt wash. I had a great difficulty in keeping this pest under until I tried this excellent remedy. Obtain fresh lime of the best possible quality, and use at the rate of 1cwt. of lime and 40lb. of common salt to 100 gallons of water; dissolve separately, and mix together in the machine; dirty salt can usually be obtained at the butchers or grocers at very moderate cost. This wash is equally good for plum aphis.

SPRAYING MACHINES.—The success of all washing depends a very great deal on the machine and nozzle used for the separate washes. Where a small quantity of fruit only is grown, and a garden engine is at hand, this may be easily adapted to the work if a length of hose is fitted to the top of the pump. A coat of white enamel paint, such as is used for painting baths, should be applied to the inside a few days before being used, or damage will be caused to the machine by the action of the copper on the galvanised iron, not to mention a great weakening of the wash. Two nozzles at least will be required—a fairly coarse one for winter washes, and a fine one for Bordeaux mixture. Clear water should be always pumped through before putting the machine away for the day.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

ONIONS.—To secure well-ripened and early crops of onions a sowing of seed should be made in boxes now, and placed under glass in a temperature of about 50 degrees. Do not unduly hasten growth, but bring the plants along steadily near the glass. Prick the young plants off into other boxes as soon as they are large enough, and use a rich soil that is somewhat open. When once established the seedlings may be grown in a cool pit or frame, with a liberal amount of air on fine days.

CELERY.—Where early celery is required a small quantity of seed may be sown; this is somewnat slow to germinate in a low temperature, therefore subject it to about 55 degrees of heat, and cover the top of the box or pan with boards or slate to keep the surface of the soil in darkness, and uniformly moist. After the seedlings begin to grow freely a temperature 10 degrees lower is to be preferred. Avoid checks to growth; move the young plants from the seed receptacle early, and prick them out in boxes filled with rich soil; place out of the way of cold draughts, and at no time permit drought at the roots.

PEAS.—A sowing of an early variety, to form a succession to the pot-sown ones, may be made on a high and warm south border. Draw the drills from north to south, rather deeply, and sprinkle therein a moderate amount of wood ashes and soot, as these will form an aid to growth, and assist in warding off the attacks of slugs. The distance from row to row must be judged by the height of the variety grown, but five feet is sufficient space for all tall early peas, while for the dwarf kinds two feet six inches to three feet is enough. Early Giant, Gradus, and May Queen are all excellent for this sowing.

BROAD BEANS.—Where these vegetables are appreciated make a plantation in a warm aspect to obtain a few early dishes. The main sowing may be made at any time now in a more open quarter of the garden. These vegetables succeed on strong land, and give a longer supply on this than on light soils. Early Mazagan is yet one of the best for early gathering, while the many varieties of the long-podded types are capable of giving heavier yields for the main supply.

SPRING CABBAGE.—On a fine day we run the hoe among this crop, and at the same time sprinkle a little sulphate of ammonia or nitrate of soda round them to encourage growth. If the stock is short, make a sowing in boxes and raise the young plants under glass for pricking out in the open later.

GENERAL REMARKS.—Whenever the weather is favourable the work of manuring and digging should be pushed forward to allow frost and wind to provide sweet and friable seed beds. Where possible land should be brought into a proper condition by lightening heavy soils with rich sandy materials from the rubbish heap, etc., or by adding marl or turf to light quick ground which is so difficult to manage during extreme dry times. Batches of tarragon, mint, chervil, etc., should be forwarded by planting roots in boxes or pots, and placing them in a little heat.—Charles Flack, Cholmondely Castle Gardens.

Berberis Thunbergi minor and B. stenophylla Irwini.—Anyone familiar with the sterling qualities of Berberis Thunbergi will readily appreciate the value of its miniature counterpart. It has all the good qualities of the type, producing cream-white pendulous flowers in spring, and in autumn becoming brilliant in leafage. The contrast in habit between the type and variety is strikingly evident in established plants, as the variety minor rarely attains to a third of the dimensions of the type. In a similar way the well-known Berberis stenophylla has its miniature counterpart in the variety Irwini. These dwarf forms are of inestimable value on rock gardens, where limited space precludes the use of stronger kinds; they also succeed on low banks, and may often be used as edging or carpet plants to shrub beds, in which form they create a distinct change from the usual run of groundwork subjects.—L. O. V.

THE HOME TIMBER OUTLOOK AND THE URGENT NEED FOR AFFORESTATION.

On the occasion of the annual meeting of the Aberdeen branch of the Royal Scottish Arboricultural Association Mr. Donald Munro, of Banchory, delivered an intensely interesting and practical lecture on the above-named subject, and the following is a résumé of his remarks:

Signs of Exhaustion.

After referring to the danger of exhaustion of foreign and Colonial forests, Mr. Munro said: From my own personal experience, I can say that in Scotland we are pretty near the end of our resources. We seem to have been cutting down timber with what I might term a cheerful abandon, never pausing for a moment to consider the question of replanting, and, when one mentions the subject, it is a matter of surprise to find how many people are under the impression that we possess very large resources in the north—resources that, according to them, have not been tapped. This, however, is not the case, for although there is still a good deal of wood in Ross and Cromarty, Inverness, Elgin and Moray, and Banff shires, there is not more than sufficient to keep the mills already working in these counties many years. The same story is also applicable to the once great timber areas in Perthshire, Argyleshire, Forfarshire, Dumfriesshire, and Ayrshire. In our own immediate neighbourhood, namely, in Aberdeenshire and Kincardineshire, the supply is very far from being equal to the demand. It is an easy matter to point out the estates within fifty miles of Aberdeen where any great acreage of woodland exists. Commencing with Deeside, we have Durris, Crathes, Ballogie, Finzean, Craigievar, Glen Tanar, Abergeldie, Invercauld, Mar Lodge, and Balmoral, but it is doubtful whether some of these can be taken into account, as on several of these estates there is every probability of the timber never being sold. On Donside and vicinity there are the Fetternear and Cluny woods, and the woods of Strathdon, while on the north-western part of the county we have the famous Binhill woods at Huntly, and we have still some fine old wood belonging to the Dukes of Fife and Richmond and Gordon in Morayshire, while on the Dowager Countess of Seafield's estates there are some 30,000 acres of wood, of which, however, about 20,000 has been planted during the last 45 years, on ground formerly valued at 8d. per acre.

After reminding his hearers that what is left of our home timber is getting further and further away from our only means of transit, Mr. Munro proceeded to deal with Scotland's suitable forest land, in the course of which he said: I need not remind you, gentlemen, that there are millions of acres lying waste, or bringing in not more than 6d. per acre to the proprietors—acres that could be utilised at very little expense, and turned into the finest timber-bearing land in Europe. In Kincardineshire I know of an area where, I am sure, there is room for a 20,000-acre afforestation scheme, on heath ground, not worth more than 6d. per acre for sheep grazing. I am not posing as an alarmist, but we are not only reaching, but have reached, a crisis which gives cause for serious anxiety. Something must be done, and done quickly, as the evil cannot be remedied in a year or two. If our large landed proprietors could only be made to realise the actual position that must inevitably arise if we take no steps to avert the calamity which is bound to come, they would lay the foundation of wealth, if not for themselves, at any rate for their successors.

Value of Home-grown Timber.

Coming to deal with the value of home-grown timber, the lecturer said that the foreign timber man will tell you that Scots fir cannot now be grown either in size or quality to compare with his importations of red wood, or even with the Scots fir our ancestors used. But these critics almost invariably make an exception of some particular wood of great age in their own district. The Ross-shire man excepts some grand old Lovat or Balnagowan perhaps; the Nairnshire man must, of course, except the magnificent old woods near there, where there are still thousands of firs, which for size and quality are equal to the best foreign importation. The late Provost Mann, of Nairn, offered £13,000 cash down, for some 6,000 of those trees. Then, if you turn to Inverness-shire the critic there excepts the natural-grown forests of Rothiemurchus and Abernethy, skeletons now, however, and he may well do so, for in the latter part of the eighteenth century these were the sources of regular shipments to the Thames for shipbuilding purposes. How does the critic of Scots firs, as grown now, account for all these exceptions, his Ballochbuies, etc.? The fact is that if we could imagine Scotland as it might have been now if afforestation had been ordained 150 years ago, there would now be no critics to argue with, for all round the hillsides of every county we would have had fine timber of every description, and varying in size and quality, according to the soil and climate, and in age from the veteran plantation of 150 years to the seedlings, newly transplanted from the great national or local nurseries. Our German friends, who can give us points in forestry, have made a concession in favour of our soil, and frankly admit that for timber cultivation it is second to none. Seeing then that we have the soil, the men, and the plant, the State ought at once to commence some great national scheme of afforestation.

Rearing of Forest Trees.

After a dip into the future, and a reference to what the condition of Scotland will be 100 years hence, after a great afforestation scheme, and touching on the great value of timber for paper-making, Mr. Munro proceeded to deal with the rearing of forest plants. Too little attention, he said, had been given to a very vital question relative to afforestation—namely, the rearing and supply of forest plants. Apart from the fact that, in many cases, only a superficial knowledge is possessed as to the care and selection of plants, still more unfortunate is the way plants are sometimes dumped into unsuitable soil, and he thought it would be a feasible plan for the state to supply proprietors with trustworthy plants from State nurseries at cost prices, and, in some cases, if desired, a practical man could be sent to advise as to soils, and to give practical instruction in planting where it was required. He had in his mind's eye a case in point, where 1,200 acres were planted indiscriminately. The result was that half had to be cut down and burned about fifteen years ago, and the remainder, now thirty years old, is practically useless. On small estates with nurseries he had occasionally been struck by the haphazard manner in which planting was conducted, little or no regard being given to either soil or exposure; and, in valuing woods, had often felt that if due regard had been paid to the planting of the proper trees adapted to the particular soil, a far better result would have been attained financially.

The trees he would select for planting are the larch, Scots fir, spruce, and Douglas fir. The larch is one of the best trees possible, and produces a wood of the finest quality for a generality of purposes—sleepers, boxwood, staves, heading, etc. Spruce, which has been considerably neglected by most of our foresters and proprietors, can be grown equal to the best Baltic product. He was however, glad to say that this fine timber is now being recognised at its true value. In his opinion, spruce planted in suitable soil and surroundings would give far better returns than any other wood he knew, and, as an instance, he stated that there is an area of this fine wood not many miles distant growing about 550 to the acre, and 50 years of age. The value is £110 per acre as it stands. With regard to Douglas fir, he frankly admitted that he had not much experience in its manufacture, but believed it will be found to be very useful, and, in many instances, will take the place of Scots fir for the manufacture of boxwood, etc. Many people are under the impression that it will ultimately take the place of larch, but such was not his opinion, as the principal use to which larch is put—namely, pole and pit wood—renders Douglas fir unsuitable owing to its shape. That trees can be grown in many districts up to an altitude of 1,400 feet above sea level with success has been amply demonstrated. He mentioned that he examined lately some Scots fir, larch, and spruce, at Auchernach, Strathdon, measuring from 6 feet 9 inches in circumference five feet from the root. He knew that great trouble is being experinced with disease in the larch plants. The reason why some larch plantations have not been a success, he thought arises from the fact that not enough care is exercised in the selection of the seed, which, in many cases, is taken indiscriminately by the cone gatherers. If further proof is necessary that we can grow the trees, he briefly referred to the fine specimens of grand old trees still existent at Monymusk, Breadalbane, Ballochbuie, Gardon Castle, Finzean, etc. Those who visited Monymusk in the summer, through the courtesy of Sir Arthur Grant, had ample opportunity of seeing the far-famed larches in Paradise, giants ranging from 175 to 416 cubic feet, averaging for twelve trees 268 cubic feet.

State and Afforestation.

Coming then to deal with the State and afforestation, Mr. Munro said that if the State is particularly anxious to encourage afforestation, they certainly employ peculiar methods. A case which came under his own notice may very well be quoted. On an estate on Donside, about 30 miles from a railway station, 19 acres of land were planted up, which the assessor promptly assessed at £12. The proprietor had every intention of planting up from two to three hundred acres—as a matter of fact the plants were purchased—but this encouragement on the part of the State effectually precluded any possibility of this being done. Another hardship under which proprietors suffer is in connection with the roads. They may plant up trees and be taxed from anything up to 100 years. As the farmer expects to find the roads in his district strong enough to bear the transport of his produce, so should the forester have the same facilities in taking his timber to market. The result of this negligence is that the expense of haulage is considerably increased, and hence the proprietor has to accept a reduced price.

Squirrels.

Dealing with the vermin foresters have to contend with, Mr. Munro declared that if afforestation is to be a success, a clean sweep all over Scotland must be made of vermin in the woods. It is a curious thing to consider the fascination of the squirrel, but the charm, it seems, is all in the big curly tail. Had squirrels been without their big, pretty tail, they would have been as ugly as their relative, the weasel, and would have been exterminated long ago. Even the laird sometimes forgives their depredations when admiring their gambols, for we are all apt to forgive the sins of beauty. He knew one proprietor, in fact, who rigidly preserved them. Nobody can compute how many hundreds of thousands of pounds the squirrel has cost Scotland. We are supposed to be a practical people, and yet our lairds have never until recently in the far north thought of putting their heads together and making an effort to utterly root out the vermin. But without combination the thing is impossible. Recently he was engaged valuing two woods, each of several hundred acres in extent, and there was not a Scots fir in these woods which had not been more or less destroyed by squirrels. It is pure guesswork, of course, but, considering the age and present small dimensions of the trees, and other circumstances of these particular woods, he believed the damage done by the squirrel must have amounted to more than the present value of the woods—to perhaps as much as £15 per acre, or, say, £9,000 on 600 acres.

Increased Employment.

The lecturer concluded his most interesting and practical paper by pointing out what afforestation would mean in the way of employment. Let us suppose, he said, the possibility occurred during the next few years to plant even ten millions out of the twenty practically waste acres of Britain, this would mean employment for about 100,000 men as foresters and labourers alone, while at least as many more would be employed in subsidiary work. Allowing four dependents to each man, this would mean that a living on the land would be given to about a million of human beings, who otherwise would go to swell the already overcrowded towns. In addition to those actually employed in forestry, there would also be employed the necessary labour for haulage, loading, and sawing, to say nothing of other industries, such as building, shopkeeping, schooling, etc., which would follow, and it may be taken that more men would be employed by the conversion of the timber than by its growth. Think of the vast number of saddlers, blacksmiths, and engineers that would find employment, to say nothing of those engaged in the saw-making industry and the manufacturers of belting. Railway companies would also be greatly benefited by the additional traffic, and our farmers and smallholders would find a ready market for their produce. Surely such a prospect should appeal to the nation at large as a highly desirable thing to attain to. It is a national question, and should not be mixed up with any political party. A further advantage lies in the fact that forestry gives employment at a time of the year—late autumn and winter when country work generally is scarce, and thus, by keeping men fully employed all the year round, there would be a great inducement for them to remain on the land.

The lecture was illustrated by a capital series of lantern and cinematograph views, which greatly added to its enjoyment. On the motion of the President, a most cordial and enthusiastic vote of thanks was awarded Mr. Munro for his admirable and thoroughly practical paper.

OBITUARY.

MRS. MARTIN JOHN SUTTON.

We regret to announce that Mrs. Martin J. Sutton, wife of the senior partner of Messrs. Sutton and Sons, Reading, died on February 2. The funeral took place at St. Andrew's Church, Sonning, on Monday, February 6, amid abundant tokens of the very high esteem in which this gracious and kind-hearted lady was held throughout the district. The little church was crowded with mourners and sympathisers, and almost as many people were in the churchyard to pay their respect to the memory of Mrs. Sutton. All grades of society were present, noble, gentle, and simple; the Mayors of Reading and Henley attended with ministers of the various religious bodies of these towns, heads of Messrs. Sutton and Sons' departments, and representatives of practically every philanthropic movement in the district. The members of the Sutton family were almost all present at the church and the graveside. A noble palm-leaf from Mr. Martin J. Sutton was the only tribute on the coffin, but the floral offerings sent were both numerous and beautiful, and the grave was lined with ivy, and white and salmon-coloured cyclamens. Mrs. Sutton was 57 years of age, and passed away on the thirty-sixth anniversary of her wedding day. We wish to add our sympathy to that already expressed so widely with the bereaved husband and family.

GREENHOUSE MANAGEMENT.—THE AMATEUR'S GREENHOUSE, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

NATIONAL SWEET PEA SOCIETY.

GREAT EXHIBITION AT ROYAL HORTICULTURAL HALL, WESTMINSTER, July 11 and 12.

Now is the best time to join the Society. Minimum Annual Subscription, 5s. Schedules on application. "Sweet Pea Annual" free to Members; 2s. post free to non-members.

CHARLES H. CURTIS, Hon. Sec.
Adelaide Road, Brentford, Middx.

STRATFORD-ON-AVON FIFTH ANNUAL FLOWER SHOW.
On BANK HOLIDAY, August 7th, 1911.
OPEN TO ALL.
MARIE CORELLI CHALLENGE CUP,
Value 25 guineas,
With Gold, Silver, and Bronze Medals,
For Best Collection of Cut Flowers and Fruit to occupy a stage 12ft. by 4ft.
NUMEROUS OTHER PRIZES.
Schedules to be had of Mr. J. HOWE, Hon. Secretary, Stratford-on-Avon.

EXHIBITIONS AND MEETINGS.

National Chrysanthemum Society.

The annual general meeting of this old and useful society was held at Carr's Restaurant on Monday evening, February 6. There was an excellent attendance, under the presidency of Sir Albert Rollit. After the notice of the meeting, Mr. C. Harman Payne informed the members that Sir Albert had recently had conferred upon him a Knight Commandership of the Order of St. Olaf of Norway. Considerable applause greeted this announcement, and Sir Albert acknowledged the greeting, and said the Order had been conferred upon him for services rendered through the Norwegian Chamber of Commerce.

The minutes of the previous annual general meeting having been read and confirmed, the President moved the adoption of the report and balance-sheet (of which we give an abridgement). He spoke highly of the work of the committee, its chairman, and the secretary, and said the report was a statement which all members should feel extremely gratified with. He was proud to be president, and would always endeavour to do his best to further the society's interests. He thought each member should take a close and personal interest in the society. He referred to the society's friendly associations with other societies at home and abroad. Sir Albert paid a high tribute to the excellent and painstaking work of the Floral Committee, and also pointed out the great value of the conferences to members, and to the chrysanthemum world. He also asked that the members of the society would do all that lay in their power, sparing no effort to make the great International Exhibition of 1912 a huge success. Referring to finance, Sir Albert said the society now had a profound air of respectability in that it had finished the year without a liability, with a balance at the bank, and a reserve fund of £50. The motion was seconded by Mr. Thos. Bevan, and carried unanimously.

REPORT OF THE COMMITTEE FOR 1910.

The Executive Committee have pleasure in submitting to the members their annual report for the year 1910.

Sir Albert Rollit, D.C.L., LL.D., was re-elected president for the third year in succession at the annual general meeting held in February last. During the past year the president has advanced the cause of our society in many directions, and your committee desire to place on record their keen appreciation of his continued activities in keeping the name and work of the National Chrysanthemum Society constantly before the public, both at home and abroad.

The Early Chrysanthemum Show was held at the Crystal Palace on October 5 and 6, and the Grand Autumn Exhibition, also at the Crystal Palace, on November 2, 3, and 4. By common consent both shows marked a great advance on previous years, and in the opinion of many experts the November Show was in point of quality the finest which has ever been held under this society's auspices.

Having in mind the great success which attended the proceedings at the Society's Conference in 1909, your committee arranged for a further conference in 1910, which was held at Essex Hall on December 5. It was decided that the papers to be read should deal with various aspects of the culture and exhibition of large chrysanthemum blooms. The programme finally arranged was as follows: "The Culture of Japanese Chrysanthemums for Exhibition," by Mr. Norman Davis; "The Culture of Incurved Chrysanthemums for Exhibition," by Mr. W. Higgs; "Methods of Exhibiting Japanese and Incurved Chrysanthemums," by Mr. H. J. Jones; "The Use of Large Blooms in Floral Decoration," by Mr. R. F. Felton; "Late-Struck Japanese Chrysanthemums for Exhibition," by Mr. Thomas Stevenson.

The President opened the proceedings at the afternoon session, the chair at the evening session being taken by Mr. T. Bevan. Some seventy members were present at the afternoon and evening sessions, and the whole of the papers and discussions thereon have since appeared in the various organs of the horticultural Press.

The Floral Committee met at Essex Hall and the Crystal Palace on eight occasions for the consideration of new varieties. Two hundred and forty-two novelties were submitted to them, and of these 54 were awarded first-class certificates, 22 were commended, and one received the special award for colour instituted in 1909. Votes of thanks were also passed to Mr. J. H. Witty and Messrs. W. Wells and Co., Lim., for collections of early varieties at the September meeting. The sections to which certificates were awarded were as follows: Decorative, 20; Japanese, 19; Singles, 12; Incurved, 2; Semi-double Decorative, 1. The full list of all the new varieties which received awards will appear in the schedule as heretofore. Difficulties have arisen on more than one occasion during the past season with regard to the sections in which novelties should be classified, and the Floral Committee are now taking into consideration the whole question of classification with a view to revising the list of sections, if thought necessary, and defining the characteristics of the various sections with due regard to the advancement in culture which has been made since the society's catalogue was issued.

In the early part of 1910 the Floral Committee decided to hold trials of single varieties, with a view to drawing up a list of "too-much-alike" varieties, and also of "pointing" the best singles in each shade of colour. They approached various growers for assistance in this direction, and it was ultimately arranged that the trials should be divided as follows: September and October varieties, by Messrs. W. Wells and Co., Lim., Merstham; November varieties, by Messrs. H. J. Jones, Lim., of Hither Green and Keston; December varieties, by Messrs. H. Cannell and Son, of Swanley.

Your committee have again the satisfaction to report that the whole of the ordinary liabilities of the society were paid before the books were closed on December 31, 1910. In the early part of the year a sum of £50 was transferred from current account to reserve fund account; and it will be observed from the accounts that at the close of the year a sum of £50 8s. 8d. stood to the credit of the society on current account at the bank. There are other sundry small amounts due for medals and advertisements, and these together with the various properties at the Crystal Palace, and the money at the bank, make the total assets on December 31 last £121 12s. 9d.

In connection with the International Chrysanthemum Show, which was held at Paris in November last, the President of the society and Mr. T. Bevan and Mr. C. Harman Payne were appointed members of the jury. They attended the show as officials of the National Chrysanthemum Society of England and were treated with the cordial hospitality which is typical of our French neighbours on these occasions. Whilst in Paris the President of the society took the opportunity of presenting this society's medals to the following three gentlemen whose names are household words in the horticultural world of France, viz.: Mons. Viger, president of the National Horticultural Society of France; Mons. A. Truffaut, premier vice-president of the National Horticultural Society of France; and Mons. Maxime de la Rocheterie, president of the French Chrysanthemum Society.

Your committee have had under consideration correspondence from the committee in charge of the arrangements for the International Exhibition to be held in London in May, 1912. The season of the year at which the exhibition will be held will prevent anything like a large display of chrysanthemums, but it is hoped that the "Autumn Queen" will be represented in the schedule, and your committee have offered to give National Chrysanthemum Society medals to be awarded to exhibits of chrysanthemums at the exhibition.

It is interesting to note from the accounts that the subscription income for 1910 shows an increase as compared with the year 1909. Although the strength of a society which has over a hundred affiliated societies on its register must not be judged by the number on the membership roll, still your committee feel that a determined effort upon the part of all existing members to bring forward new supporters would result in a large influx of new members, and it is hoped that this effort will be made during 1911.

The management of the Crystal Palace being still in the hands of a Receiver, acting under the direction of the High Court, it has not yet been possible to complete the arrangements for the holding of the 1911 shows. Negotiations are, however, now proceeding, and the dates for the shows have been provisionally fixed as follows: October 4 and 5, November 1, 2, and 3.

FINANCIAL STATEMENT FOR 1910.

A vote of thanks was accorded the auditors, Messrs. W. H. M. Dean and F. Grice Hackney. On the motion of Messrs. T. Bevan and Mr. D. B. Crane, Sir Albert Rollit was unanimously and heartily re-elected president, an honour to which Sir Albert responded. Mr. John Green was heartily re-elected treasurer, on the motion of Messrs. Ballantine and J. Witty. The President moved, and Mr. Moorman seconded Mr. T. Bevan's re-election as chairman of committee, and this appointment, as well as that of Mr. E. F. Hawes, as vice-chairman, were carried unanimously. Mr. C. Harman Payne was once again re-elected foreign corresponding secretary.

Mr. R. A. Witty was very heartily re-elected as secretary, and his services were warmly eulogised; his sponsors were Messrs. Bevan and J. Green, and several other members spoke in kindly praise, and Mr. R. A. Witty pleasantly responded. Messrs. F. G. Hackney and A. H. Stevens were appointed auditors for 1911, on the motion of Messrs. C. H. Curtis and W. Howe.

On the motion of the President, Mons. Viger, Mons. Truffaut, Mons. Maxime de la Rocheterie, Mr. J. H. Witty, and Mr. D. B. Crane were elected Honorary Fellows of the society, the two latter to receive suitably-engraved medals as mementos of the honour. Mons. Louis Gentil, Curator of the Brussels Botanic Gardens, was elected a corresponding member.

Two of the twelve retiring members of committee were not eligible for re-election, as they had failed to make the requisite number of attendances during their past three years of office. Messrs. Frogbrook and J. Kirkwood were nominated to fill the vacancies, and, as there were no further nominations, there was no need for an election, consequently the President declared Messrs. R. Ballantine, W. Cassidy, P. A. Cragg, C. H. Curtis, D. B. Crane, A. J. Foster, W. Newton, G. Prickett, A. W. Seabrook, Frogbrook, and J. Kirkwood elected for the next three years.

A vote of thanks was heartily accorded the president, which Sir Albert acknowledged in a delightfully humorous fashion. The proceedings terminated at an early hour.

Royal Scottish Arboricultural Society.

The annual business meeting of this society was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 3rd inst. Sir John Stirling Maxwell, Bart., of Pollok, the president, was in the chair, and there was an attendance of about fifty members. The report by the Council stated that there was a net increase in the membership of 17, the total now standing at 1,369. The abstract of the accounts showed a surplus of revenue of £129, and that the funds now amounted to £2,200. Mr. A. D. Richardson criticised the last volume of the transactions, and made some suggestions as to ways in which they might be improved.

In his address, the Chairman referred to the need for a Government Forestry Department, without which a great subject like forestry could not be dealt with effectively. All their difficulties sprang from the fact that they had been unable to persuade the Government that this was necessary. The society had, however, taken up the matter of a sample survey of land that could be afforested, and with the help of Lord Lovat and Captain Stirling, they had obtained results far beyond their expectations. Under the Development Act, money had been devoted by Parliament for forestry purposes, but, as there was no Department of Forestry the Development Commissioners had to be approached through the Education Department for Scotland. The assistance of the society had been asked for, but the Council felt that they could not give it unless some definite assurance were given that, when the grant for the development of forestry was given it would be entrusted to men who were competent to administer it, and that they had a clear assurance that the survey which the society had commenced would be taken up by the Government at once. The object of the society in commencing the survey was to see an advance made in afforestation in Scotland, and he thought they would be fools indeed if at this critical moment they gave their assistance unless they were sure that the policy to be pursued was to be effective. Without such assurance, it would be much better, however unwilling they might be to do so, to relinquish the rôle of willing helpers, and take up that of formidable critics.

Lord Lovat made a statement regarding the sample survey, from which it was learned that 60,000 acres would be capable of afforestation in the Loch Ness Valley.

The convener of the Excursion Committee reported that the excursion, which is to be held in June, would this year be to the Border districts. It was also reported that the society would have an exhibit, free space for which had been granted, at the Scottish Exhibition in Glasgow this year.

Sir John Stirling Maxwell was re-elected president for 1911, and Dr. A. W. Borthwick and Mr. Sydney Gammell, of Drumtochty, were elected to the vacant vice-presidencies.

Mr. A. T. Gillanders, F.E.S., forester, Alnwick Castle, author of "Forest Entomology," was elected an hon. member.

Mr. Wm. Dawson, M.A., B.Sc., lecturer on "Forestry," Marischal College, Aberdeen, afterwards delivered a lecture on "The State and Private Woodlands."

Aberdeen Chrysanthemum Society.

The annual meeting of this society was held in the Young Men's Christian Institute, Aberdeen, on Saturday evening, 4th inst. Mr. Alexander M. Cocker, vice-chairman, presided, and there was a good attendance.

Mr. M. H. Sinclair, the secretary, submitted the annual report, which stated that the society's annual fête was held on November 25 and 26 last, and was attended with a fair measure of success. The weather on the opening day was most inclement and affected the attendance very materially, thereby lessening the gate money. The display of cut blooms was most excellent, the decorative and single chrysanthemums being specially good, and quite the leading feature of the show. Pot plants were better than any shown for several years, while the vegetable and fruit sections were also of much excellence, as was the section devoted to floral art. The financial result is not so good as might have been desired, although somewhat better than last year's. The accounts show a loss on the year's working of £27 15s. 3d., attributable to a variety of causes, but, given more favourable weather next year, the financial results should be more satisfactory. The report also tendered the cordial thanks of the society to the Right Hon. Robert Farquharson, of Finzean, for his genial and willing service in opening the fête, and to all who had helped in any way to further the interests of the society.

The Chairman, in a neat and genial speech,

Eckford's
Giant SWEET PEAS

The Finest Blooms

that blossom on the Sweet Pea Plant are grown from Eckford's famous seeds. Eckford, the Sweet Pea Specialist, supplies only seeds that are bound to give good results. Eckford's seeds flower brilliantly, give brighter colours, longer stems, larger flowers, and succeed even in the most difficult soils

ECKFORD'S are the largest retailers of Sweet Peas in the world, and do not supply the trade.

Villa (E) Collection.
12 Extra varieties, suitable for exhibition, 25 seeds of each, **1/6,** post free for cash.

A specially written Booklet on Sweet Pea Growing given with every order.

For full list of Special Novelties see next week's issue.

FREE. Send a postcard to-day for large Illustrated and Coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

HENRY ECKFORD, F.R.H.S.
(Dept. 221), Wem, Shropshire.

moved the adoption of the report and accounts. No doubt, he said, they were a little down from the results of 1909, but there were several reasons for that. They must not forget that Aberdeen had a great number of entertainments now, which were bound to detract a little from what they as a society placed before the public, but he hoped, and felt confident, they would be able to make up the leeway this year. Mr. J. Smith seconded, and the motion was carried unanimously.

Lord Provost Wilson was re-elected hon. president. Miss Chalmers, of Ardbeck, and Dr. Farquharson, of Finzean, were added to the list of hon. presidents. Mr. W. J. Middleton was re-elected chairman, and Mr. A. M. Cocker was most cordially reappointed to the post he so worthily holds, of vice-chairman. A committee of twenty was also elected, and Mr. M. H. Sinclair was also unanimously re-elected secretary. The annual show was fixed for November 24 and 25 next, in the Music Hall Buildings.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, January 31.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Dr. A. B. Rendle, Messrs. J. Fraser, A. D. Michael, J. W. Odell, A. Worsley, E. M. Holmes, W. C. Worsdell, W. Fawcett, A. W. Sutton, and F. J. Chittenden (hon. sec.).

CUTTING THE COMMON REED. — A question was raised concerning whether the best practice in cutting the Common Reed (Phragmites communis) was to cut annually or triennially. It was pointed out that in the Norfolk Broads, where this crop is a very valuable one, the practice where the best reeds were grown was to cut annually, for if they were left longer they became very brittle, and otherwise deteriorated, making the sample when cut very irregular.

CEDAR CONES.—Mr. J. Fraser showed cones of Cedrus Libanii and C. Deodara. These cones had been collected in August, when they were both green. The cone of C. Libanii was comparatively small, it became brown a month after gathering, and was hollow at the apex. That of C. Deodara was heavier and full of resin; it became brown only after two months; the apex of the cone was pointed, and each scale, unlike that of C. Libanii, was ribbed near the apex.

DOUBLE RICHARDIA AFRICANA. — Some large and well-marked examples of this well-known phenomenon were sent from Trowbridge.

FASCIATION IN MARSDENIA. — Mr. Bowles showed a fasciated stem of Marsdenia erecta from the Rev. Canon Ellacombe, at Bitton. It is rare for an example of fasciation in a plant belonging to the Asclepiadaceæ to be shown before the committee. Mr. Worsdell remarked that he had observed the phenomenon in a Stapelia in South Africa.

WHITE CROCUS IMPERATII.—Mr. A. E Bowles drew attention to a white form of Crocus imperatii, which had occurred among some imported corms, and was exhibited by Messrs. Barr. The flower showed none of the barring on the outside of the perianth segments usual in this species.

Edinburgh Market Gardeners' Association.

The annual dinner of the association was held in the Royal British Hotel, Princes Street, Edinburgh, on the 3rd inst., when, under the chairmanship of the genial president of the association, Mr. David King, Osborne Nursery, Murrayfield, about fifty of the members and their friends spent a most enjoyable evening. In the course of the evening one of the members, Mr. Morrison, market gardener, Beggarsbush, Musselburgh, was presented with a handsome roll-top desk. Mr. Morrison migrates south to the Birmingham district, and the best wishes of his confrères in the North go with him. The proceedings were much enlivened by songs rendered by some of the younger members.

Lee, Blackheath, and Lewisham Horticultural Society.

At a meeting held on January 27 at the Church Street Schools, a lecture was given by Mr. R. C. Pullen on "Chrysanthemums." He advised all growers to make a good start by selecting cuttings from those plants that had borne the best type of flowers only, but he pointed out the fact that plants which had borne flowers of good quality were often shy in producing cuttings, whilst the plants that had borne inferior blooms had a tendency to throw up strong, vigorous cuttings in abundance. Gardeners anxious to start propagating their stock were very apt to take those vigorous cuttings, irrespective of what the flowers on that particular plant had been. Young plants should have plenty of air when weather conditions were favourable during the dull months, in order to produce that short, sturdy growth which is the foundation of a healthy, vigorous plant. Mr. Pullen advised allowing a little room between the pots in order to enable the air to properly circulate. The potting soil should be prepared several weeks beforehand, in order that the various ingredients might become thoroughly incorporated. Mortar rubble, he considered preferable to sand, as it acts mechanically and chemically. After describing the various details of summer treatment, taking of buds, etc. (laying especial emphasis on the necessity of paying strict attention to detail, in order to ensure success), Mr. Pullen went on to show how many growers made a great mistake after housing their plants, by leaving all ventilators and doors open, ostensibly to give plenty of air, but in reality causing a sharp draught, this was a prolific cause of mildew, and subsequent damping. He advised a light shading if the sun was very strong, as much damage is sometimes done to the plants by after-housing, because, having been outside all the summer, they were not used to strong sunshine through the glass. Mr. Pullen gave a fine selection of the best varieties for various purposes, and at the close of the lecture was accorded a hearty vote of thanks by an appreciative audience.

On February 24 a lecture will be given by Mr. G. E. Dibley, F.G.S., on "The Fertilisation of Flowering and so-called Non-flowering Plants."

Beckenham Horticultural Society.

On Friday, February 3, Mr. Montague C. Allwood, Bush Hill Park, lectured to the above society on "The Perpetual Carnation," R. Murray Hyslop, J.P., presiding. Mr. Allwood's visit had been looked forward to with more than ordinary interest, and the meeting room at the Church House was packed, an evident compliment to the lecturer, who thoroughly held his audience for upwards of an hour in a style peculiarly his own. After a few preliminary remarks on the history of the perpetual carnation, and the American firms and growers, the culture as practised in this country was detailed. Those present were advised that before one can grow carnations satisfactorily good stock must be secured. Always select the very best plants for propagating purposes. The lecturer brought with him material to illustrate the best types of cuttings, showing which to take, and why and how to do so, both as piping and cutting. Sand without any addition is, in Mr. Allwood's opinion, the very best medium in which to root the cuttings. They should not be allowed to grow in the sand, but be potted off into 2in. pots as soon as rooted. A bottom heat of 55 deg. to 60 deg., and top heat 10 deg. less, is desirable. December to March inclusive are the best months for propagation. Stopping the young plants should be done when five or six good joints can be left, and may be practised up to July, only stopping one shoot on a plant at a time. Plunging the pots in ashes when outside was advised to keep the roots cool. House the plants in August, and 45 deg. to 50 deg. at night by fire is the limit, with the usual rise in the day. Always plenty of air. Shade is not required at any time for the plants, but to preserve the blooms it is desirable.

A capital discussion followed. Many questions were asked, and the information sought was given by the lecturer in a pleasant and instructive way. A hearty vote of thanks was accorded Mr. Allwood, who, in reply, said he hoped to pay another visit.

Bristol Gardeners' Association.

The usual fortnightly meeting was held on January 26, at St. John's Parish Rooms, when Mr. Hayball presided over a good attendance.

In order to encourage the young gardeners, prizes were offered for the best papers on "Watering." Six young men entered the competition, and gave highly creditable essays, the composition and delivery of which came as a pleasant surprise to all. Messrs. Ayres, Theday, and Woodward were nominated to adjudicate, and awarded the first, second, and third prizes to Messrs. Extence, Perry, and Sweeting respectively. It was suggested that, with such promising young men among its members, the society need have no fears for the future.

For two table plants, Messrs. Jennings, Grieve, and Bastin won in the order given. In the point competition Mr. Springham received seven points for cyclamen and apples; Mr. Woodward four for a Brasso-cattleya; and Mr. Scott two for a cypripedium.

National Amateur Gardeners' Association.

FEBRUARY 7.

At a Bohemian concert held at the Holborn Restaurant on Tuesday evening, the prizes won by the members during last year were presented. An interesting feature of the proceedings was the presentation of an illuminated address to Mr. T. W. Sanders, F.L.S., who has occupied the position of president since the foundation of the society in 1890. It was at Mr. Sanders' suggestion that the society was formed.

Woolton Chrysanthemum Society.

This society held its twelfth annual meeting at the Mechanics' Institute on February 1, Mr. A. G. Dent in the chair. The report for the year referred to the success of Mr. George Eaton, gardener to W. Tod, Esq., as the winner of two challenge vases for twenty-four Japanese blooms, and one for nine vases of single varieties, the latter being possibly the best yet staged in the fine competitions of the society. Happily, the loss to the society of three challenge cups has been made good by the generous gifts of Mrs. Barr, Mrs. Dent, and W. Tod, Esq., so that the keen interest in the future competitions will be sustained. The balance-sheet showed cash in the bank of £36 2s. 11d., a slight margin in favour of the year's work. Mr. A. G. Dent, hon. treasurer; Mr. R. G. Waterman, assistant hon. treasurer; and Mr. W. D. Skinner, hon. secretary, were re-elected in their respective positions.

Liverpool Horticultural Association.

This society held its thirty-second annual meeting recently in the Common Hall, Mr. W. Mercer in the chair. The report stated that three shows had been held during the year, with satisfactory results so far as the exhibits were concerned, although the attendance in each case was only moderate. The balance-sheet gave the subscriptions as £292 10s.; admissions to the spring, rose and sweet pea, and autumn shows, £143 4s. 11d.; special prizes and entry fees, £50 17s. The prize money totalled £220 3s. 6d., leaving a balance in hand of £172 10s. 8d., or a loss on the year's working of £47 17s. 10d. Three shows will be held during the current year. Spring, rose and sweet pea, and chrysanthemums, fruit, etc. The following officers were re-elected: Chairman, Mr. W. Mercer; hon. treasurer, Mr. W. F. Rogers; sub.-treasurer, Mr. G. Blackmore; secretary, Mr. H. Sadler, 31, North John Street, Liverpool

THE LANGUAGE OF FLOWERS
"Feed us, we pray you, with

ANSWERS TO CORRESPONDENTS.

ROSES.—A. L., Knutsford: The particular kind of information you require is to be found is the National Rose Society's "Rose Annual for 1910." This may be obtained post free for 2s. 6d. from Mr. Edward Mawley, Rosebank, Berkhamsted.

SWEET PEAS.—J. E. C., Chesterfield: You will find "Sweet Peas and their Cultivation" a most useful book for your purpose. It can be obtained post free for 1s. 2d. (or 1s. 8d. cloth) from the Gardeners' Magazine office, 148 149, Aldersgate Street, London. E.C.

BUD DROPPING IN BEGONIA GLOIRE DE SCEAUX.—J. C., Leeds: Bud dropping is generally due to one of three causes; lack of moisture, over-watering, and bad light. If you think neither of these is the cause in your case, please let us have a few particulars concerning the conditions under which the plants are grown during winter.

EMILE D'HEYST PEAR.—H. P., Lincoln: From many growers and widely-separated districts we have received information as to the curious effect of the past season upon the ripening of pears, and we can quite understand that you had Emile d'Heyst in good condition at Christmas time, although this is generally listed as an October and November pear. On the other hand, some varieties came into use earlier than usual. In Middlesex we this week helped to finish the last few fruits of a small crop of Beurre Rance, a pear that Dr. Hogg says is in use from February till May. Seasons, soils, and aspects have a very decided influence upon the ripening of pears; more so than upon apples.

FUNGUS ON GRAPES. — W. H. P., Winscombe: We are much obliged to you for the further information, and much regret that its delay was due to illness. So far as we are able to judge, the whole of the cultural details are excellent, and the only advice we can offer here is that the front ventilators should be arranged only to open outwards from the bottom. From the evidence submitted, we are inclined to believe that the attack is due to a fungus known as Sclerotinia Fuckeliana, which sometimes appears in the earlier stages of growth, but which also affects growths and fruit and leaves. Spraying with potassium sulphide checks the disease. If all the affected portions of leaf, growth, and fruit are removed and burned as soon as the attack is seen, the trouble may be overcome with the aid of the potassium sulphide. Use the latter as a preventive, and directly signs of an attack are noticed this year send a sample specimen for investigation.

TREES AGAINST A NORTH WALL.—F. V. M., Barnet: The wistaria loves sunshine, and, therefore, would not be a success on a wall having a north aspect. The Victoria plum would be moderately successful, and much would depend upon the light obtainable, and the shelter from east and north winds. You would find Morello cherries, gooseberries, and red currants do very well against a north wall, and here they would provide late and useful crops of fruit.

CUCUMBER CULTURE.—G. H., Liverpool: Sow the seeds singly in small pots, in light soil, water them in, and then place them in the stove or warm pit. Plunge the pots, and give no more water than is really necessary until germination takes place. Directly the third leaf has formed pot each plant in a large 48 or a 32-sized pot, and still keep in the warm house, well up to the light. In a light pit or house make everything perfectly clean, and limewash the walls; if you have command of good oak leaves use these to make up a bed two feet thick where the cucumbers are to grow. On this put a small quantity of good loam mixed with road grit and leaf-soil, and let this become warm before planting the cucumbers in it. Allow two feet between the plants, and when plants and soil have settled down tie the cucumbers to wires strained about twelve inches from the glass. Syringe freely on all favourable occasions, see that there is no lack of moisture, and when the roots show through the soil add a small dressing of rich material. When in full bearing give liquid manure freely. The temperature for cucumbers should not fall below 60 degrees, and under the action of sunshine it may well rise to 100 degrees or more without harm, so long as the paths and walls are thoroughly and frequently damped down. Unless needed for seed purposes there is no need to fertilise the flowers. Superfluous growth should be regularly removed, but new growths should be tied in to take the place of those that have been fruiting for some time.

APPLE WINTER PEACH.—E. F., Weston-super-Mare: This is a useful late-keeping culinary apple, but it is not now regarded as a foremost variety. The fruits are of medium size, and ribbed; skin, creamy-yellow and brightly polished. The white flesh is juicy, and has a brisk acidity. Winter Peach is an apple rarely catalogued by the leading nurserymen.

APPLE GASCOIGNE'S SCARLET.—E. F., Weston-super-Mare: This is a very fine and useful apple, a free grower, and fine cropper. Its fruits are large, and very handsome, and good alike for dessert or kitchen use. It was raised in Kent, and is one of the most beautiful apples we have. The growth is spreading, and has a slight inclination to weep. Grown on the Paradise stock this handsome apple rarely fails to yield fruit. Many thanks for your congratulatory letter.

BOSTON PUBLIC PARKS.—Parkite, S. Wales: So far as we are aware the report of the Board of Commissioners of the Boston Parks is not offered for sale, but printed for the use of the Department. The thirty-fifth report runs to 57 pages, and is well illustrated. Our American friends are usually kindly disposed in these matters, and no doubt if you wrote to Mr. J. A. Pettigrew, Superintendent of Parks, Boston, Mass, U.S.A., and stated your reason for wishing to possess a copy, you would be supplied, if possible. The report is not priced.

GLADIOLI.—M. S. H., Goole: In the production of fine spikes of these subjects a deep, well-stirred, and moderately rich soil is essential. Plant the early-blooming varieties in the autumn or February, and the Gandavensis and Lemoinei hybrids in March or April, according to the condition of the soil; medium-sized corms are preferable, and unbloomed seedlings are of special value for garden decoration, for they are cheap, and seldom suffer from the disease which is sometimes most destructive. For these reasons we advise amateurs to purchase seedlings of the Gandavensis and Lemoinei hybrids, and to order the finest selection. The strong growing and brilliantly coloured Brenchleyensis should be grown in addition to the seedlings, and planted liberally, according to the space at disposal.

ERICA HYEMALIS.—J. W. H., Liverpool: This fine and popular heath should be grown in peat and sand; the pots must be thoroughly well drained. An ordinary greenhouse temperature will suffice, except in the case of cuttings and quite young stock, when slightly warmer conditions are desirable. Established plants, when growing freely, need free ventilation, and at the end of the summer a cold frame will give sufficient protection, the lights being used only to ward off heavy rains. A cool, moist base on which to stand the pots is desirable, such as one formed of ashes. Plants should be cut back somewhat severely after flowering, and they will not need much ventilation until new growth has begun. Repotting is best done early in February or March, and the soil must be made quite firm. Cuttings of firm young growth taken towards the end of the summer, and placed thickly in well-drained pots, in fine sandy peat, will root well enough if placed under a bell-glass in a close pit or intermediate house. The surface of the cutting bed should be of pure sand. The culture of heaths cannot be successfully managed in smoky town districts; good light and pure air are essential.

NAMES OF PLANTS.

G. B., Hendon.—1, Primula Kewensis; 2, P. Forbesi.

J. W. H., Liverpool.—1, Erica hyemalis; 2, send when in flower.

E. S. A., Chelmsford.—1, Coleus thyrsoideus; 2, Cypripedium Actæus.

C. C. H., Alresford.—1, Acacia dealbata; 2, Leucadendron argenteum; 3, Odontoglossum Wilckeanum; 4, Ficus repens minima.

W. G. G., Chippenham.—1, Pernettya mucronata; 2, Gaultheria Shallon; 3, Pelargonium Clorinda; 4, Hibbertia dentata; 5, Pinus pinea; 6, Diplopappus chrysophylla.

C. S. C., Haslemere.—1. A variety of Cotyledon (Echeveria) secunda; 2, Nephrolepis cordifolia; 3, Adiantum setulosum; 4, a seedling A. cuneatum; 5, not recognised, possibly A. æmulum.

TRADE NOTES.

A Royal Warrant of Appointment has graciously been granted by King George V. to Messrs. Sutton and Sons, of the Royal Seed Establishment, Reading, as seed merchants to his Majesty. Messrs. Sutton were also honoured with Royal Warrants by King Edward VII. and Queen Victoria.

Messrs. Edward Webb and Sons, of Wordsley, Stourbridge, who were seedsmen to their Majesties Queen Victoria and King Edward VII., have received the honour of appointment by Royal Warrant as seedsmen to his Majesty King George V.

His Majesty King George V. has been graciously pleased to grant to Messrs. James Carter and Co., of Raynes Park and High Holborn, a Warrant of Appointment as purveyors of seeds to his Majesty.

Messrs. W. Bull and Sons, of King's Road, Chelsea, have been favoured with the Royal Warrant of Appointment to his Majesty King George V.

Messrs. W. Wood and Son, Lim., have been granted a Royal Warrant as horticultural specialists to his Majesty King George V.

A few evenings since the employees of Messrs. Dickson and Co., the Royal Nurseries, Craigmillar, were entertained by the firm at a social gathering in the Hope Park Hall. The chair was occupied by Mr. William McAra, the oldest member of the firm, and Mr. James Welsh, one of the members of the firm, was present, and gave a hearty welcome to the guests. The festivities commenced with a substantial tea, and this was followed by dancing, which our correspondent states, was continued "until an early hour," presumably of the next day.

FORTHCOMING ENGAGEMENTS.

[The Editor will be greatly obliged if Secretaries of Societies will send schedules and dates of exhibitions to him, at Endsleigh, Priory Park, Kew, Surrey.]

TUESDAY, February 14.—Royal Horticultural Society.—Fruit, Floral, and Orchid Committees meet 12 noon; Annual Meeting, 3 p.m.; Scientific Committee, 4 p.m.

Proposed Daffodil Society.—Meeting of Amateur and Trade Growers at the Horticultural Hall, Vincent Square, in Committee Room No. 3, at the close of R.H.S. Annual Meeting.

Horticultural Club.—Annual Meeting at Hotel Windsor, 5 p.m., and Annual Dinner, at same hotel, 6 p.m.

MONDAY, February 20.—National Chrysanthemum Society; Executive Committee.

WEDNESDAY, February 21.—Irish Gardeners' Association Meeting.

CATALOGUES RECEIVED.

BLACKMORE AND LANGDON, TWERTON HILL, BATH.—Tuberous begonias and carnations are the great specialities of this firm, and their exhibits of the former have charmed many thousands of people during the last few summers. They list choice seeds, special seedlings, named begonias of high quality, begonias for bedding, and begonias for baskets.

GEORGE JACKMAN AND SON, WOKING, SURREY.—This firm issues an excellent catalogue of hardy plants and makes a special feature of rho dendrons, clematis, roses, herbaceous, and A plants. The catalogue contains some excellent i trations of the nursery stock.

THE JOHN INNES HORTICULTURAL INSTITUTION.

APPOINTMENT OF EXHIBITIONERS.

Appointments will shortly be made to five exhibitions established in connection with the above-named Institution, at Merton, Surrey. Of these one has been endowed by the Fruiterers' Company. Applicants must be over 19 years of age, and must have been employed not less than four years in good gardens or nurseries. Exhibitioners will be appointed for two years. They will receive 21s. a week, and will be required to take part in the ordinary work of the garden. They will have opportunities for practising most of the operations of horticulture, but plant-breeding is at present the most prominent feature in the Institution's work.

A form of application, and further particulars may be obtained on application to the DIRECTOR, the John Innes Horticultural Institution, Merton, Surrey.

WM. DUNCAN TUCKER and SONS, Lim., 27, Cannon Street, London, E.C.; Works, Tottenham. Conservatories, Winter Gardens, Vineries, Peach-houses, Portable Buildings, etc. Catalogue gratis.

TO LET.—Facing S.S.W.; on Great Central and Metropolitan Joint Railway, an old fashioned KITCHEN GARDEN, in excellent and good repair, consisting of four acres, all surrounded, and divided up into compartments by high walls covered with well-matured fruit trees of various kinds. In garden are four large vineries, 1 peach house, 5 plant houses (1 new), 8 pits, and numerous spare lights, 1 gardener's cottage (6 roomed), bothy, and sheds. Houses heated with hot water. Adjoining across the road are 5½ acres of orchard, with sheds and cart stable used in connection with the kitchen garden. Excellent well in garden and an additional water supply if required can be obtained by arrangement. Order to view can be obtained with all particulars from the Agent, Shardeloes Estate Office, Amersham.

NOTE OF THE WEEK.

◆

Inherited Sunshine.

When we are admiring the development of the flowers in our gardens, or the wild ones of wood, heath, and the thousand and one other environments which Nature has provided to fit their varied requirements, we are apt to overlook the fact that a large proportion of the vital vigour they now evince is due, not so much to the present conditions of the season, but to those of the previous year. Every fruit grower recognises the fact that it is the sunshine of the previous season which has ripened the wood and rendered it capable of producing flowering and fruiting buds in lieu of mere leaf-producing ones; and every perennial plant profits by that sunshine to lay up a store of root vigour which gives it a fair start when the next growing season arrives. Every bulb or corm of the hyacinth, crocus, tulip, scilla, and any other of the early spring bloomers, thrives or languishes in precise conformity with the amount of sunlight which its foliage of the past year could receive, and under its influence build up at its base a greater or less store of nutriment, the very flower itself being often visible in a cross section, so complete, that all the sunshine of the flowering season is incompetent to add a petal, and can only determine the size of the individual flowers in connection with other favourable or unfavourable factors. What we see, therefore, in our spring radiance and abundance of bloom is really and truly so much sunshine of the previous year inherited by the present one. It is due to the same inherited vigour that so many of the earliest flowers are gifted with the capacity of starting into growth at a time when the conditions of temperature would seem to preclude it, and when indeed the great majority of plants are at rest. For one reason, of course, all such plants have really enjoyed a long rest during the period when the others are active. The tulip bulb, for instance, is the work of late spring sunshine; given but little of this the foliage will make up for its lack by taking longer over its work, but the ideal condition precedent to full-sized vigorous blooms the following year is a period of practical baking in the sun, and in its native habitats in the East we find colonies so exposed that at the ripening season the hand can hardly bear the heat of the soil, the result each season being such compact masses of large and brilliant flowers as to entirely throw into the shade even the splendid tulip effects we see nowadays in our parks and elsewhere.

MR. SILAS COLE.

All this formative work was completed by May or June, and the bulb remains absolutely quiescent and irresponsive to all the blandishments of the summer sun and showers to which the later crowd of flowering plants respond so readily. Late in the autumn, however, they have rested long enough, and despite the ever-lowering temperature, the bottled-up sunshine of the spring begins to animate them, they push forth their roots, and in due course force their spiky foliage to the surface, and eventually display their lovely flowers in all their splendour, as a bequest from the King Sol of a year ago. Since, however, it is the foliage alone which is capable of doing the needful work with the sun's aid, and the quality of this work depends upon such foliage being permitted to complete it, we see the necessity of allowing the foliage of all bulb-forming plants to die completely down before it is cleared away. If removed while still green the bulb, in course of formation will mature, but will be much smaller than it should be, and in all probability will not flower at all the following season, while if exposed to sufficient sun and allowed to run its course throughout, not only will the previous bulb, which has been used up, be replaced by one of equal size, but will, in all probability, be accompanied by others, permitting thus of propagation. It is a curious fact, however, in this connection, that many daffodil bulbs appear hardly to rest at all. Thus it is dangerous to lift them later than August, although their foliage may only have disappeared in July, since already it will be seen that roots have been freely emitted, and to damage these inevitably involves a check. Despite this precocity of root growth, however, no foliage will appear above the soil for nearly six months, and they will not bloom until March, its object, therefore, is rather a puzzle, since without foliage the bulb cannot be increased in size. Tulip bulbs, on the other hand, rest entirely until the late autumn, and may safely be lifted any time between the completion of their growth and that period.

Mr. Silas Cole, who is just retiring from the charge of Earl Spencer's gardens at Athorp Park, Northampton, is famous in horticultural circles for many things. He is a very capable all-round gardener, but of hardy fruits and vegetables—the distinctly utilitarian side of gardening—he has for many years been a foremost cultivator, and eminently successful exhibitor at the leading exhibitions. It was Mr. Silas Cole who gave us the first waved sweet pea, i.e., Countess Spencer, the lovely pink variety that startled the floricultural world when he exhibited it so finely at the first exhibition of the National Sweet Pea Society, held at the old Royal Aquarium in 1901. By the introduction of this variety a marvellous impetus was given to sweet pea culture, because it gave a new form, an added charm, to the popular and fragrant annual. Mr. Silas Cole has been 18½ years at Althorp Park, and succeeded his father as head gardener, the two, father and son, rendering thirty-three years' continuous service between them at this famous Midland establishment. Mr. Cole has a fine physique, long experience, ample skill, and abundant energy, so that, whatever position he takes up we are sure he will do it and himself credit.

Adiantum farleyense var. Gloire van Moordrecht.—In our issue of the 11th inst. we illustrated and described a beautiful adiantum that had been shown at the meeting of the Royal Horticultural Society held on January 31, under the name given above, when an Award of Merit was made in its favour. Although we were in some doubt as to the variety having been derived from Adiantum farleyense, we, as a matter of course, adopted the name under which the plant was shown, and stated that it appeared to have been raised from that well-known and justly popular fern. At the meeting of the Royal Horticultural Society's Floral Committee on Tuesday, the chairman, Mr. H. B. May, stated that since the preceding meeting Mr. J. Bier, the raiser, had visited him at Edmonton, and, in the course of conversation, stated that the new form had appeared as a chance sporeling among a batch of sporelings of Adiantum scutum. This last-named is synonymous with A. Gheisbreghti, a handsome fern that was raised many years ago in the nursery of Mr. B. S. Williams at Upper Holloway. This also sprang up as a chance sporeling, and is undoubtedly a variety of A. tenerum. That the newcomer should have originated in a similar manner may be disappointing to those who thought that at last A. farleyense had produced a fertile spore; but it does not in any way affect the value of the fern from the cultural standpoint. It is remarkably beautiful, free in growth, and evidently readily raised from spores, and has the promise of becoming highly popular.

R.H.S. Floral Committee.—Owing to the arduous work of this committee, the Council have, on the suggestion of Mr. William Marshall, V.M.H., appointed two chairmen, an arrangement by which the awards to novelties and the miscellaneous groups can proceed simultaneously. The co-chairmen are Mr. W. Marshall, V.M.H., and Mr. H. B. May, V.M.H., and, as at present arranged, the former will preside over the section making the awards to groups and the latter to that dealing with novelties.

The Journal of the Kew Guild.—After a rest of one year (there was no issue in 1909) the Journal of the Kew Guild has made a welcome reappearance, and the new issue is Vol. XVII. and XVIII. for 1909 and 1910. Always of unusual interest we cannot remember an issue more interesting than the one now before us, and we imagine every Old Kewite on receiving it will immediately devour its contents from beginning to end. Mr. R. Hooper Pearson, the managing editor of our contemporary, the "Gardeners' Chronicle," looks out from the frontispiece, and his portrait is accompanied by an appreciation from Mr. W. Watson's pen. The reports show a cash balance to date of £55 4s. 11d., plus £300 invested. We are glad to see that the annual general meeting is to be held in London again this year, and followed by a dinner and social evening. The work of the Mutual Improvement Society is reviewed, while the appointments and retirements of Kewites show the important positions "Guilders" are occupying both at home, in Africa, and the Far East. The bright little notes referring to alterations and additions in the Royal Gardens, Kew, and the social and business life of present Kewites will be read with great relish by those "in lands afar," while with equal interest those at home will read the delightful letters from Kewites in Zomba, Wollongong, Marsala (Portuguese East Africa); Youkeos, N.Y., and Singapore, as well as the humorous, descriptive, and instructive letter, telling of an Irish member's tour on the Continent. Kindly tributes are paid to the memory of Messrs. J. Garrett, W. Denning, C.W. Smythe, R. Pantling, J. Murrell, and F. Knowles, who have all passed away since the previous "Journal" was published. The issue concludes with the names and addresses of Old Kewites, these filling sixteen pages. We heartily congratulate the new secretary and editor, Mr. H. Cowley, upon the production of so excellent a "Journal."

Gardeners' Magazine Spring Number.—Our special number associated with the season of spring will be our issue for the 25th inst., and the arrangements we have made enable us to state that it will be one of the most interesting and useful spring numbers we have published. It will be almost exclusively devoted to matters requiring immediate attention, and the several contributions and numerous illustrations will afford valuable assistance in cropping the kitchen garden and making preparations for beautifying the flower garden, the conservatory, and the greenhouse during the summer and autumn months. As there is invariably a largely-increased demand for our spring issues we strongly advise those of our readers who require extra copies to give their orders early, and thus avoid disappointment.

Barcome Horticultural Society.—Mr. Frank Ballard has been elected secretary of this society in succession to Mr. Lademan, who retired in consequence of his leaving the district.

Dr. Daniel Oliver, F.R.S., who celebrated his eighty-first birthday at Kew a few days since, testifies in no uncertain manner to the beneficial effect of the study of botany upon health, and the salubrity of the Royal village. However that may be, his many friends will be glad to know that while he has outlived the greater proportion of his contemporaries in scientific circles, he enjoys excellent health, and takes a keen interest in the science in which he specially distinguished himself. It is now rather more than twenty years since Dr. Oliver retired from the position of keeper of the Herbarium at Kew, which he occupied for a considerable period with much success, and as near as may be half a century since he was appointed Emeritus Professor of Botany at University College, London, a position from which he retired in 1888. It is interesting to recall the fact that Dr. Oliver was awarded in 1884 the medal of the Royal Society, and in 1899 the medal of the Linnean Society. It is not without interest that Dr. Oliver has been followed in the keepership of the Herbarium by three botanists of distinction, all of whom are happily still with us. These are Mr. J. G. Baker, F.R.S., V.M.H., who was keeper of the Herbarium from 1890 to 1899, having previously been first assistant from 1866; Mr. W. B. Hemsley, F.R.S., V.M.H., who, after occupying the post of first assistant nine years, succeeded Mr. Baker in 1899 as keeper; and Dr. Otto Stapf, F.R.S., who succeeded Mr. Hemsley as keeper of the Herbarium on his retirement in 1908, and is busily engaged in maintaining the high reputation this department of the Royal gardens has so long enjoyed.

National Vegetable Society.—Appreciating the importance of taking time by the forelock, the committee of this society have issued the schedule of prizes offered for competition at the exhibition of the society, to be held at the Horticultural Hall on Wednesday, August 30. The schedule is comprehensive and the prizes liberal, and the exhibition should surpass the remarkable display produced last year.

Wimbledon Common Extension.—A further appeal is being made by Mr. Richardson Evans (hon. secretary), on behalf of the Wimbledon and Putney Commons Extension Fund. A sum of nearly £10,000 is needed in all for the acquisition of the 32 acres of land bordering the Beverley Brook, which is the first part of the larger scheme for saving as an open space the land in Kingston Vale. About £8,000 has already been paid, or promised, by private donors. The total area of the land in Kingston Vale which it is hoped to acquire is 172 acres, and the purchase price is £52,771. The Wimbledon Borough Council, the Maldens and Coombe Urban District Council, and the Merton Urban District Council have voted grants of £10,000, £3,500, and £500 respectively, but the grants are subject to the sanction of the Local Government Board, and are not immediately available. A City committee is to be formed with the object of addressing to the larger public of the Metropolis and the nation a more general appeal than has yet been made.

"**The Sweet Pea Annual,**" the official publication of the National Sweet Pea Society, has been issued to members, and a glance through its pages shows that it is a credit both to the society and the co-editors. The visits that were made by the members to Sutton Green, Kelvedon, and Marks Tey are described and illustrated, and other contents of an official character include a full report of the conference held in December last, an audit of the varieties shown at the society's exhibition, a catalogue of sweet pea names, and a report on the diseases of the sweet pea, all of which are both interesting and useful. Especially noteworthy among the contributions from members is the article on "Sweet Peas in British Columbia," from the pen of Mr. G. B. Dicks, showing, as it does, that these fragrant flowers enjoy a high degree of popularity in the Far West.

Bromley Chrysanthemum Society.—The committee of this society were able to submit a highly satisfactory report to the members on the occasion of the annual meeting, it being recorded that "There was a marked increase in the number of entries, and the quality of the exhibits throughout the show was above the average." The financial results of the year's work were also satisfactory. Mr. Patterson, who has been hon. secretary for some years, retired owing to his leaving Bromley, and was accorded a hearty vote of thanks for the services he had rendered the society. Mr. F. Andrews, the hon. assistant secretary, was appointed secretary.

Membership of the B.G.A.—There are now over two thousand members of the British Gardeners' Association. The Council is optimistic, and says: "There is magic in numbers. Small numbers depress; large numbers inspire. Let us therefore continue our efforts to increase our membership this year from 2,000 to 3,000 and then onwards, and the B.G.A. will become an irresistible force for good in the realm of horticulture."

ROYAL HORTICULTURAL SOCIETY.

As usual, on the occasion of the annual meeting of the society, there was a fine display in the Great Hall, and a very large number of Fellows and visitors. Early spring flowers, orchids, primulas, carnations, and camellias were leading features. Novelties were not numerous.

FLORAL COMMITTEE.

A beautiful and attractively arranged groups of forced shrubs, associated with palms and ferns, was set up right opposite the main entrance by Messrs. R. and G. Cuthbert, Southgate. Once more they had tall standard lilacs, laburnums, wistarias, and pyruses rising over standards and bushes of the lovely Prunus triloba, lilacs in great variety, Azalea mollis in lovely shades of colour, magnolias, and Staphylea colchica.

Indian azaleas in standard form, ranging from 3ft. to 5ft. high, and carrying freely-flowered heads, were grouped over ferns by Messrs. Jas. Veitch and Sons, Chelsea. This firm also occupied its usual position, and filled out a good length of tabling with dwarf azaleas, forced lily of the valley, the fragrant and bright yellow Primula Kewensis, a splendid strain of P. obconica, and a few greenhouse rhododendrons.

Perpetual carnations were presented in large numbers by Messrs. W. Cutbush and Son, Highgate, who displayed large vases of Mrs. Fortescue, May Day, Lady Elphinstone, White Enchantress, Rose Doré, Lady F. Waring, etc. In another group the Highgate firm displayed, in rock garden fashion, such charming shrubs as Rhododendron præcox, Hamamelis arborea, H. Zuccarini, and magnolias, with little groups of Iris histrioides major, I. send-pers, I. reticulata, Tulipa Kaufmanniana, Cyclamen coum, Soldanella alpina, Adonis amurensis, etc.

Messrs. H. B. May and Sons, Edmonton, showed a lot of dwarf pillar-shaped specimens of creeping ferns, and these made up a novel group; Drymoglossum spathulatum, D. pilosilloides, D. carnosum, Davallia heterophylla, Asplenium obtusilobum, Polypodium vacciniifolium album, P. repens, and Niphobolus rupestris were the leading kinds. At one end of their group the Messrs. May had placed on a paper-covered board fronds of fifteen varieties of Nephrolepis exaltata, showing in a remarkable manner the development of the species horticulturally during the past ten years. In order of plumose development the varieties were: Fosteri, Piersoni, Barrowsi, elegantissima, e. compacta, todeaoides, Whitmani, Amerpohli, superbissima, magnifica, Scholzeli, lycopioides, Marshalli, and Marshalli compacta.

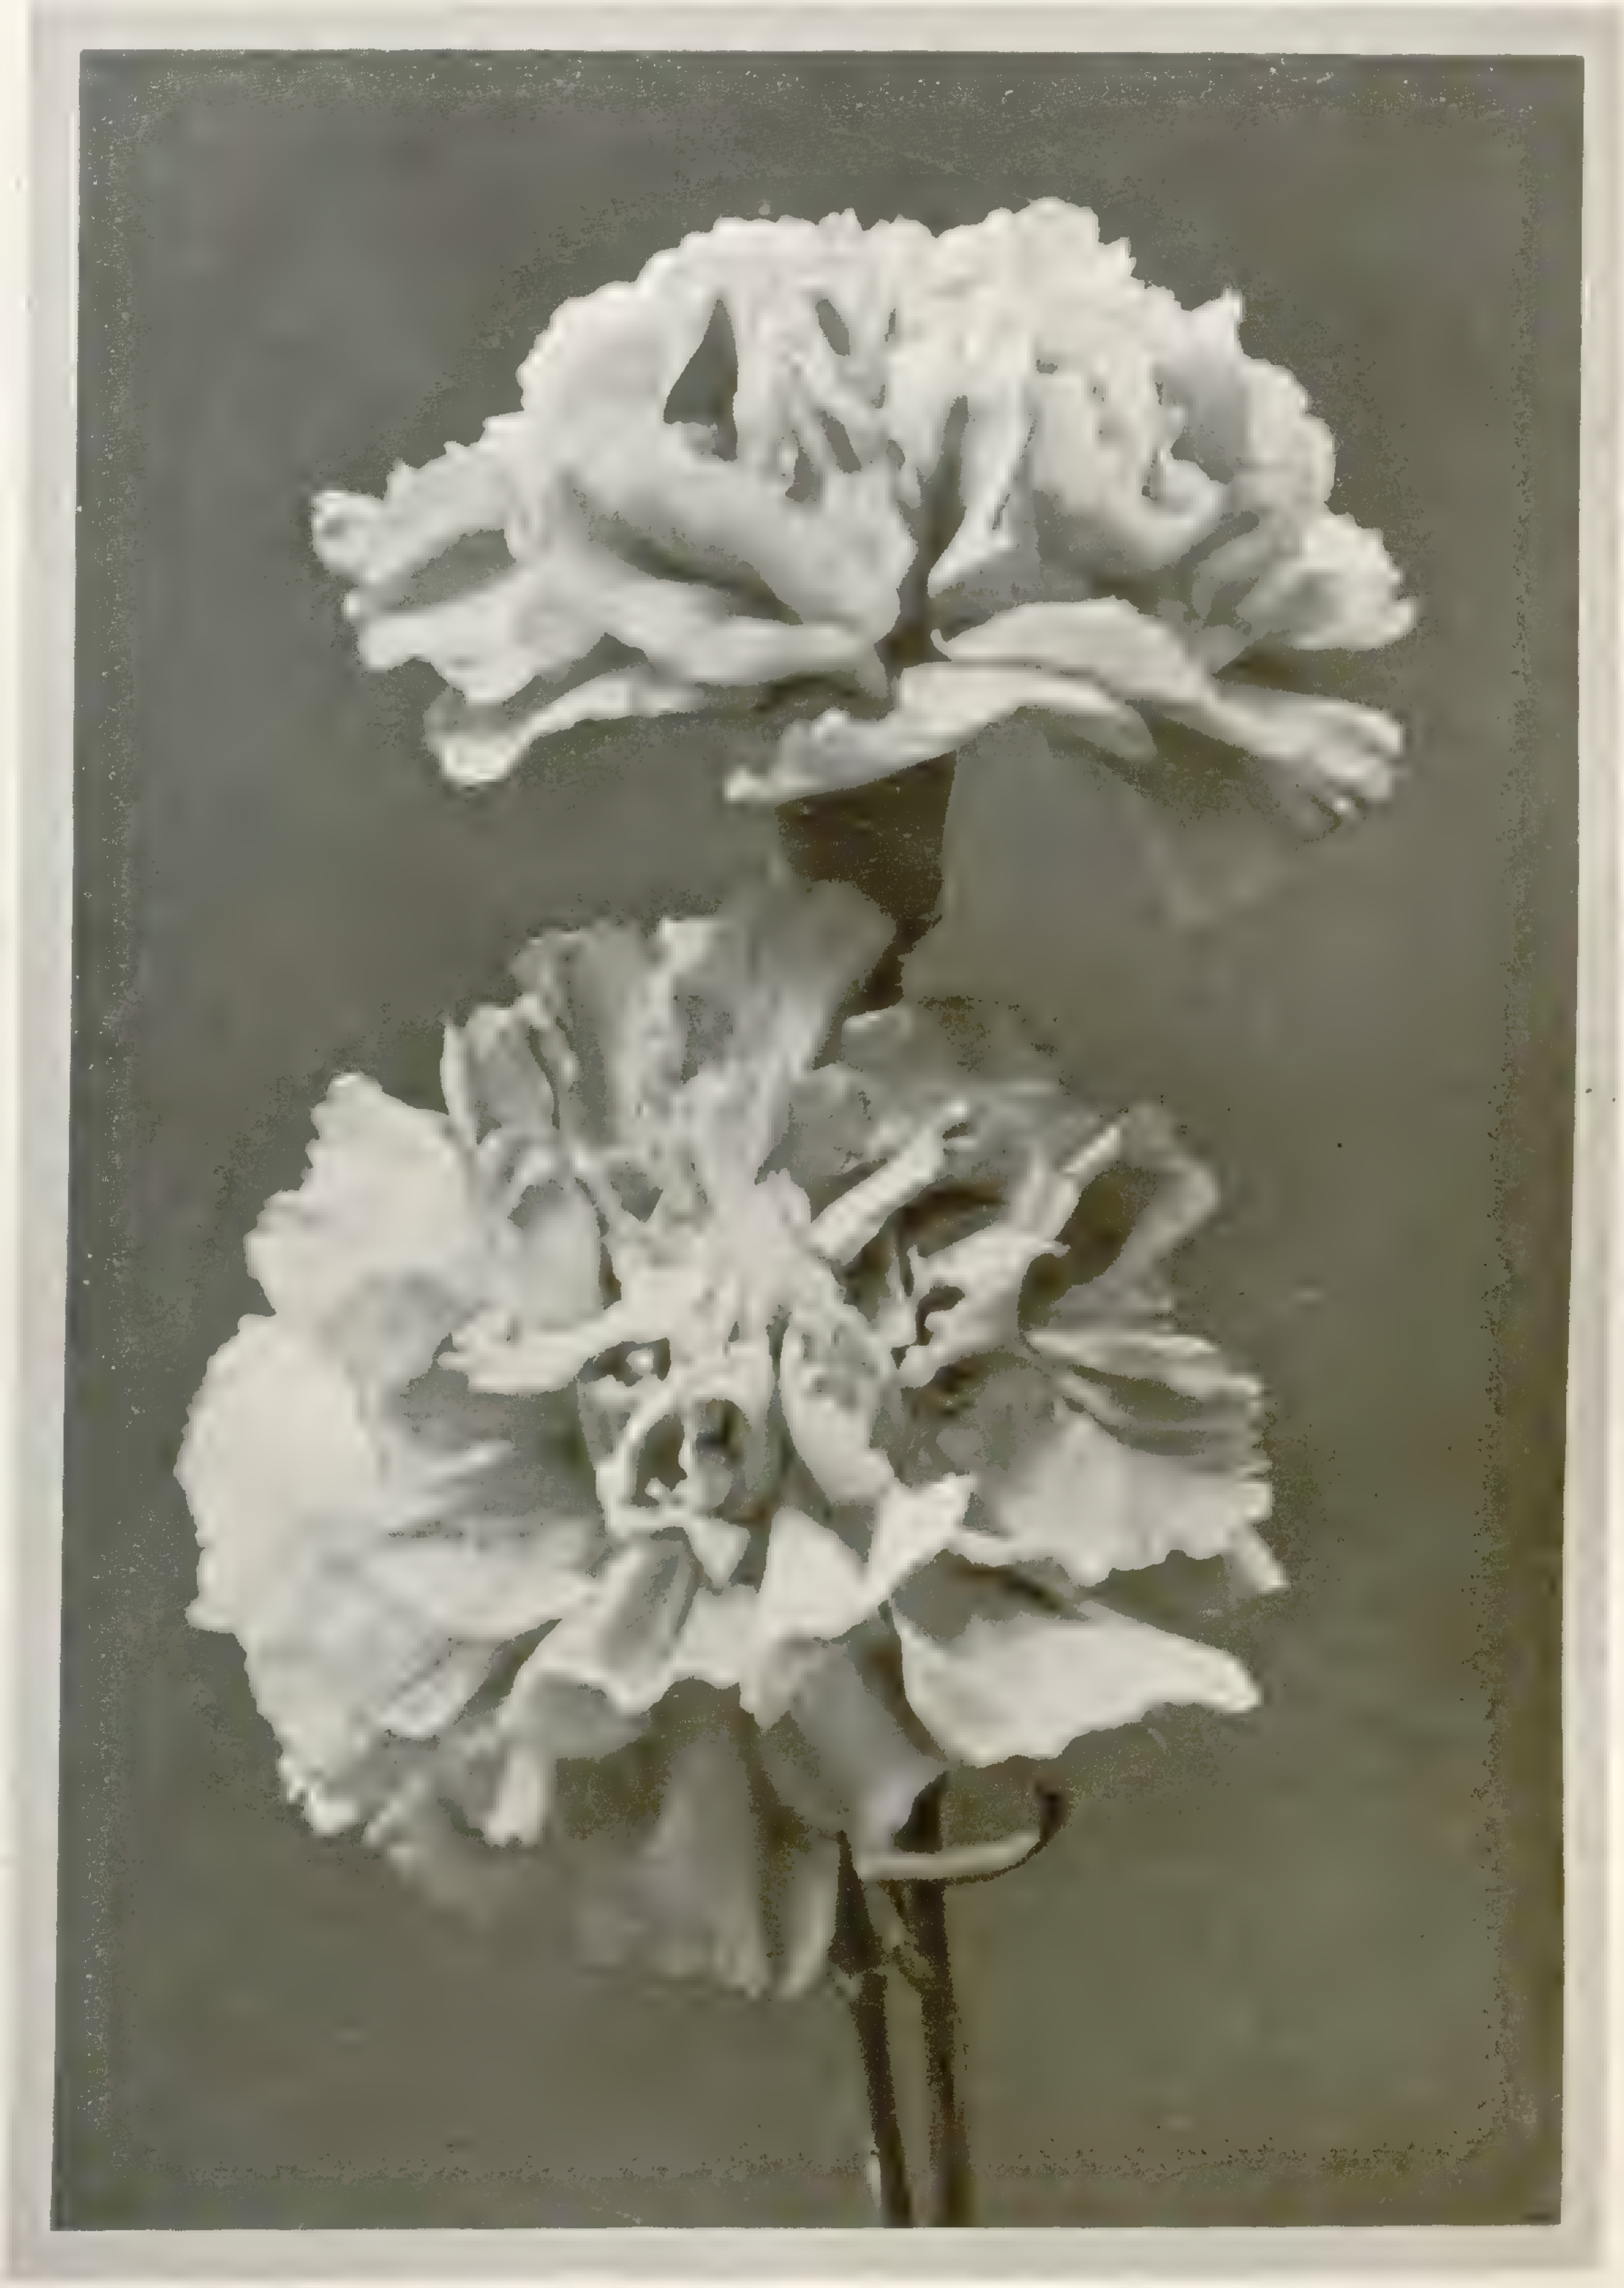
Some beautiful bertolonias and anœctochilus, under bell glasses, were brought up by Mr. L. Russell, Richmond, who also contributed a large number of Indian azaleas and a batch of the blue Francisca calycina.

Dainty irises, and beautiful little groups of hardy cyclamens, early crocuses, hepaticas, saxifragas, and primulas, were grouped among rocks, in front of heaths, rhododendrons, and pernettyas, by Messrs. R. Wallace and Co., Colchester.

A little model rock garden from Messrs. J. Cheal and Sons, Crawley, attracted a good deal of attention. A few flowering shrubs and some small conifers were placed on the higher portions, while along the front were colonies of Primula rosea, P. denticulata, Iris reticulata, some tulips, and Dog's Tooth violets.

Messrs. Wm. Paul and Son, Waltham Cross, filled one corner of the hall with a fine healthy lot of camellias in pots, the plants ranging from 2ft. to 10ft. high. The rich green of the shining leaves served to show up the beauty of the flowers of such fine varieties as Mercury, Mars, Eugenie, Messina, elegans, imbricata, alba plena, etc.

Early spring flowers were prettily shown by Messrs. Barr and Sons, Covent Garden, and these included Adonis amurensis, beautiful crocuses in variety, hardy cyclamen, snowdrops, saxifragas, heaths, and a batch of the elegant Primula malacoides.



NEW PERPETUAL CARNATION CORONATION.
Colour, rich pink; A.M., R.H.S., February 14. Mr. B. Bell, Guernsey.

Messrs. Heath and Sons, Cheltenham, filled the upper corner of the hall with a rock garden, which they somewhat sparingly furnished with saxifragas, hardy primulas, crocuses, hepaticas, cyclamen, etc.

Messrs. Stuart Low and Co., Enfield, showed carnations in variety, and associated these with ferns in stands and bowls; this firm also presented some very fine cyclamens, notably those with salmon-coloured flowers.

Messrs. W. Wells and Co., Merstham, put up a few large vases of the new perpetual carnation named White House.

A large batch of the graceful rosy-lilac-flowered Primula malacoides, from Messrs. Whitelegge and Page, Chislehurst, made a charming display, and further demonstrated the usefulness of this species.

Mr. H. C. Pulham, Elsenham, Essex, brought forward a quite small display of alpine shrubs and flowers.

A bold bank of florists' forms of cinerarias, from Messrs. H. Cannell and Sons, Swanley, showed a fine range of attractive colouring, but even more brilliant were the bunches of zonal pelargoniums, such varieties as Jupiter, St. Louis, King Victor, Naples, and Bombay being especially effective.

Seedlings of the exquisite little Cyclamen ibericum made up a pretty little group, with seedling freesias, chiefly yellow shades, from Mr. F. H. Chapman, Guldeford Lodge, Rye.

Some choice alpine and early spring flowers were displayed by Mr. Maurice Prichard, Christchurch, with hellebores, Morisea hypogæa, Primula denticulata, tiny irises, saxifragas, crocuses, anemones, etc., were all very delightful.

Mr. H. Burnett, Guernsey, put up a lovely lot of carnations again, including Mrs. Burnett, Dorothy Gordon, Britannia, Marmion, Aurora, Mikado, R. F. Felton, Mrs. C. F. Raphael, Sultan, Scarlet Glow, Mrs. W. J. Hunter, and other beautiful varieties.

Messrs. Sutton and Sons, Reading, had a bank of Proserpine, Vermilion Brilliant, Orange Blossom, Montresor, and White Joost van Vondel tulips, and on another table set out a splendid exhibit of their grand strains of Chinese primulas, beautifully grown, and of fine form and colour; Duchess, Giant Pink, Salmon Pink, Crimson King, Giant Crimson, Royal White, and Reading Blue were a few of the leading varieties on view.

Messrs. G. Mount and Sons, Canterbury, put up a lovely lot of beautiful flowers of the charming and brilliant Richmond roses.

Mr. G. Reuthe, Keston, brought forward an interesting lot of choice hardy shrubs, and a collection of beautiful early irises, crocuses, snowdrops, saxifragas, hepaticas, primulas, etc.

Messrs. T. S. Ware, Feltham, had a rock garden, furnished with hellebores, Adonis amurensis, Primula malacoides, Iris reticulata, Corydalis angustifolia, primroses, Morisia hypogæa, etc.

From Mr. B. G. Bell, Castel Nursery, Guernsey, came a beautiful carnation, under the name of Coronation (A.M.), the blooms being of medium size and superb form, and the colour rich pink.

ORCHID COMMITTEE.

A beautiful group of orchids, was put up by Mr. H. G. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, and it consisted almost entirely of a huge Cattleya Trianæ Hydra, and wonderfully well-grown examples of white Lælia anceps, all staged in a groundwork of green moss. The central specimen of Cattleya Trianæ Hydra carried twenty-two spikes, and a total of ninety-six flowers; this was a plant of three leads in 1904, therefore its present condition is high testimony to Mr. Alexander's skill. There were about a score of plants of white varieties of Lælia anceps, carrying a total of 94 spikes and about 330 lovely flowers. Several specimens carried three dozen flowers each. The varieties represented were L. a. Williamsiana, L. a. alba, L. a. Schroderiana, L. a. albida, L. a. Sanderiana, L. a. alba Bull's var., the purest white of all, and L. a. Williamsi.

Messrs. Jas. Cypher and Son, Cheltenham, presented a large group of interesting and beautiful orchids; in the centre they had spikes of Cymbidium insigne with calanthes below them. A few dendrobiums were associated with varieties of Lycaste Skinneri and Cattleya Trianæ, but cypripediums were a leading feature. Among the latter good things were Cypripedium Venus, C. Helen II., C. Mrs. Mostyn, C. aureum virginale, C. Beekmani, C. Curtmanni, and C. Thompsoni.

Messrs. Sander and Sons, St. Albans, exhibited the rare Odontoglossum coronarium brevifolium, carrying eight spikes of flowers, with Odontioda Cooksoniæ, Odontoglossum McNabianum, O. Warscewiczi, O. Thompsonianum, O. Cooksoniæ, Cypripedium Chapmani, and C. Helen II.

Messrs. Charlesworth and Co., Haywards Heath, contributed another beautiful group of orchids, the whole centre of the display being composed of Phalænopsis Schilleriana with a score or more of lovely spikes, odontoglossums in great variety and beauty, Odontioda Bradshawæ, O. St. Lucien, O. Vuylstekeæ, Renanthera Imschootiana, white forms of Lælia anceps, Zygocolax Charlesworthi, numerous finely-fringed and exquisitely beautiful Brasso-cattleyas, the handsome Lælio-cattleya Luminosa, and Sophro-cattleya Marathon—a variable hybrid, some dendrochilums and cypripediums.

From Gatton Park, Mr. Collier, gardener to Sir Jeremiah Colman, Bart., brought up some well-grown specimens of Dendrobium Lady Colman, finely flowered and very attractive.

Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, exhibited some striking seedling odontoglossums, notably O. Lambeauianum Purple Queen, O. Vuylstekeæ, O. amabile, O. Valeria (Edwardi x Vuylstekei), and O. Verona (Adrianæ x O. Vuylstekei), all of great promise.

The fine Cypripedium Beryl, C. Carola, Cattleya Mendeli (blush variety), and Lycaste Skinneri with rosy flowers.

The group of cypripediums shown by Mr. E. V. Low, Vale Bridge, Haywards Heath, contained many good things, such as Cypripedium aureum Surprise, C. Fulshawense, C. Beekmani, C. Godefroyæ leucochilum, C. Leonides, C. Venus, C. Minos Young's var., and C. Maudiæ.

Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, showed the fine Cypripedium Wellesleyæ, four flowers; C. Little Gem, and C. Nerissa.

Mr. Day, gardener to H. S. Goodson, Esq., Putney, brought up Odontoglossum ardentissimum G. E. Day, finely blotched; O. a. Lamas, heavily spotted, and Cattleya Trianæ Goodsoni.

Messrs. Theodore Pauwels and Co., Meirlebeke, Ghent, sent over the handsome Brasso-cattleya Senateur de Bast (B.-c. Mossiæ Digbyana crossed with B.-c. Mrs. Leeanum); and Cymbidium Lawrenceanum, a new cross between C. insigne and C. Lowianum concolor.

Dendrobiums figured largely in Messrs. Stuart Low and Co.'s group, brought up from Enfield, and with these were cypripediums in variety, good forms of Cattleya Trianæ, Angræcum citratum, Pleurothallis Roezli, Brasso-cattleya Leemanæ, etc.

Messrs. Armstrong and Brown presented Odontioda Bradshawiæ in fine form, Vanda Amesiæ, and some good cypripediums, such as C. Admiral Wilson, C. aureum Hyeanum, C. Mary Beatrice, C. Dauphine, C. Beryl splendens, and C. Venus Orchidhurst var.

Messrs. J. and A. McBean, Cooksbridge, Sussex, showed some good forms of Cattleya Trianæ, a good plant of Cymbidium eburneo-Lowi, beautiful odontoglossum spikes, white varieties of Lælia anceps, and a few good cypripediums.

FRUIT AND VEGETABLE COMMITTEE.

A grand lot of vegetables from Messrs. Sutton and Sons, Reading, showed the range of subjects available at the present season. There were Early White broccoli, leeks, savoys, turnips, carrots, parsnips, artichokes, spinach, winter radishes, Brussels sprouts, celeriac, Stachys tuberosa, celery, A1. kales, and sprouting kales.

About four dozen dishes of well-kept apples from Mr. W. H. Divers, gardener to the Duke of Rutland, Belvoir Castle, Grantham, were greatly admired, especially the dishes of Gascoigne's Scarlet, Lord Derby, Annie Elizabeth, Newton Wonder, Dumelow's Seedling, etc.

Some grandly grown onions, clean, smooth potatoes, fine carrots, beet, parsnips, and turnips, were shown by Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted. It was a splendid exhibit of remarkably well-grown roots.

Oranges growing on bushes of various sizes, and also picked fruits, made a very handsome exhibit from Messrs. T. Rivers and Sons, Sawbridgeworth; St. Michaels, Achilles, and Bijou varieties were very finely shown, the bushes carrying large crops of golden luscious fruits. Limes, lemons, and citrons were also exhibited.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Brasso-cattleya Senateur de Bast, from Messrs. Theodore Pauwels and Co., Meirlebeke, Ghent.

Award of Merit.—To Cypripedium Carola, from Messrs. Hassall and Co., Southgate; to Cymbidium Lawrencianum, from Messrs. Theodore Pauwels and Co., Ghent; to Cypripedium aureum Laekenense, from Mr. E. V. Low, Haywards Heath; to Carnation Coronation, from Mr. B. Bell, Guernsey.

MEDALS.

Silver-Gilt Knightian.—To Messrs. T. Rivers and Son, Sawbridgeworth, for oranges.

Silver-Gilt Flora.—To Messrs. Wm. Cutbush and Son, Highgate; to Messrs. Sutton and Sons, Reading, for primulas and tulips; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver-Gilt Lindley.—To Lieut.-Col. Sir George Holford (grower, Mr. H. Alexander) for orchids.

Silver-Gilt Banksian.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. R. and G. Cuthbert, Southgate, for flowering shrubs; to Messrs. Jas. Veitch and Sons, Chelsea, for azaleas, etc.

Silver Flora.—To Mr. C. Engelman, Saffron Walden, for carnations; to Messrs. H. B. May and Son, Edmonton, for ferns; to Messrs. Wm. Paul and Son, Waltham Cross, for camellias; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids.

Silver Knightian.—To Messrs. Sutton and Sons, Reading, for vegetables; to Mr. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted, for vegetables; to Mr. W. H. Divers, gardener to the Duke of Rutland, Grantham, for apples.

Silver Banksian.—To Messrs. Sander and Son, St. Albans, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. H. Cannell and Sons, Swanley, for cinerarias and pelargoniums; to Messrs. G. Mount and Sons, Canterbury, for roses; to Mr. L. R. Russell, Richmond, for azaleas, etc.

Bronze Flora.—To Messrs. J. Cheal and Sons, Crawley, for rock garden; to Mr. Maurice Prichard, Christchurch, for alpine flowers; to Messrs. R. Wallace and Co., Colchester, for hardy plants; to Messrs. T. S. Ware, Ltd., Feltham, for hardy flowers.

Bronze Banksian.—To Mr. G. Reuthe, Keston, for hardy plants.

ANNUAL MEETING.

There was a large attendance in the Lecture Room when Sir Trevor Lawrence, Bart., took the chair at the annual general meeting. After the reading of the minutes and the observance of other formalities, and the election of 76 new Fellows, the President moved the adoption of the council's report and balance-sheet, as circulated, and as referred to recently in our columns. He referred to leading points in the report, notably the death of King Edward VII.; the patronage granted to the society by King George V. and Queen Mary; the development of the work at Wisley, especially the scientific side of it, by Mr. Chittenden; the accommodation for gardeners at Wisley; the forthcoming exhibition at Olympia, which should be the finest exhibition of its kind ever held in London during the summer; the splendid Colonial Fruit Show last autumn; the abundant returns Fellows received for their subscriptions—far more than face value, according to Sir Edward Grey's account; the satisfactory manner in which the Lindley Library had been placed under the care of the R.H.S. Council; the decease of Sir Henry Schröder, and the enormous assistance, financial and otherwise, he had rendered the society. Sir Trevor closed with a eulogy of the services rendered by the Rev. W. Wilks, the whole of the R.H.S. staff, and the various committees.

Mr. J. Gurney Fowler seconded the motion, and pointed out that the surplus of income over expenditure, amounting to £8,370, was an advance of £721 on the previous year; but, had it not been for such special items of expenditure, such as the new bothy at Wisley, the grant to International Exhibition, and the Schröder Memorial Fund, the surplus would have been £2,169 better than in 1909.

Mr. Elwes expressed his gratitude for the prospects of the library, and referred to the great financial success the council had achieved during the year. He thought, however, that some of the surplus funds might well be devoted to the improvement of the "Journal," or to the publication of "Transactions," that would compare favourably with those issued by the society in its earlier years. He contended that the present "Journal" was not as valuable a publication as the society should possess. Mr. Chittenden and Mr. Wilks had already as much work as they could manage apart from this publication, consequently there was need of a Publication Committee, and the expenditure of sufficient money to bring out a quarto issue containing valuable contributions and ample illustrations.

Sir Trevor contended that the "Journal" was a valuable production, and not so bad as Mr. Elwes had made out, and his contention met with a murmur of approval. Sir Trevor promised, however, that the matter would receive consideration from the council. The motion was then put and carried unanimously.

The officers of the society were all re-elected, and the president then presented the Victoria Medal of Honour in Horticulture to Mr. Thos. Coomber, Mr. John Cypher, Mr. C. Fielder, Mr. H. B. May, and Mr. Alfred Pearson, and the Lawrence Medal to Mr. Harry J. Veitch.

Sir John T. D. Llewelyn, Bart., proposed and Mr. A. W. Sutton seconded, a vote of thanks to the president, which was very heartily accorded, and the meeting was brought to a close.

CHOICE PLANTS FOR SOUTH WALLS.

It is surprising what a great variety of plants can be grown on a wall facing south. The following list might be of value and service to intending planters; all the species are grown here:

Daphne japonica, flowers, as a rule, about March 20, and is quite as good and sweet as the indoor D. indica; Rosa fulgida, Bignonia grandiflora Madame Salen, an improved form; Sophora tetraptera, Abutilon vexillarium, which flowers excellently all through the summer and well on towards Christmas; Kadsura chinensis, flowers freely; Mandevilla suaveolens, flowers well, and has seeded outside; Clianthus puniceus var. magnificus, Bridgesia spicata, Callistemon salignus and C. s. alba, both flower well; Acacia longifolia, Cinnamomium Lourei (cinnamon), Edwardsia grandiflora, and Solanum jasminoides, which grows rampantly and flowers profusely all through late summer and autumn.

Lagerstrœmia indica, has also flowered in open quarters; Ceanothus Fendleri, Banksia quercifolia, Crinodendron Hookeri, Magnolia compressa, Jasminium primulinum, Olearia nitida, Leptospermum grandiflora, Senecio Grayi, and S. rotundifolia, Drimys Winteri and D. aromatica, Adenocarpus anagyrus, Melanleuca hypericifolia, Abutilon vitifolium, Azara integrifolia, Myrtus communis, Quillaya saponaria (Soap tree), Bignonia cherere, Acacia trovissima, Leptospermum bullatum, Ceanothus Les Plantiers and C. Gloire des Versailles, Edgeworthia chrysantha—will soon be in bloom; Myrtus Jennie Reitenbach, Camphor officinalis, Dendromecon rigidus, Buddleia Colvillei, Corinella pygmæa, in bloom: Fendlera rupicola, Olea fragrans, Corokea budleoides, Callitrus robusta, Ephedra altissima, Lonicera tragophylla, Ceanothus Veitchianus, Widdringtonia Whytei, camellias, Azara microphylla, Rhyncospermum jasminoides, Freemontia californica, Carpenteria californica, Caryopteris mastacanthus—this also does well on a border, but by growing it on a wall we have a longer succession of its pretty blue flowers; Desmodium pendulum, pittosporums, and Chimonanthus fragrans.

The main points in growing these things satisfactorily are plenty of water in summer, ample root protection during winter, and a slight covering when frosts are of 15 degrees and over. W. A. Cook.

TREE PÆONIES.

While so much progress is being made among herbaceous pæonies, and while these handsome subjects are being so extensively planted, there is a little danger lest the many attractions of the wondrously beautiful Moutan or Tree pæonies be overlooked. Among shrubby plants there are now a veritable host of delightful subjects, with a wide range of form, habit, and colour, as well as season of flowering, consequently almost every taste may be met and every part of the garden glorified by their use. But if we except rhododendrons hardly anything in this wide range is so noble and effective when in bloom as the tree pæony.

TREE PÆONIES—A STUDY.

At this season of the year a reference to tree pæonies is timely, because from now on to April planting may be safely done. The one great drawback in connection with the culture of tree pæonies is that a mild spring hastens the swelling or opening of the bloom buds, and in our treacherous spring times a late frost may spoil the effect that would otherwise be produced. But the same remarks apply to precocious rhododendrons. Some care, therefore, must be exercised in the selection of sites for tree pæonies, and positions be chosen where there is shelter from cold east winds, and where a little protection may be quickly given in the event of severe late frosts. So magnificent are the immense blooms that a little care and attention in this matter is amply repaid.

The flowering season is from early May until well on into the month of June, according to locality and position. Though not fastidious as to soil, it is now generally recognised that tree pæonies are at a distinct advantage when grown in strong loam. Not only are these pæonies splendid for garden adornment, but they are eminently serviceable for conservatory decoration during the early months of the year. Grown in pots or tubs, and carefully looked after when the blooms have faded, they respond readily year by year to very gentle forcing, and their big blooms, white, pink, red, crimson, and purple are a fine contrast to the smaller flowers of the majority of forced shrubs. Varieties are numerous, and large numbers of plants are imported from China and Japan each year, and these often bear quaint and almost unpronounceable names. Some of our leading growers, notably Messrs. J. Kelway and Son, Langport, have raised new varieties at home, and all are beautiful, whether with double or single flowers.

Strawberries.—The earliest batch, as soon as the blooms are over and the fruit well set, should be taken into a warmer house where they can be urged along, for they can be forced quickly at this stage and with success. As soon as it can be seen which fruits are swelling the best, thin out the badly-formed ones, and do not overcrop.—W. A. Cook, Leonardslee Gardens.

FERN SPORE ARRANGEMENT.

Although, as a rule, the arrangement of the spores of a fern frond is by no means conspicuous when the plant is superficially viewed, owing to their being placed generally on the underside of the fronds, and hence are hidden, and although the specific forms of fronds vary greatly both in size and make within the limits of one and the same genus, the character of spore arrangement has been found to be the most persistent of all features upon which botanists can depend for classification purposes.

As all fernists know, the fructification which we see on the frond backs, and sometimes elsewhere, does not consist merely of loose spores, but of collections of almost innumerable pods, or sporangia, attached to the frond by little stalks. In the vast majority of cases these sporangia resemble each other closely, even in widely different genera, and the prevailing type is that of an oval brown capsule supported by a brown stalk, which in a ribbed form passes up one side of the capsule, and over the top of it, and finishes somewhat abruptly half-way down the further side. The top of the capsule thus somewhat resembles a fireman's helmet. Within this capsule there are a score or two of spores, which, under a strong lens, are seen to vary in shape somewhat in different genera, some being smoothly oval, some oval with ridges, others pyramidal, and so on, but all, as a rule, equally minute and dust-like, as very fine snuff.

This description applies to most genera, and, of course, species, but there are exceptions, as in Osmunda regalis, where the pods are unribbed, oval, and of a dull green when ripe, as are the spores themselves, and in Polypodium vulgare, where the pods are comparatively much larger than usual, and with the also larger spores, are of a rich orange-yellow. Assuming that P. vulgare is properly allocated to the same genus as our other polypodies, P. dryopteris, P. phegopteris, and P. calcareum, we have here an instance of extreme divergence within one genus, since the spore heaps of all these three are unusually small, and nearly black, as are the minute spores themselves. This, however, brings us to our point, viz., spore arrangement, and in these last cases the genus common to all four is determined by the fact that the spore heaps are in all cases round or oval, and quite devoid of any such protecting cover or "indusium," as is found in the majority of other genera. The polypodium family is a very large one, and assumes many forms, but wherever we come across a fern in which the spore heaps are round, dot-like, and naked, we are quite safe in assuming it to be a member of the polypodium family, and, as a rule, the heaps will be large, and resemble those of our familiar P. vulgare in shape and size, though hardly in brilliance of colour.

The diversity of arrangement, taking the ferns of the world as a whole, is such that space precludes us from touching fully upon more than our home species. Following on then with the genus of spleenworts, or asplenia, of which we have several species, Asplenium trichomanes, A. viride, Adiantum nigrum, A. lanceolatum, A. marinum, A. ruta muraria, A. ceterach, A. fontanum, A. septentrionale, and A. germanicum; the spore heaps in all of these lie in straight lines along the veins springing from the midribs of the divisions, herring-bone fashion, and although when the spores are fully matured it is difficult to detect the indusium, it is nevertheless there, though buried, and is very obvious when the fronds are young, as a whitish line in the position indicated. Of course, in such short-pinnuled ferns as the wall rue, the lines are so short as hardly to look like lines at all, but the principle is there, and they are not rounded dots, and wherever space permits the straight line presents itself.

In the hart's-tongue, which is undoubtedly a close relative of the spleenworts, though so different in appearance, and so much more variable, we see a curious modification of this linear arrangement. The large sausage-shaped spore heaps which the hart's-tongue produces so abundantly are found, when closely examined, to consist, not of a single line like the asplenia, but of two opposed lines, i.e., with the indusia face to face, so that when the fertile frond first unfolds, we see the future spore heaps as long whitish lines, split in the centre, and as the sporangia develops, they lift these twin indusia, and eventually entirely overlap, and bury them in the mass of brown spore pods produced. This type of twin sori, or spore heaps, is rare, and whenever a fern exhibits it throughout, we may name it a hart's-tongue. Adhering still to the linear type of spore heap, Pteris aquilina, the Common Bracken, presents a native example of a very large family, and the only one indigenous to this country in which the sporangia lie in lines along the edges of the frond segments, which edges are turned over to act as an indusium. Blechnum spicant, by virtue of its narrowed fertile fronds, somewhat resembles this, but is differentiated by having an independent indusium within the margin which is not reflexed, and it is this which differentiates it from lomaria, to which it is often wrongly ascribed, as the latter fern, like pteris, protects its spores by reflexing the edges of the contracted fertile fronds, and has no indusium other than these.

We may now turn to the two families of lastreas (or nephrodiums) and polystichums, popularly termed Buckler Ferns and Shield Ferns, which terms, as a buckler is a shield, do not clearly differentiate the two. There is, however, a distinct difference, since although superficially the round spore heaps and their covers resemble each other, on closer examination we shall find that in the lastreas the spore cover is distinctly kidney-shaped, and is attached to the frond at the indentation of the kidney, while in polystichum it is perfectly circular, and attached to the frond by a rudimentary central stalk, mushroom fashion. This difference is quite constant, and the term nephrodium, implying a kidney form, is, therefore, a good name for the lastreas, and, obviously, cannot embrace the polystichums as does the botanical term "aspidium" which covers (in our opinion wrongly) both genera, despite their difference in this and other characters.

In Adiantum capillus veneris, another solitary member of a large family, we have the spore heaps arranged in broken marginal lines, with the front edges acting as an indusium, like pteris, but broken into short lengths. In the Bladder Ferns we have dot-like heaps, covered with convex indusia resembling little bladders, whence the name. In the Lady Fern we have a rather indeterminate form of fructification, the small spore heaps being more or less horse-shoe shaped, with a rugged indusium springing from the centre, a little on the lines of an imperfect lastrea fructification. In Allosorus crispus the fertile fronds are contracted with the spore heaps in lines along the centre of the frond segments. In Osmunda regalis, the tips of the fronds carry the sporangia in naked clusters, arranged on otherwise bare stalks, but occasionally leafy portions appear with irregular clusters on their edges. As these spore clusters are borne on stalks, which follow the general plan of osmunda frond division, the result is a terminal somewhat resembling a faded spiræa flower panicle, whence the popular, but erroneous, name of the Flowering Fern.

Both in the Adder's Tongue and Moonwort we have the spores borne on specialised fronds, the one a simple spike, and the other a divided one, both having large capsules very different from the usual fire-helmet pattern. The Filmy Ferns bear these spores in a peculiar way. Hymenophyllum Tunbridgense and H. unilaterale having them in little urn-shaped projections on the fronds, and Trichomanes radicans in deep cup-shaped marginal cavities, the sporangia being attached to a central stalk, which projects so far as to resemble a bristle, whence the name of Bristle Fern. Finally, the woodsias have dotlike heaps seated within a peculiarly shaped indusium, like a long-rayed star; while the little annual Gymnogramma leptophylla, to complete our list, has, like all the large family it belongs to, the sporangia distributed in lines along the veins, and without any indusium at all.

To those who possess a microscope we may say that under a good power lens these sporangia and spores are very pretty objects, and the former, if freshly gathered when ripe, readily display their bursting and scattering powers when brought into a warm dry dwelling room, spread loosely on a glass slip under the lens, and viewed by transmitted light.

Chas. T. Druery, V.M.H., F.L.S.

APPLE BEAUTY OF KENT.

This is one of the most showy apples in cultivation when well grown, but varies in appearance more than almost any other in different soils and climates. This variation was strikingly exhibited at the Royal Horticultural Society's great fruit show in 1907, when there was a separate class for this variety, some being green and some coloured, some regular in shape and some strongly ribbed at the crown, but none so large as that mentioned by an American writer who says that it frequently measures sixteen or eighteen inches in circumference. It was introduced more than a century ago, but only received an Award of Merit from the R.H.S. in 1901. It is regarded by many as synonymous with the Flower of Kent, but Dr. Hogg makes them distinct varieties. The Beauty of Kent is a vigorous and spreading grower, with an inclination to droop, and this should be remembered when planting as it wants more room than most, too much, indeed, for small gardens. It makes a large orchard standard, but the finest fruit is produced from dwarf trees on the Paradise in warm soils, when it is really superb, though it suffers greatly, both in appearance and quality, in cold and wet soils.

Dr. Hogg says he always found it subject to canker when grown on the Paradise, as well as on damp and heavy soils, but this has not been my experience. The principal complaint I have to make against the variety is that it is more subject to spottiness than any other sort I know. The fruit will keep till April, but its best season for cooking is from November to January, and, when well grown, it is a fair dessert apple in January and February, being then exceptionally tender and juicy. For baking it is surpassed by few other varieties. Alger Petts.

CANARY GUANO

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all round results as CANARY GUANO. It is used in the King's Gardens, and by leading Amateurs and Trade Growers all over the Country. A post card to the Manufacturers will ensure full particulars.

LATE SUPPLIES OF POT STRAWBERRIES.

Though in many gardens, large ones in particular, a constant supply of both early and late forced strawberries has to be kept up, it is nevertheless the late crops, owing to one or another reason, such as want of conveniences for growing early ones, that are the most generally cultivated. Though much skill has to be exercised in bringing early crops to perfection, there is, perhaps, equally as much required in the production of good late ones. The needs of the plants in preparation are identical, except that in the case of those intended for late supplies, it is advisable to use pots of a larger size than is necessary for early forced plants. The reason for this is obvious when the condition of the weather at the time the plants are growing, and the fruit ripening, is taken into account.

The pots used here for late plants are 6½ inches in diameter, inside measurement, and though larger than is sometimes recommended, we find no difficulty in getting them well filled with active roots. We winter this batch in skeleton frames, with the pots plunged in fine ashes, and protection from severe frosts provided by bracken in early spring, when an opportunity offers, and while the soil is fairly dry, they are top-dressed with fresh compost, to which a good fertiliser is added. The compost is made firm with a rammer.

It is easy, by an oversight, to seriously injure late-fruiting plants immediately before they are introduced to the houses, and the mistake is especially likely to happen if the old practice of stacking the plants on their sides during winter is followed. I refer to the soil being allowed to get very dry after the plants have commenced to grow. Not only should this be avoided, but as soon as active growth commences the plants should be regularly supplied with liquid manure, otherwise, in the case of very late batches, a good portion of the time when the plants most benefit from being carefully fed will be lost, and no after attention will fully compensate for it. Neglect of another kind may occur from want of thought, and be attended by mischief before the plants are housed from leaving them exposed to frost, so that the flower buds become frozen through. This may happen at an early stage of the development of the flower spikes, and before the inexperienced cultivator might realise its possibility. I have known much injury to be done in this way, and, unfortunately, it is invariably the earliest or crown blossoms that perish, and, consequently, those that would have produced the earliest and finest fruits.

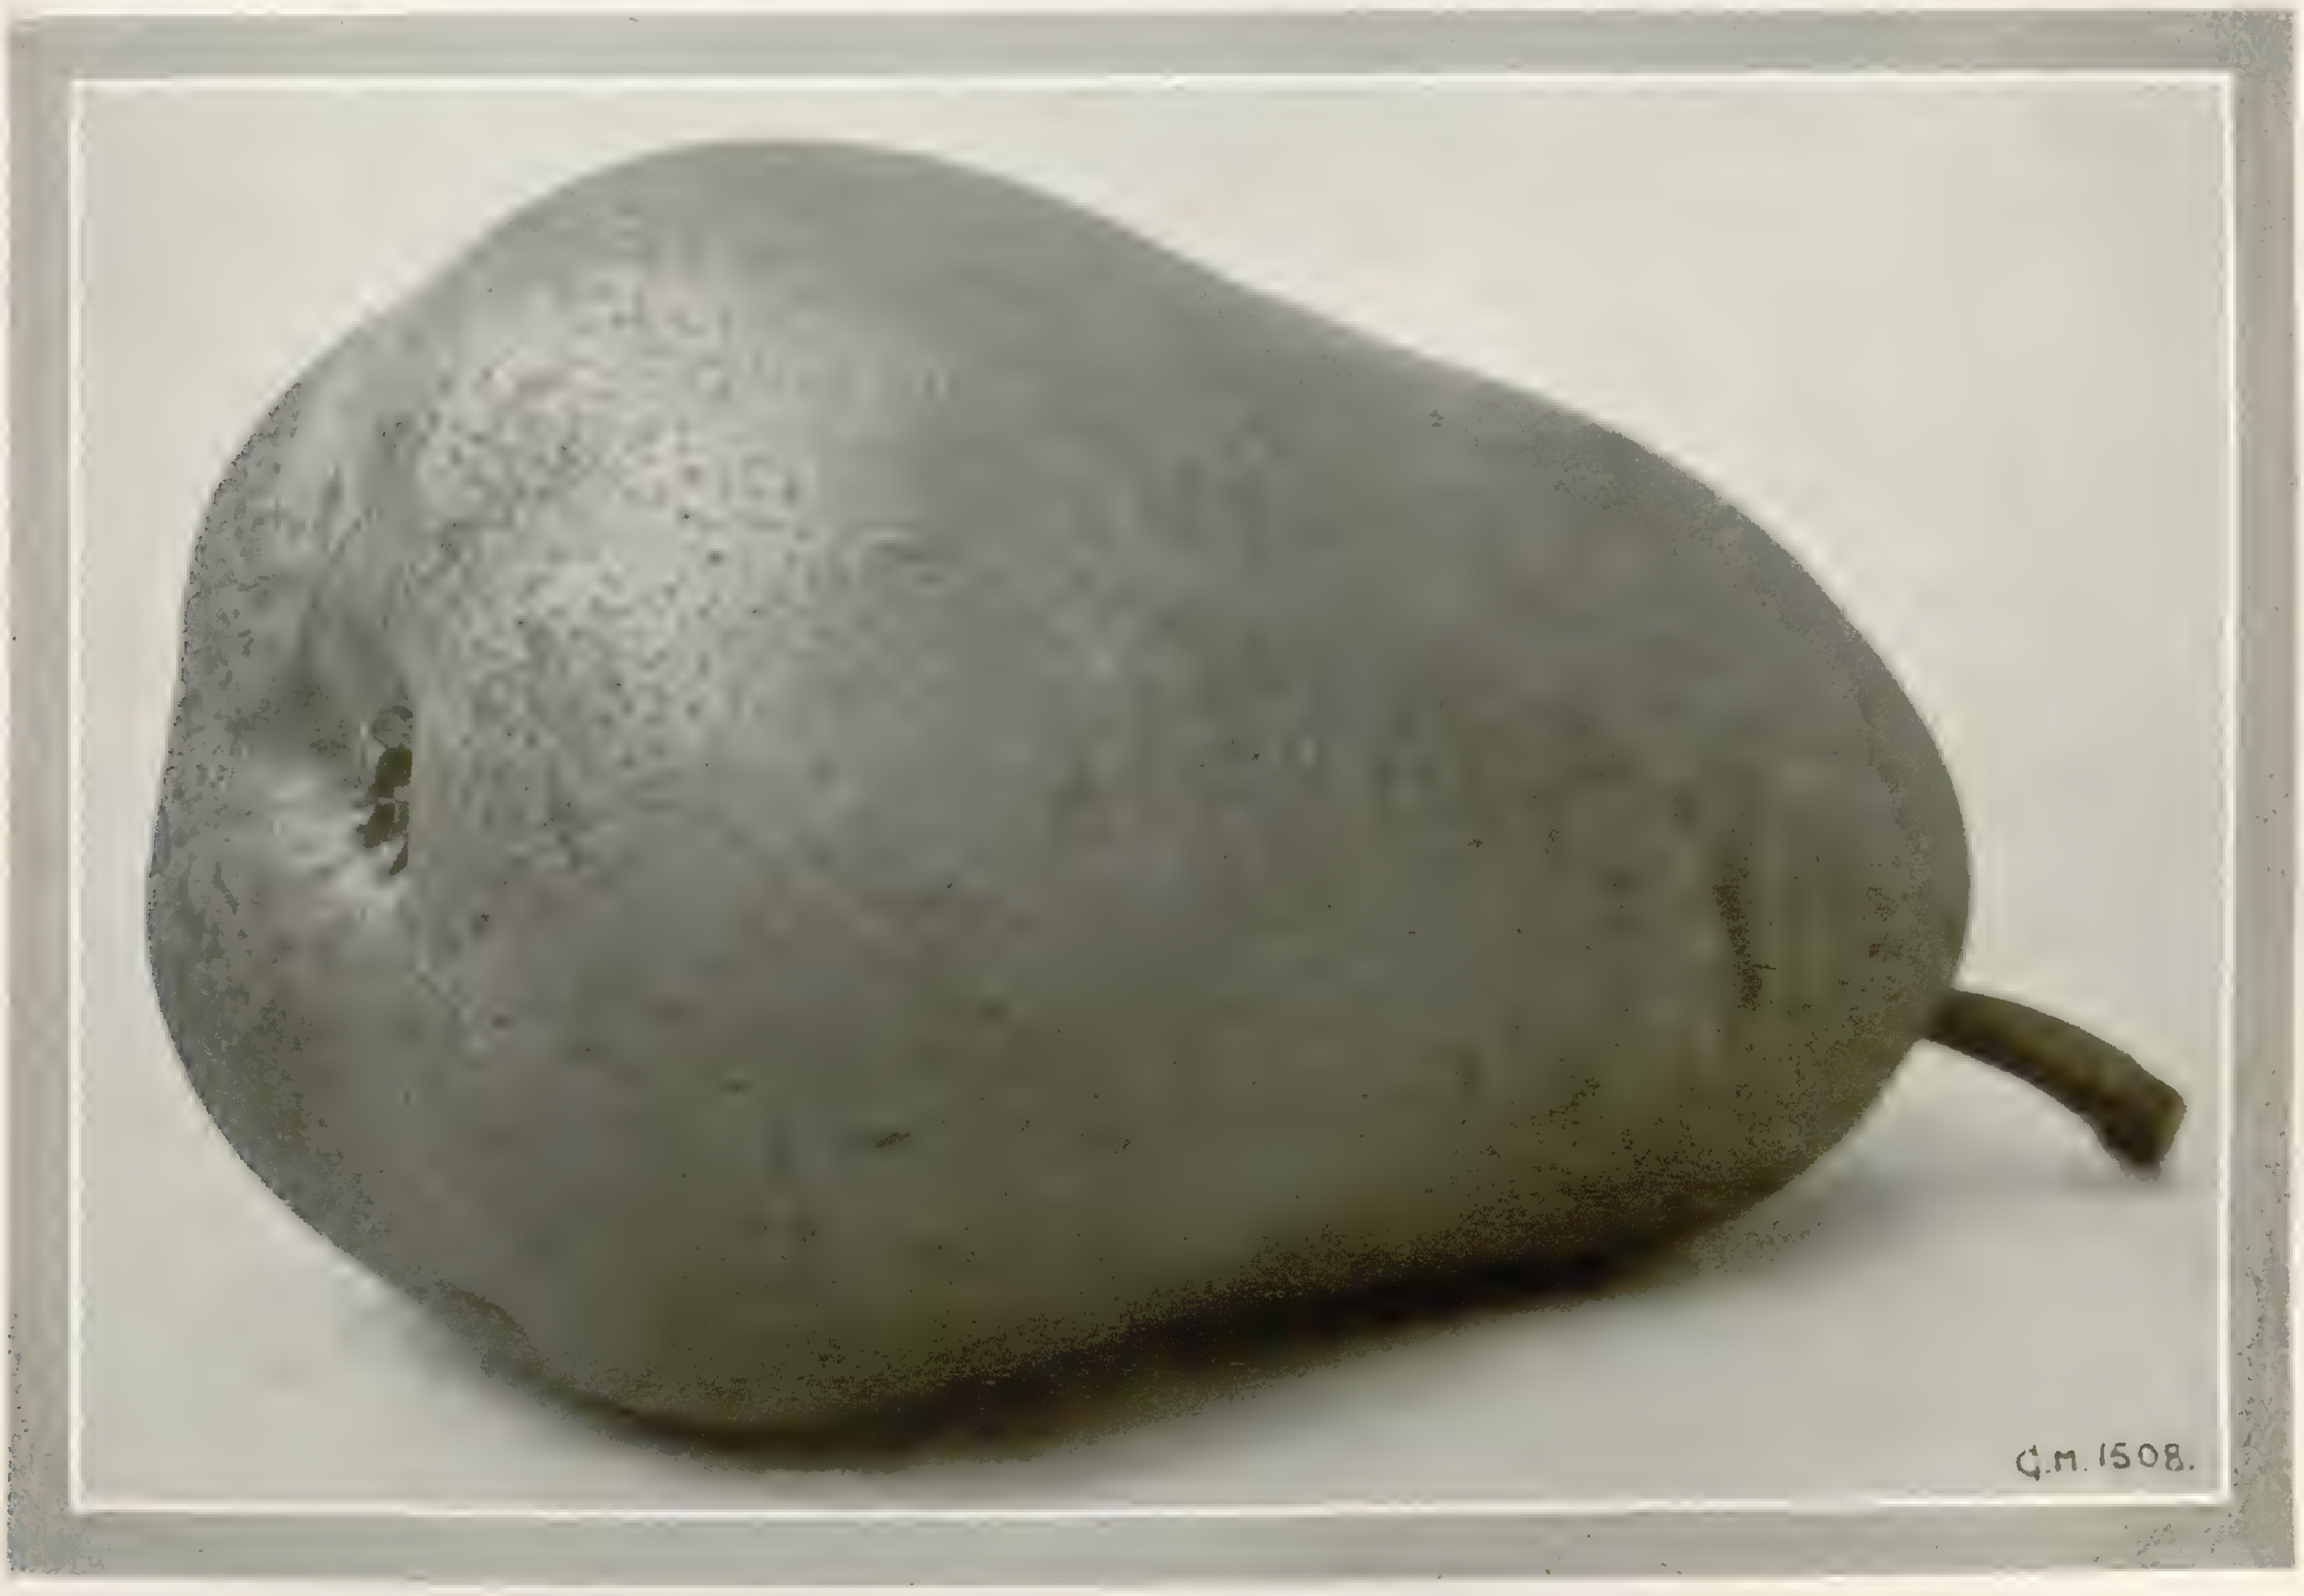
The sun's power being considerably greater at the time these late crops ripen than is the case with early crops, it is not necessary to grow the plants in the most sunny positions; indeed, they can be managed much better in houses or pits that possess eastern or south-eastern aspects than they in those that face due south, and under such conditions. From plants that have been left in open quarters until their flower buds are about to expand, a supply of excellent fruit can be quite easily obtained to couple up the earliest fruits produced under the most favourable conditions outside. Moreover, in houses placed in these positions there is less labour required in watering than is the case under other circumstances, which in itself is a matter of consequence, and red spider is correspondingly less troublesome.

It is a mistake to think that late varieties only are suitable for affording late supplies of strawberries from pots, as at least some of the most early and second early varieties, such as Royal Sovereign, Vicomtesse Hericart de Thury, and President are among the best for the purpose, and, except for the sake of testing new varieties, we have for some years past grown for pot culture no other than Royal Sovereign, and it will take a remarkably good variety to displace it. This variety's only failing is its liability to become somewhat weakened in constitution by attacks of leaf spot, and this we have minimised by changing our stock and securing fresh plants from a considerable distance, and we hope to exterminate the malady by spraying with liver of sulphur solution, or with Bordeaux mixture, as recommended by the Board of Agriculture in these pages.

T. Coomber.

PEAR BEURRE FOUQUERAY.

A pear that does not seem to vary so greatly with season or position as many of the varieties in cultivation is Beurre Fouqueray, and it possesses the additional and very useful merit of being a good grower and cropper under all of the several systems of training adopted for pears. It is an October pear, of good size and attractive appearance, its green skin changing to yellow-green as the fruits ripen. The white, melting flesh is very juicy and refreshing, while the flavour, if not absolutely in the first-class, is very little behind that of the few varieties that stand pre-eminent. An excellent garden pear, its merits were acknowledged some years ago, notably when, in 1895, the Royal Horticultural Society's Fruit Committee granted it a First Class Certificate an honour few pears have received. In the matter of growth Beurre Fouqueray is in no sense gross, and, as the branches form fruiting spurs freely along their length, the variety is especially suitable for small gardens and for amateurs. As in the case of Williams' Bon Chretien, the fruits last over a rather short season, hence many trees are not desirable in a private garden.



PEAR BEURRE FOUQUERAY.
A highly-flavoured October pear, with yellow-green skin.

HARDY PLANT CHAT.

◆

Campanula pulloides.

The pulla-like bellflower is a handsome little plant, which, unfortunately, has some of the "miffiness" of its ally, or, rather, one of its parents, C. pulla. In some gardens this little gem is far from satisfactory, and cannot be persuaded to flourish, and is frequently lost if not propagated annually and a little plant or two kept in a frame for purposes of replacement. The same difficulty presents itself with C. pulloides, and this is probably the cause of its remaining so comparatively high in price, seeing that it has been several years introduced. I believe it first originated with Mr. T. H. Archer-Hind, at Coombe-Fishacre, where so many good hardy plants first saw the light, but there is a Kew variety, in all likelihood of the same parentage, which is even finer than the little Coombe-Fishacre one.

Either is a charming little bellflower, with dark purple bells of a larger size than those of C. pulla, while the habit of the plant is graceful, and, after the fashion of its progenitor, pulla. Of its other parent I have no record, but I imagine that a carpatica variety may have been it.

Flag Irises.

In the olden times we reckoned that we had almost reached the zenith of beauty among the flag irises of the same character of Iris germanica and others of the same habit. But we have long left behind many of the lovely varieties we knew well and thought could not be surpassed, and which it was a pleasure to see catalogued in the lists of good dealers. Many of these are yet to be met with, but we are in the midst of a flood of new varieties raised by hybridising several sections, and those which have been shown in London and elsewhere have given great delight to all who saw them. It would be interesting to know how many of these are the results of the work of Mr. George Yeld, of York, who worked among these irises long before Sir Michael Foster entered the field, and gave us so many lovely flowers which are now finding their way into the market, and thence into the gardens of lovers of the iris. I had once the pleasure of a long chat with Mr. Yeld in his garden at Clifton Cottage, York, and saw some of his work with irises and other flowers, such as lilies. Most of his new irises were sent south to be flowered and grown on, and but few of these have been distributed with his name accredited as that of the raiser.

Other raisers, such as Mr. Caparne and Sir Michael Foster, have sent out many charming things, and I should like to hear more of Mr. Yeld's varieties. As for the Caparne and Foster varieties, it is not too much to say that they are—most of them at least—very lovely, and that they show in the highest degree the beauty inherent in by far the greater number of the irises. Readers who pay a pilgrimage to the next Temple Show may expect to see many of these new irises, such as have charmed a number of us on former occasions.

The illustrations of the bed of Iris florentina in the Iris Garden at Kew and the bold group of the handsome variety of I. variegata in the same garden, indicate in no uncertain manner the effectiveness of the Flag irises during their season of flowering.

GROUP OF IRIS VARIEGATA AUREA IN THE IRIS GARDEN AT KEW.
A beautiful variety of the Germanica group, with large, rich chrome yellow flowers.

Lithospermum prostratum Heavenly Blue.

Personally I don't approve of a varietal name such as "Heavenly Blue," which has too much of the American nurseryman's nomenclature in its sound, but it is for those who are responsible for it to justify its choice. In colour there is certainly much justification for it, and it is in all respects a beautiful plant indeed. It is brighter than the usual prostrate Gromwell, Lithospermum prostratum, and is of a blue which fascinates everybody. For those who have so long loved the old one it seems difficult to brook a rival, and many of us will still cherish the deeper blue of the one we have known for so many years, and which is ever prized as a plant for the rockery.

Incarvillea grandiflora brevipes.

Had we never known the fine Incarvillea Delavayi, or the dwarfer and exquisite Incarvillea grandiflora, we would at once have taken to our bosoms (metaphorically, of course), the fine I. grandiflora variety brevipes, shown first, I believe, as I. Bonvaloti. This has a flower partaking of the style of Delavayi in its shape, and in its habit of growth, but with the foliage of the character of I. grandiflora. The blooms are of a deep, almost crimson hue, and the plant comes intermediate in height between the two other species.

It is a native of a higher region in China than I. grandiflora, and should therefore be hardier than that fine species, although we do not seem to have much to complain of in I. grandiflora with respect to this quality of endurance. A good group of any of the three incarvilleas in cultivation is a feature worth owning a one's garden, but I confess that I do not like either of them on a rockery, where their appearance seems out of harmony with the spirit of a rock garden. But we have not all the same tastes, and, with flowers, as with other things, as the saying goes, "What is one man's meat is another man's poison."

The King's Spear.

There is one plant which I would like to commend to the notice of the seedling raiser and the hybridist, and which, I believe, would eventually yield some excellent results. This is the King's Spear, Asphodelus ramosus, which does not seem as yet to have been the subject of much, if any, consideration by hybridists. There is surely here a field of operation for someone, and they suggest themselves as suitable subjects for use in hybridising with the asphodelines, which are surely close enough to use as pollen or seed bearers to employ with Asphodelus ramosus. Points to be aimed at are variety of colour, length of spike, and size of individual flowers. The king's spears at present appear to have too tall a stem for the shortish spike of flowers, yet it is an effective plant when seen rising among other flowers in the hardy plant border or in the wild garden. We seldom see it planted in quantity, yet a group of a hundred or more spikes rearing their flowers among dwarf shrubs or herbaceous flowers is not to be despised in many ways, old-fashioned though the plant is, and it is not much grown nowadays. It always likes a good soil, and one with a fair share of moisture appears to be preferable.

S. Arnott.

Pansies.—To obtain plants for flowering this season, the seed must be sown without delay. Pots or pans are suitable, and should be filled with a mixture of loam, leaf-soil, and sand. An important point is to sow the seeds thinly, as when the seedlings are very thick damping often occurs. The seeds quickly germinate in a temperature of 65 degrees, and immediately this takes place the pots or pans should be placed as near the glass as possible to induce sturdy growth. After a week's growth they should be removed to a warm greenhouse, transplanting the seedlings into boxes when large enough to handle.—E. C. P.

A FINE BED OF IRIS FLORENTINA AT KEW.

Flowers white, falls tinted blush or lavender, fragrant, a fine iris needing the same care and treatment as the bearded or Germanica varieties.

GRAFTING TREES AND SHRUBS.

Though, whenever it can be avoided, it is better to propagate trees and shrubs by methods other than by grafting, there are instances where other means of increase are out of the question, consequently this branch of propagation requires to be understood by those who are responsible for the upkeep and increase of collections.

In the case of species which cannot be rooted readily from cuttings, and when fertile seeds are not easily obtainable, it is often possible to raise a stock by grafting on to an allied species, while where varieties are concerned which do not come true from seeds there is often no other means of increase available. Weakly plants are sometimes strengthened by union with a strong-growing stock, and it sometimes happens that a shy-flowering species is made more productive of bloom if grafted than when grown on its own roots. The raising of stock in this manner may in many instances be carried on more expeditiously than when other means of propagation are employed, and this results in the plants being put on the market at a cheaper rate than would otherwise be possible.

So much for the advantages attending grafting. Looking in other directions we find that grafting is sometimes carried to excess, and trees and shrubs are increased by this means when there is no necessity for it, and other means of propagation would be attended by results which would, in the long run, be more satisfactory.

A fertile source of complaint is the grafting of various conifers, and the complaints are made with reason, for in the case of certain species, particularly pines, firs, and spruces, it rarely happens that a good example can be grown from a grafted plant. The most satisfactory results are obtained from the use of terminal shoots as scions, but only too often side branches are used. From these it is very difficult to obtain a clean, upright leader with a uniform development of branches, the tendency almost always being for the young trees to grow one-sided, whilst the leader remains weak. The defect may sometimes be remedied by cutting the tree back once or twice to try and induce a strong upright shoot to appear from a dormant bud. Varieties of Cupressus Lawsoniana and other species are frequently raised in the same way. They are usually more satisfactory than the kinds alluded to earlier, but require attention to pruning during their early years or they will not form shapely specimens. The more distinct varieties of the common yew are frequently grafted on to stocks of the type, for plants raised in this manner attain a saleable size more quickly than those raised from cuttings. The chief objection that can be raised to grafted yews is that suckers are very liable to grow from the stock, and if their removal is neglected for a short time the scion is weakened.

The grafting of conifers is usually carried out in a warm propagating house during early spring, the stocks having previously been established in small pots, and placed in heat a fortnight or so before working, in order that growth may be excited and the sap, made to run freely.

The grafting of garden varieties of deciduous trees is practised because there is really no other way in which stocks of some kinds can be raised, for both cuttings and layers are out of the question. Whenever it is possible, however, grafting should give way to another means of propagation. The selection of a suitable stock is often a matter of great difficulty, and it not infrequently happens that the stock increases in girth more rapidly than the scion, or vice versa. This leads to gouty-looking swellings, which are most objectionable to the appearance of the tree, especially when they occur several feet above the ground. As a rule, the best stock for a variety may be considered to be the type of the species to which it belongs, but when one species has to be grafted on another then the cultivator has to take his chance among other species, and find the best stock by experimenting. It is usually objectionable to graft trees several feet above the ground, except when it is for some special purpose; rather let the union occur as low as possible.

When grafting fruit trees it is usual to select scions or grafts from the previous year's wood, but this kind of wood is not always satisfactory in the case of ornamental trees. Two, or even three, year old wood frequently stands a greater chance of success than that which is younger. As a rule, grafting is best done indoors in a close and moist house between February and April, though some kinds of trees may be successfully dealt with out of doors. Anything which takes a period of six or eight weeks to form a good union should be covered with grafting wax or clay over the matting with which scion and stock are bound together. Plants which are grafted indoors, and stood in a close case, however, which take quickly, require no wax. Roses usually take very quickly, but they must be kept in a well-heated and moist structure, and subject to no violent change of temperature. They must likewise be kept shaded from bright sunlight.

Rhododendron grafting forms an important item in many establishments, for many thousands are dealt with annually. The work is done between January and April, and R. ponticum, previously established in small pots, is almost always used as a stock. The saddle graft is generally selected for a safer union is formed than when the side graft is used. When selecting scions it is always advisable to take shoots without flower buds, for a stronger growth appears. To obtain stocky plants it is necessary to prune back the leading shoots during the first two years.

Though it is usual to graft on to stocks formed of young seedling plants, it sometimes happens that pieces of root form a more satisfactory stock. Daphne mezereum roots, for instance, are used for rare kinds of daphne; cytisus and laburnum roots for plants like Cytisus scoparius Andreanus; Clematis vitalba roots serve for garden varieties of clematis; and Wistaria chinensis for the white variety and for W. multijuga. These, of course, cannot be potted up previous to being worked but whenever it is possible the stocks should be established in pots, for it will be found that a great advantage is gained by having them well established and well rooted.

Any stock which appears to have a tendency to produce a large quantity of suckers should be cast aside, for it will always cause annoyance. It is a good plan when potting up the stocks in the first instance to look them carefully over and remove anything which appears like a branch growth, taking care to remove it bodily, and not leave a quarter of an inch of the base.

W. Dallimore.

Box Edgings may be now put in order, filling up all vacancies that occur. Where new edgings are to be made, the work should be carried out thoroughly, making the ground perfectly level, and treading the soil firm.—E. C. P.

SLUGS AND SNAILS.

When making a selection from the various nurserymen's catalogues of flowers or vegetable seeds for sowing, one is wont to speculate on the number of precious seedlings that will fall a victim to the onslaught of the slug or snail. There can be no doubt that if the wet spring seasons experienced during the past two years are followed by a third, equally moist, the ravages of these pests will prove still more serious to garden and field crops; for it is a well-known fact that they increase considerably in numbers in keeping with the number of wet springs and summers which follow in succession. It is no uncommon sight to see acres of seedling mangels totally destroyed in the course of a few days. Growers of sweet peas know only too well how difficult the cultivation of these plants is in small gardens, due solely to the ravages of these pests; they are unfortunately more trouble than birds, as the latter can be scared away by means of a few strands of black cotton or thread.

It is well to note the difference between these two pests, and the representatives of each class. Slugs belong to the Limacidæ, and do not possess any external covering or shell, but there is nevertheless a small, flat, shell-like plate hidden under the skin in the front region of the body. Snails, on the other hand, are readily distinguished by a large protective shell, into which they draw the whole of their body when alarmed or at rest; and further protection is provided by means of a hardened plate which fits securely over the entrance or opening into the shell. As with fungi, it is very difficult for the amateur to distinguish between those which are injurious, and those which possess beneficial qualities, and so the cultivator wages war against every form of animal life resembling the form of a slug or snail.

The common grey field slug is particularly noticeable in many gardens, and usually breeds in large numbers under old rubbish heaps; and for this reason alone—if for no other—it is never a wise plan to allow large quantities of useless garden refuse to accumulate unless it has some direct value as manure, and even then it ought to be specially treated by making it into a compost heap or heating by fermentation so as to destroy as many of the eggs of injurious insects as possible. Rubbish which does not readily decompose is best set fire to and the ashes used. It is estimated that a single slug will lay as many as 500 eggs during one season; thus, it is easy to understand how whole seedbeds can be cleared of their occupants by these dangerous pests. Often a warm shower in spring causes the ground to be literally covered with slugs, and the question occurs, where do they all come from? An examination of the surface soil during the drier parts of the day will reveal them securely nestled away under small stones and the coarser particles of earth.

The root-eating slug is another very destructive species which lies buried under the surface soil during the day time, from whence it makes an exit at night, and feeds freely on any green vegetable that may be within its reach. If one suddenly switches on a light, as from a bull's-eye lantern or an electric torch, these night prowlers can be seen busily at work, and if not too numerous may be collected, although it is wonderful to note the rapidity with which they can make their escape. The remedy usually advocated is that of dusting with freshly-slaked lime or other caustic powder. It is perfectly useless to give a single dressing, as the slimy matter excreted easily resists the burning or drying effects produced by one or two dressings; but if such dressings are repeated the flow of slime becomes lessened, and the animal is taxed beyond its strength, with the ultimate result that the skin becomes parched and inactive, and death follows.

All species of snails are provided with shells, and, as in the case of slugs, they move over the ground by means of a muscular contraction confined to a small area of their bodies. Like slugs they also secrete large quantities of slime, and are very similar in their habits to the former pest, mostly feeding during dusk, except when heavy rains bring them out during day time. Although feeding on the greater variety of plants they have certain preferences, more particularly when there is choice of selection. The large garden snail is most commonly encountered in gardens, and is readily recognised by its large brownish shell, which is covered with a network of closely-woven lines. As cold weather approaches snails, like slugs, make their way towards rubbish heaps or secrete themselves in hedge rows where abundance of shelter is provided. Most of us have watched the industrious thrush searching diligently for these juicy morsels along the hedge-rows or by the sides of garden paths, and when the treasure is secured the bird hastens to the nearest stone, and gives an interesting exhibition in shell cracking, a continuous tapping being indulged in until the desired result is achieved.

The strawberry snail often proves a troublesome pest in strawberry plantations, and seriously damages many of the choicest plants; it also works havoc among violets. The shell is not so conical in shape as in the case of the species mentioned above. There are many other snails that could be enumerated, but as we have already remarked, all slugs and snails are alike in the eyes of the ordinary cultivator, and even the law-abiding snail does not escape the fury of those who may have suffered disappointment and vexation from his harmful brethren.

Apart from dustings of caustic lime and treating rubbish heaps and badly-infested soil with gas lime, I know of no better remedy than that of placing a layer of barley cavings along the rows of peas, and when these become sodden and wet in the course of a week or so provide a fresh dry layer. It is impossible for either slugs or snails to crawl over these finely serrated and saw-like awns. Unfortunately, however, barley awns or "cavings" cannot be readily procured for town gardens. Annuals are often swept off in a wholesale fashion by slugs, and I would advise all growers who are troubled with these pests to sow in pots and plant out; sometimes rings of superphosphate or lime are serviceable in keeping the pests at bay.

J. C. Newsham.

Sweet Peas may now be sown in pots. It is rather a difficult matter to fix exactly on the correct time for sowing, when one wants to exhibit at a particular show, yet the first week in February is usually safe for July exhibitions, and later sowings for later dates. One seed in a small 60-sized pot is ample, or three in a large 60, if grown for planting in clumps. A suitable soil for filling the pots may be made up with half loam and half decayed hotbed material, adding a small quantity of wood ashes, and thoroughly mixing the whole together. A cool greenhouse is a suitable place for them to germinate in, and immediately this takes place they should be removed to a cold frame. Where mice abound a strict watch is necessary to prevent losses.—E. C. Pooley.

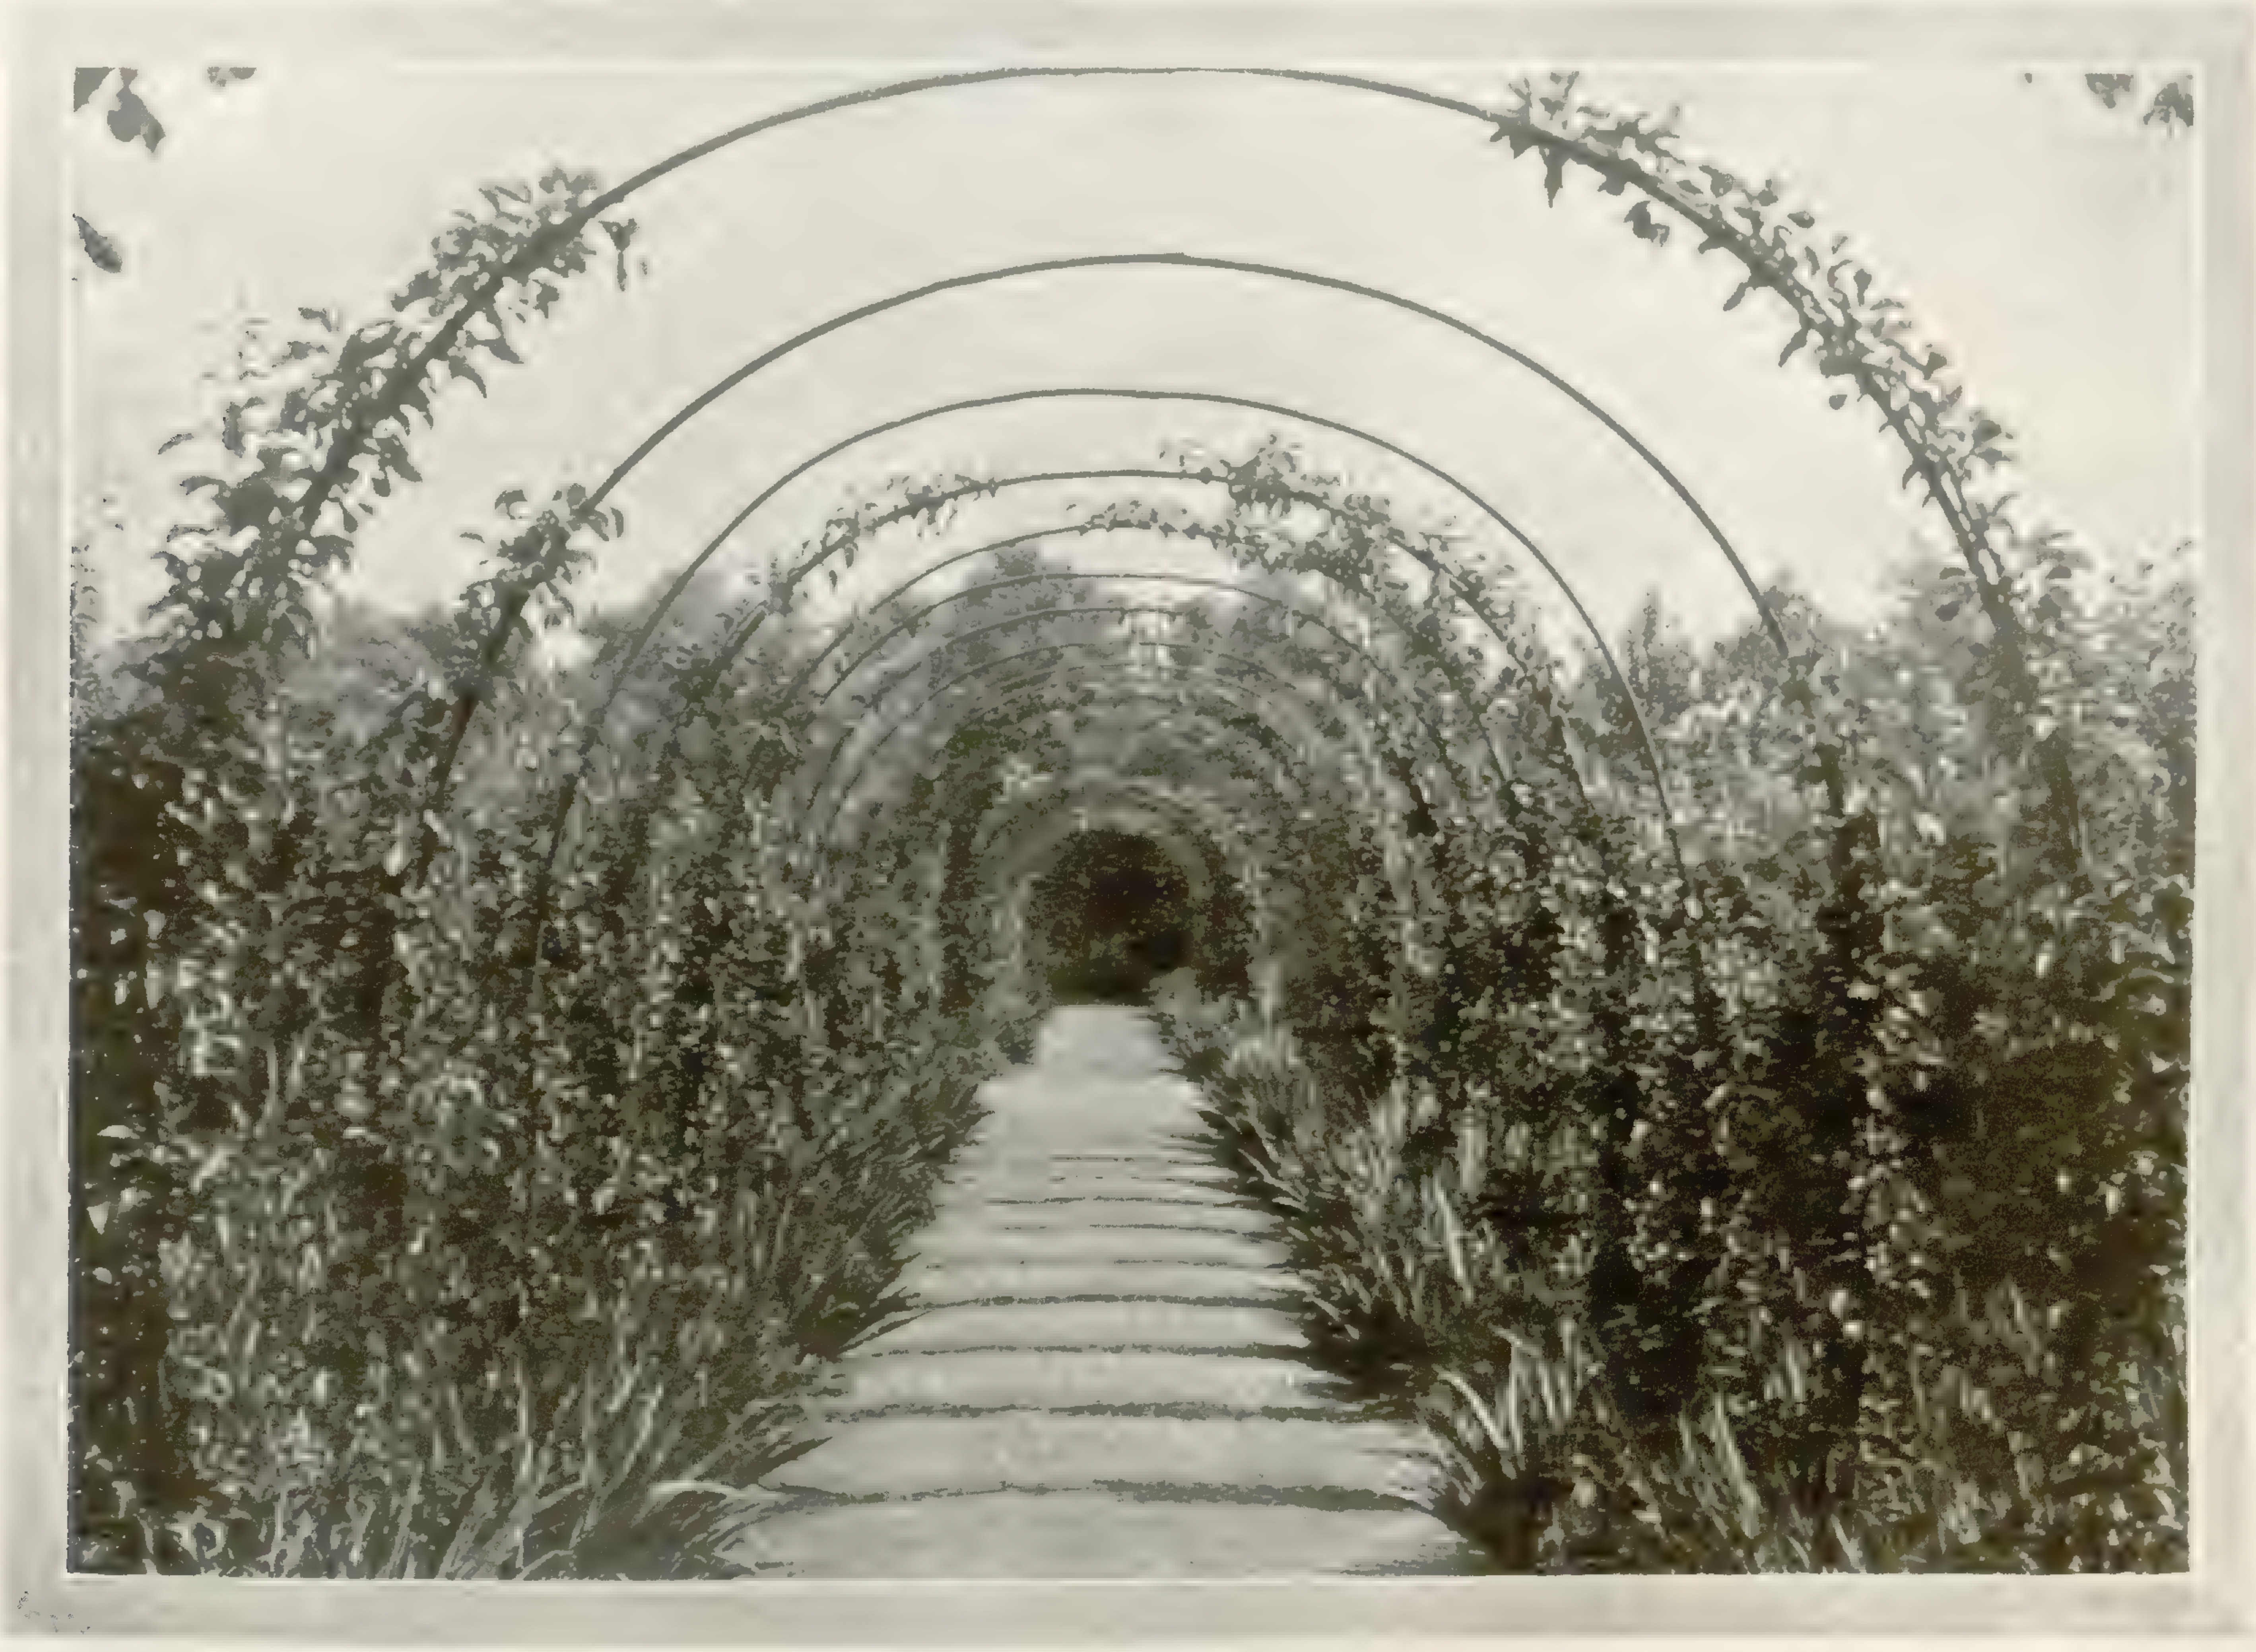
CORDON PEAR TREES ON ARCHES.

The value of cordon pear trees as aids in the maintenance of abundant supplies of choice fruit during the autumn and winter months is recognised by fruit growers generally, and in not a few gardens they form a feature of much interest, and a high degree of utility. They have the advantage of coming into bearing quickly, and as a much larger number of varieties can be grown in a given space than when fan or horizontally trained trees are planted, it is possible to have a supply of ripe fruit extending over a longer period than would otherwise be the case. Usually these trees are trained to the walls enclosing the kitchen garden, and in a general statement of the case it must be said that no better place could be assigned them. The advantages of a sunny wall are great, more particularly in northern districts, because of the assistance the warmth of the wall is able to render in bringing the fruit to maturity and ripening the wood. There are many gardens in which it is not possible to obtain a full measure of success with cordon pear trees unless they can be given the shelter of a wall, but there are unquestionably immense numbers where splendid crops can be obtained from cordons that are grown without such aid, a fact that should be taken advantage of where the wall space is limited, or non-existent. The best indication of the possibility, or otherwise, of growing cordon trees successfully away from a wall is the productiveness of the bush-grown and pyramidal trees in the open quarters. If these thrive, and bear satisfactory crops of fruit, the cordons may be planted with the assurance of their yielding good crops.

This being the case, it appears highly desirable that both amateurs and professional gardeners who are desirous of augmenting the supplies of pears might with advantage consider whether it would not be to their advantage to plant cordons more largely than has yet been the case. It will be readily conceded that there are few establishments where additional supplies of pears of high quality would not be acceptable, and the number of gardens is probably small that would not have their interest and attractiveness enhanced by the judicious planting of cordon trees in the open. There are various methods of training that may be adopted with success, and those who prefer elaborate structures have full opportunities for the exercise of their taste. A simple method of training, such as that herewith illustrated, will appeal to many readers, and not without justification, for it has the advantage of being inexpensive, and of enabling the trees to enjoy to the full the advantages derived from exposure to sun and air. As will be seen, the trees are trained on a series of iron arches, which are of sufficient strength to support the trees and their crops without being unduly heavy. The arches are placed about seven feet apart, and at this distance the trees do not injure by their shade the other subjects growing alongside the walk or interfere with the enjoyment of the walk by visitors. At this distance apart the effect produced by the trees is remarkably good, and widely different from that of the close framework which finds favour in some gardens.

The fruits can, of course, be readily seen, and those who are interested in pears will derive much pleasure in watching their development, more especially during the later stages. The arches, it should be added, are about eight feet high, so that it is possible to pass along the walk without inconvenience, a point of considerable importance to the fruits, as well as to the headgear of visitors

The accompanying illustration depicts a portion of the pear walk in the gardens of The Pleasaunce, Overstrand, the marine residence of Lady Battersea, which are not less noteworthy for their fruit trees than for their many beautiful ornamental features. The iron arches were manufactured and erected by Messrs. Boulton and Paul, the well-known horticultural builders, of Norwich, and afford abundant proof of the great excellence of the firm's work in this branch of its activities.



A SIMPLE AND EFFICIENT METHOD OF TRAINING CORDON FRUIT TREES.

LIBRA PEACH.

Your note to my letter printed in your issue of January 21, generously mentions the A.M. bestowed by the R.H.S. on the Libra Peach, but, nevertheless, calls for reply. The first fruit I ate of Libra Peach was excellent. It was sent to me by the late Mr. R. D. Blackmore, from a standard tree growing in the open in his garden at Teddington. At the time, I noted down: "Rich, brisk flavour, and very juicy." Wherever the soil is of good quality, with sufficient moisture and sun-warmth, I have no doubt this peach comes first-class in any position and in any form of tree—wall or no wall.

Hampton. WILL. TAYLER.

The Winter Jasmine as a Single Specimen.—Apart from its beauty when trained to a wall, the winter jasmine forms a delightful single specimen, either on the grass or in a prominent position in the shrubbery border. If the main branches are secured to a good stout stake until the required height is obtained and then the secondary ones are allowed to dispose themselves at will, they form an exceedingly graceful specimen, which, when thickly studded with yellow flowers, suggests at a little distance a fountain of gold.—W. T.

HARDY BAMBOOS.

During recent years bamboos have been largely planted in numerous gardens in this country, and it has been found that many of them are perfectly hardy in our climate. They are now generally recognised as important subjects for garden decoration, and by careful grouping and arranging they produce a decidedly tropical appearance. Bamboos might appropriately be described as giant grasses of graceful habit, some of them almost reaching twenty feet in height.

Growing here in the gardens at Batsford are some fifty kinds, some of which have been established over twenty years, and are enormous plants, both in height and circumference. Situated on the borders of the Cotswolds, at a height of 800 feet above sea level, our climate is by no means a mild one, but nevertheless the bamboos flourish almost as if they were growing in their native haunts. They will succeed in any locality where there is a good depth of rich loamy soil, and where they are well protected from the cold winds, for they suffer more from the latter than from sharp frosts in winter, which seem to have little or no effect on them. In exposed districts it is necessary to erect screens to protect them from the wind during the winter and spring months, or the foliage will quickly be turned brown round the edges.

Where the soil is sandy, or at all shallow, special treatment is necessary before planting is commenced. In such cases the best plan to adopt is to remove the natural soil to a depth of fully two feet, and in its place put a mixture of good loam and cow manure; then the plants will usually be found to thrive. An annual top-dressing of good manure is beneficial, and should be applied during the spring, especially if the plants are showing signs of exhaustion, as it not only feeds them but helps to guard against the effects of drought later on.

Mention of a few of the best bamboos may be of interest, and of these Arundinaria anceps is one of the most charming for general ornamentation. It grows to a height of fully ten feet, and forms an admirable specimen; overhanging the banks of a stream, associated with such subjects as spiræas, Senecio clivorum, and S. Wilsonæ, it is an object of much beauty. A japonica (Metake) is a vigorous-growing kind, while A. nitida is very graceful, and as a single specimen on the lawn is difficult to surpass. There are two forms of A. nitida in cultivation: one is more erect than the other, but the drooping form is, in my opinion, the finer of the two, as it keeps its foliage better during the winter than the erect one, which at this time of the year is apt to become rather bare. A. aristata does not appear to be so well known as its merits deserve. It is a free grower, of fairly erect habit, and its branching stems are tinted with purple; altogether a desirable bamboo to plant as a single specimen in a prominent situation.

A. Hindsi is tall growing and erect, with dark green foliage. A. metallica, a rather dwarf species with very large leaves is suitable for massing. A. Veitchi and A. pygmæa are both dwarf, and can be planted on the rock garden. A. Fortunei is a free grower, and suitable for the borders of the shrubberies and walks in the wild garden. A. auricoma is a prettily variegated bamboo, which may be effectively utilised in the ordinary flower borders.

Bambusa palmata, with bright green leaves, is very effective for massing. B. quadrangularis is a free grower, and has square stems, with deep green foliage. B. Laydeckeri and B. marmorea are both desirable kinds.

Phyllostachys aurea is a handsome species, with tall branching stems, and makes a very striking bed. P. fastuosa attains a height of fully seventeen feet, and is very striking in appearance. It looks well associated with the more drooping kinds. P. flexuosa is an ornamental species, but not so tall as the foregoing. P. Quilloi is a handsome bamboo, and sometimes reaches nineteen feet in height. It is a very fast grower, and will complete its total height in one season, sometimes growing as much as nine inches in a day. Unfortunately a large clump flowered in these gardens last season, and also a plant of P. nigra, with the inevitable result. P. henonis is a charming bamboo, with slender stems thickly set with small tapering leaves. P. violascens has dark violet stems; it is a very handsome bamboo, and is quite hardy in these gardens, although one hears reports of it being tender in some localities. P. viridi-glaucescens is one of the handsomest bamboos, with tall arching stems, often attaining a height of eighteen feet.

J. Gardner.

THE CHOICE OF HARDY PERENNIALS.

In the modern garden hardy flowers of perennial nature enter largely into almost every scheme. The whole trend of modern gardening away from formalism has been assisted at every point by those same perennial subjects. Many a gardener today can well remember how, during the reign of "summer bedding," hardy plants were relegated to the kitchen garden and shrubbery, or left to the fostering care of the cottage folk of the country villages. Since then all has changed, and the hardy perennials have come to their own, and enjoy to the full the attention of the florist, and the appreciation of the garden lover.

I do not advise indiscriminate planting of any, or all, forms of hardy plants, but would rather advocate a careful study of both positions and plants in every possible case. To secure the best effects is surely an ideal to work for, and nothing should be allowed to detract one's attention from this point. With reference to border planting, one should always endeavour to emphasise certain plants above all others, thus compelling and rivetting attention until the observer is enthused by the attraction of the subject, his mind and eye turn to the lesser plants in the scheme.

If wished for, each of the "flower months" of the year could, in their turn, be devoted to a special flower, and a few which are suited in their season for this particular type of display are May-flowering tulips, delphiniums, irises, kniphofias, lilies, montbretias, campanulas, chrysanthemums (both of the maximum group and the typical chrysanthemums of early autumn), Michaelmas daisies, and phloxes. Then, again, even when one settles upon the groups of perennials to be used, there is the additional care of choosing varieties, and in many classes of plants this is an important detail.

Chrysanthemum maximum, for instance, should be chosen carefully. If a variety is required which is dwarf in growth, and long-lived in blossom, then choose Mrs. Lowthian Bell. If height and bold masses of foliage and bloom is necessary, then King Edward VII. or Moonlight will give fine results. Delphiniums, again, need close attention, for daintiness and continuous blossom let me recommend Persimmon, Bella Donna, Bella Donna semiplena, and others of the same lightsome character. Bold planting calls for bold varieties, and here one can grow so many of those grand new seedlings which are becoming more numerous as the years go by. Varieties with clearly defined colourings and large blossoms, well set upon good stems, should be carefully picked out, and contrasted for effect. Of late years no dark variety has claimed more attention than King of Delphiniums, as in foliage, habit, and colouring it is good.

I might go on to speak of varieties, advising the eradication of certain lilac-purples and slaty shades of Phlox decussata, and the passing over of some of those ultra-dwarf small-flowered montbretias in favour of newer and better varieties, which are far more pleasing. Kniphofias, or torch lilies, should be chosen for colour. If you are going to plant these pick out telling varieties for distant effects. Choose John Benary, R. Wilson-Ker, R. C. Attourtit, and Beacon, Red-cap, and Lemon Queen, and others of similarly characteristic colour shades.

A few words concerning floral combinations may be of interest to readers. Try the effect of a few fine masses of tritomas, or Lilium tigrinum splendens, coming out of a butterfly mass of Gaura Lindheimeri. Or tall scarlet gladioli rising amid the same exquisite subjects. Delphinium Persimmon, or Belladonna, is charming grouped with light-growing forms of Chrysanthemum maximum, pale pink single pyrethrums, or a mass of soft yellow anthemis. German irises should be intersected by drifts of Myosotis sylvestris and M. dissitiflora, or Cerastium tomentosum. Pæonies, phloxes, and other subjects with large heads of blossom should be carpeted with light-growing misty flowers, such as heucheras, tiarellas, Saxifraga umbrosa, Thalictrum anemonoides, and similar dainty subjects. The blue thistles, like Echinops ritro, and the eryngiums are beautiful rising out of a mass of white blossoms. Here again Gaura Lindheimeri or chrysanthemums like Robinsoni are splendid, grouping them thickly enough to cover the ground space.

Tall blue campanulas are delightful companions to the many fine forms of the Foxglove (digitalis), the tall waving flower stems, "daintily bell clad," being common to both, while around could be grouped golden aquilegias or white pyrethrums. Lilies, in some cases, are best grouped alone, save for a few lowly plants for covering the soil at their feet. Madonna lilies are an exception, however, and the tall white blossoms look well coming out above the usual plants of the herbaceous border.

Varieties of Lilium tigrinum can be grouped around with lighter-habited blossoms, preferably either white or blue. Golden asphodels, rising from a bed of cherry-coloured potentillas or blue and white platycodons would make a delightful group. Isatis glauca, with its golden showers of blossom, can be grouped with many plants. Campanulas in any shade of blue or white are good companions, but a better would be a serried mass of Delphinium Belladonna or Persimmon grouped around the isatis. White composite flowers, anything of the daisy type, also blend well with the isatis. The double gypsophila should be included in all plantings, if possible, and as it is so late flowering, it should be grouped near such blue flowers as the delightful Scabiosa caucasica, or Aster bessarabicus, or intermingled with glowing heleniums golden helianthuses.

P. S. Hayward.

A FAMOUS SCOTTISH NURSERY.

Who was better known or more highly esteemed among that class whom we sometimes call "Florists of the Old School" than the late John Forbes, of Hawick? For forty years he carried on his work of love among florists' flowers at the Hawick Nurseries, and the results of his skill as a raiser and grower of phloxes, pentstemons, antirrhinums, pansies, and all the other flowers dear to the hearts of Scottish florists, are seen in every garden, and his name is a household word wherever dwells a true gardener. Hawick, the borough of ancient fame, is more famous to-day by reason of the work of John Forbes, and the nurseries, now under the able control of his son, are annually visited by hosts of horticulturists from far and near, and there is always something worth going to see.

It was just when summer was passing, and autumn approaching, that the writer spent a most enjoyable afternoon looking round and taking a few notes. Phloxes and pentstemons were still masses of floral beauty, and at the first glance I realised that I could do no more than take the names of a few of the very best. In adopting this course, however, I soon found I had made trouble for myself, for, extensive as the collections are, no second-rate varieties find a place, and where all are extra good it is well nigh impossible to select the best.

However, this much may safely be claimed, every one of the varieties noted down is a thoroughly good one, and among the phloxes no grower need hesitate to plant Mrs. Oliver, a beautifully formed flower, clear pink, with white eye; John Forbes, a pink variety, that worthily bears the name of the founder of the nursery; Lady Tate, which bears deep pyramidal trusses of pale lavender flowers; Mounet Sully, distinct orange, with a conspicuous purple eye; Muriel Rogers, soft pink, with carmine eye; and Countess of Dalkeith, a lovely salmon-coloured variety, of rare size and form. These half-dozen are of comparatively recent introduction, and are good as could be wished.

Messrs. Forbes put twenty-one new varieties into commerce last year, and among these are one or two of strikingly distinct colours. Tristran Bernard is a rich purple-violet; Jean Rameau, white, bordered with lilac; and General de Gallifet, fiery scarlet of exceptional intersity. More good things will be distributed this season, one variety worth looking for being named A. J. Macself, rosy-cerise with a deeper eye, fine pyramidal trusses, and flowers of great size.

Pentstemons, needless to say, are grown at Hawick in great quantities, and to the highest possible state of perfection. Every show-goer is familiar with the remarkable spikes exhibited by the firm at the Temple and Holland Park shows, and at York, Shrewsbury, Edinburgh, and other important provincial exhibitions, but one needs to witness the glorious blaze of colour produced by the thousands of plants in the open beds at the nursery to realise the full value of these charming and floriferous plants. Tall, sturdy spikes, clothed with huge bells from near the base to their tips, in every conceivable shade of pink, scarlet, crimson, and purple, were at the time of my visit making a display that could scarcely be surpassed at any season of the year by any plant available for British gardens. King George, a new variety for 1911, is of huge size, and of most intense fiery crimson. Marquis of Linlithgow, although older, is one of the finest rose-pinks, with a pure white throat. Gregor Mendel is probably the darkest pentstemon in cultivation, while Lady Forbes is perhaps the best of the pinks with white throat yet raised. Other fine varieties noted were Comte Zeppelin, Crown Princess of Sweden, Prosperity, and Crimson Gem. Newbury Gems, scarlet, pink, and white, are largely grown, and are in great demand for bedding purposes.

The delphiniums were past their best, but there was sufficient evidence to warrant the statement that these also hold the prominent position at Hawick which their noble form and beauty entitle them to. The pansy fancier could wish for no better occupation for passing a few happy hours than in inspecting the many beds of named show and fancy pansies at Hawick. The collection embraces all the varieties the keenest fancier could desire, whilst anyone who wished to obtain violas by the dozen, hundred, or thousand for either bedding or exhibition could have his wants amply satisfied here.

With reference to border perennials few, if any, worth growing are omitted from the collection at the Hawick nurseries, and there are also alpines, hardy ferns, and rockery shrubs in great variety. On a rockery near the entrance the lovely Dianthus Napoleon III. was flowering in characteristic profusion. Antirrhinums asarina, glutinosa, and sempervirens, Lithospermum prostratum, saxifragas, and other gems were quite at home, and at the back of the rockery was a fine clump of Polygonum spectabile variegatum, a handsome variety, that deserves widespread popularity.

Under glass zonal and fancy pelargoniums are largely grown, the silver-leaved bedding variety Mrs. Nesbitt being exceptionally attractive. The variegation in foliage is good, and there is an added charm in the trusses of double pink flowers which are freely produced. Other houses contained Calla Elliottiana, roses, dracænas, crotons, Begonia Rex, and caladiums, while a good deal of space is given to such things as East Lothian stocks for seed, primulas, begonias, etc. There are some fine old camellias in the big conservatory, which faces the roadway leading to the main entrance.

Over the entrance gates the Royal coat of arms denotes that Messrs. Forbes are florists by Royal Warrant to his Majesty the King, and a glance through their catalogue—a copy of which, by the way, is a publication that every reader of the Gardeners' Magazine ought to possess, and keep for reference—reveals the fact that well over five hundred members of the Peerage are included among the customers of the firm.

Necessarily, much that is of interest in these important nurseries has been left unnoticed, but it is hoped that sufficient has been said to show that the Hawick nurseries fully deserve the high reputation they enjoy, and that they testify to the immense advance that has been made in British floriculture during the past half-century.

Visitor.

WEBB'S STOURBRIDGE MARROW PEA.

Among second early peas Webbs' Stourbridge Marrow deservedly holds a high position, especially throughout the West of England. Not only is it a sturdy growing and vigorous variety, but it crops with remarkable freedom, the fine pods being well filled with from nine to eleven large peas of splendid flavour. The average height is five feet, but under exceptionally good culture it rises much higher, and produces correspondingly larger crops. In the accompanying illustration a magnificent row of this useful culinary pea is depicted. The row was grown by Mr. Ernest Avery, head gardener to J. B. Brooks, Esq., at Finstall Park, Bromsgrove, Worcestershire. Mr. Avery has stated that the peas grew nearly nine feet high, and from top to bottom the haulm carried pods that were in most cases six inches long. This is a fine testimonial to the variety and to Mr. Avery's ability as a cultivator.

A FINE ROW OF WEBB'S STOURBRIDGE MARROW PEA.
Grown by Mr. E. Avery in the gardens of J. B. Brooks, Esq., Finstall Park, Bromsgrove.

The Almond Tree.—In many Bournemouth gardens the almond tree grows very freely indeed. Towards the end of February, and onwards through March, it is possible to see scores of trees full of blossom. In some roads three gardens out of five contain almond trees, and readers can quite realise how very beautiful they look when literally covered, as many of them are, with their delicate pink blossoms.—G. B.

WORK FOR THE WEEK.

◆

WARM ORCHIDS.

EVERGREEN DENDROBIUMS. — The note from a correspondent in a recent issue of the GARDENERS' MAGAZINE (p. 96), has induced me to refer to this section of dendrobiums some weeks earlier than is the usual custom. The species in general cultivation consist of D. thyrsiflorum, D. densiflorum, D. chrysotoxum, D. Farmeri, D. suavissimum, and the more recently introduced D. Bronkharti, are all classed as evergreen kinds, and all require similar conditions of culture. Some of the earlier flowering kinds, such as D. thyrsiflorum and D. densiflorum, are now producing their flower scapes, and may be removed from their resting quarters and gradually brought into the stove or warm house. I do not consider it advisable to subject them to very liberal treatment until the flower spikes can be distinctly seen. Too much heat and moisture early in the season is liable to cause the plants to commence growing, and where this happens it will usually be found to be at the expense of the flowers. The plants may also drop their leaves at this season, and especially is this noticeable where they have been resting in a cool, dry house and suddenly transferred to a hot house, where the outside conditions have necessitated extra fire heat. But as it is the natural season for leaf fall, the loss of foliage does not always infer that a too sudden change in temperature has taken place. When the flower spikes develop it will be some time before the new growths make their appearance, so that the plants should not be afforded too much water at the roots. The extra moisture in the atmosphere will give a good deal of encouragement, and in bright weather the plants may be syringed overhead, which will considerably assist in keeping the foliage and pseudo-bulbs plump, so that very little root moisture will be necessary.

REPOTTING OR TOP-DRESSING.—It is a good plan to attend to these matters as soon as the plants pass out of flower. Annual repotting is unnecessary, and unless a plant has outgrown its receptacle, or the potting compost is in an advanced stage of decomposition, the removal of dead surface moss and the use of good living material in its place is all that will be required. Some of the species resent being disturbed, and when repotted they should not be pulled about much. Where there are many back pseudo-bulbs, the rhizome should be severed between some of the bulbs, as there are generally dormant eyes capable of producing young growths, though these rarely start unless something happens to the leading growth, so, by making these divisions some time before top-dressing or repotting, the size of a specimen may be increased, or new stock formed as may be desired. The potting compost should be of a good lasting quality. Equal portions of tough fibrous peat, osmunda fibre, and chopped sphagnum moss will suffice. This must be made firm about the roots. I should mention that broken crocks and charcoal must be freely intermixed with the potting material. The receptacles should also have free drainage, and this is essential, because these dendrobiums require abundance of root moisture during their growing season. — H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

FITTONIA ARGYRONEURA is an ideal edging plant for the stages of stoves, its compact habit of growth being combined with ornamental variegated foliage. It is of easy propagation, and roots very readily in a close, shaded pit with a temperature of 70 degrees. From four to six cuttings may be placed near the edge of small 60-sized pots.

PANICUM VARIEGATUM is also a most desirable subject for this class of decorative work, and is indispensable for edging the plant stages, and for house decoration generally. It is also an ideal companion to the fittonias on account of its trailing habit. Place from six to eight cuttings in shallow pans or small pots previously filled with a sandy compost, and put them on a moist base in a propagating case; if kept close for a few weeks they will become thoroughly well established.

ALLAMANDAS.—Although the season is not yet sufficiently advanced for the general routine of repotting of stove specimens, allamandas may be safely dealt with at this stage. Having previously been pruned well back, and all the weak or undesirable wood removed, the specimens should be totally immersed, roots and stems, in a tub or tank filled with tepid water, until the soil has become thoroughly moistened. Allow the soil to drain for a few hours, and then remove the greater part of it from among the roots with a pointed stick, carefully retaining without injury all the fibrous roots. Have in readiness the requisite pots, which must be provided with ample drainage, and use a potting compost of two parts good fibrous loam, one of peat, and the remainder made up of dried sheep manure, with sufficient coarse Bedfordshire sand, mortar rubble, and half-inch charcoal to render the whole sufficiently porous. Potting must be carried out with extreme care, making sure that the rooting medium is moderately firm, as this will produce short-jointed growth which is most desirable for providing a profusion of beautiful yellow trumpet-shaped flowers for as long a season as possible. Allamanda flowers are always welcome, and much appreciated for decorations. After potting, the specimens may be placed in their permanent positions where they will be trained as roof climbers, or should it be desired to treat them as specimen plants for exhibition purposes, they may be trained over the roof on strands of twine until a few weeks before they develop their blooms, when they may be easily removed from the roof and carefully trained around the balloon trellis, or whatever shape is used. During active growth syringe freely, and fumigate immediately any trace of aphis is observed. Avoid overcrowding the shoots, and give ventilation judiciously on all favourable occasions. When placed in rather small pots with a view to repotting later in the season, this latter operation must not be delayed beyond the time when the roots have reached the sides of the pots.—JOHN DONOGHUE, Bardon Hill Gardens.

THE FLOWER GARDEN.

ROSES.—Where possible, it is advisable to complete the planting operations by the end of the month, if the weather is suitable and the soil workable. When filling up gaps in the old beds, it is necessary to use some fresh soil to fill in amongst the roots, but on no account should strong farmyard manure be used, only as a top-dressing when planting is finished.

DECIDUOUS TREES AND SHRUBS should be put out without delay, and securely staked and tied. The supports of autumn-planted trees will require an occasional examination, to make sure that they are in good order. Dwarf shrubs are liable to become loose at their stems, and where this occurs the soil should be made firm again round them. Protection must be afforded tender shrubs aginst the cutting east winds.

PENTSTEMONS. — Rooted cuttings in frames should be potted and kept growing in cold frames. Seeds may also be sown at the present time, and plants be obtained which will flower this season. There are some excellent strains of seeds on the market, and a batch of seedlings is very interesting.

BEDDING CALCEOLARIAS.—The cuttings should have the tops pinched out to induce bushy growth. Abundance of air is necessary on every available occasion during mild weather. When the plants have made fresh growth after stopping, they should be transplanted into other frames, where they will make good examples for bedding out. C. Burbidgei and C. amplexicaulis require potting. The latter makes pretty little standards, if allowed to grow with a single shoot until about two or three feet high, when it should be stopped. It is necessary to "stop" the growths frequently after the desired height is reached to obtain bushy heads. These small standards, used as dot plants in a bed carpeted with the ivy-leaved pelargonium Souv. de Charles Turner, are very effective.

WALKS that have become mossy and dirty will need re-gravelling; others which are not quite so bad will only require turning and rolling down again. The first operation is to trim the edges of the turf with the edging knife, then the surface of the walks which are to have fresh gravel put on should be broken with a fork. These must be raked level, and the gravel spread over, rolling it in as the work proceeds, and using plenty of water to assist in the binding.

GENERAL REMARKS.—During rough weather stakes may be prepared and pegs cut in readiness for layering carnations. Sticks may be trimmed for supporting the sweet peas, as though various plans are adopted for these flowers, yet good hazel sticks are not surpassed for supports. After a heavy fall of snow conifers and shrubs must be relieved of some of the weight by tapping the branches with a pole.—E. C. POOLEY, Gnaton Gardens.

FRUITS UNDER GLASS.

BORDERS FOR YOUNG VINES.—The preparation of the border should be accomplished some few weeks before planting, in order that the soil may have had time to settle and become warm. Those who intend to plant, and have not yet prepared the border, should clear all the old soil and drainage out, and then commence by putting in new drainage, and making sure that all the outlets are in good condition. Place rough stones or brickbats all over the bottom to the depth of six to nine inches—I do not think any benefit is derived from concreting the bottom, as the roots do not get through the layer of drainage materials. On the top of the large stones place about three inches of broken material, and on this place some good loam squares or turves to prevent the soil from finding its way downward and clogging the drainage in years to come. Prepare the material for the first section, and the best is good rich loam from an old pasture or park that has been grazed; it should, however, have been stacked some few months. The soil from a district where lime is present is to be preferred for vines, but lime may be supplied in the artificial form of bones and bone-meal at the rate of 1cwt. to every ton of soil, and a few lbs. of gypsum might also be added. If the loam is of really good quality little manure or other material need be used for the first season.

PLANTING.—The beginning of March is a good time to plant, as the growth should be slow, advancing steadily with increasing sunlight and warmth. Planting canes of one or two years' growth may be used. I always think that nearly a season is gained by using two-year-old plants. Turn the vines out carefully, and then disentangle the roots. I ought to have said that, in case the ball of earth is dry, thoroughly soak it in tepid water so that the greater portion of the soil can be shaken away. Plant as shallow as possible, spreading out the roots evenly, and covering them with soil at once. Make the soil very firm, and when planting is finished give a very light watering.

EARLY VINERY.—Continue to draw down the shoots carefully from the glass, taking care not to pull them down far at a time or they will suddenly snap. Do not allow more than one shoot from a spur, as it is a great mistake to overload or crowd the vines. Damp down the floor several times daily, and syringe the vines twice daily.

PEACHES.—The second house may now be closed in order to form a succession to that started January 1. These will soon be in bloom after closing, and there should be no difficulty in setting, though it will be well to brush over the blooms with a rabbit's tail as soon as the stigma is in condition to receive the pollen.—W. A. COOK, Leonardslee Gardens.

ROYAL SHOW

NORWICH,
June 26th to 30th, 1911.

President - HIS MAJESTY THE KING.

The Regulations and Forms of Entry for IMPLEMENTS are now ready.

Applications for space must be made by MONDAY, MARCH 20th, 1911.

Entries for Trials of Potato Diggers and Potato Sorters close on April 1st.

Live Stock entries close on MAY 20th; Poultry, Produce and Horticulture on May 31st: Cider and Perry entries close on MAY 8th.

THOMAS McROW, Secretary

ROYAL AGRICULTURAL SOCIETY OF ENGLAND,
16, Bedford Square, W.C.
February, 1911.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Gardeners' Orphan Fund.

The annual meeting of this charity was held at Simpson's, Strand, on Friday, February 10. There were about two dozen subscribers present, when Mr. H. B. May opened the proceedings. The usual initial formalities were observed, and then the report and balance-sheet were taken as read.

REPORT OF THE COMMITTEE.

In presenting their twenty-second annual report, covering a period of public unrest and excitement which involved the managements of all charitable institutions in great anxiety and concern, the committee are much gratified in being able to congratulate the supporters of the Fund on the continued steadiness of its progress and increasing usefulness. With great regret, however, they have to acknowledge that the receipts from annual subscriptions do not show the same amount of expansion as other sources of revenue. The total receipts for the year are satisfactory on the whole, but the committee would be glad indeed to welcome more support in the form of annual contributions, however small, and once more appeal for greater consideration on the part of those for whose children the Fund is designed to benefit in their hour of need.

At the commencement of the year there were one hundred and seventeen orphan children receiving the full benefits of the Fund, and eighteen candidates waiting for election were in receipt of compassionate allowances. Fifteen of them were elected to receive full benefits at the annual meeting, bringing the roll of duly elected beneficiaries up to one hundred and thirty-two. During the year twenty-eight nominations of candidates were carefully examined and accepted, and from this list twenty have been selected to appeal for election. It is with extreme regret that the committee can only recommend the election of fifteen children at the annual meeting, and therefore it has not been considered desirable that the name of more than one child from a family should be placed on the voting list. The total amount disbursed in allowances again exceeded any previous total by some twenty pounds, the increase being largely due to the increasing number of candidates appealing for assistance while waiting for election. Since the Fund was established the total amount disbursed in allowances made to orphans amounts to no less a sum than over £22,958.

The number of children who have received the benefits conferred by the Fund is two hundred and ninety-three, and it has been a deep source of gratification to the committee to know that one of the earliest girls to be elected on the Fund has shown her gratitude for the benefits she received in the past by becoming an annual subscriber, an example which in due time it is sincerely to be hoped others will follow.

Through the deeply lamented death of his most gracious Majesty, King Edward VII., the annual festival was held at the Hotel Cecil in May, under the shadow of a great national calamity, but the committee rejoice in being able to record the fact that under the able presidency of Sir Jeremiah Colman, Bart., the festival was well attended, and the length of the chairman's list of contributions greatly exceeded their expectations, the total, indeed, exceeding all previous collections. Sir Jeremiah Colman's great love for horticulture and the sincerity of his kindly regard for the workers in gardens, was admirably shown on that occasion by his deeply sympathetic appeal for support from those who derive pleasure from their gardens, and by his own munificent donation. The committee are deeply grateful to Sir Jeremiah Colman for all his kindness and encouragement, and they invite the subscribers to share in their gratitude by to-day electing him a vice-president of the Fund.

To the stewards on that occasion, through whose kindly efforts the length of the chairman's list was so greatly extended, and to all who so generously assisted in the floral decoration of the Victoria Hall and the adornment of the dinner tables, the committee tender their grateful acknowledgment with the assurance that the results of their labours greatly contributed to the enjoyment of all present.

Arrangements have been made for the next festival to take place at the Hotel Cecil, on Thursday, May 4, under the presidency of one of the earliest supporters of the Fund—Nathaniel N. Sherwood, Esq. It will be within the recollection of the earlier supporters of the Fund that Mr. Sherwood was one of the first to give the movement for the establishment of the charity a helping hand, and gave proof of the sincerity of his desire to set the new institution on a solid foundation by presiding at the second annual dinner in 1889, and by later undertaking the duties of the responsible office of treasurer. From the first the Fund has had no more generous supporter or more ardent friend than Mr. Sherwood, and the committee feel assured that his occupancy of the chair at the Coronation Festival will give pleasure to every well-wisher of the Fund, and ensure for him their presence and support on that occasion.

The members of the Chislehurst Gardeners' Society, the Scottish Horticultural Association, the Bradford Chrysanthemum Society, the Leeds Gardeners' Lodge and Paxton Societies, the Reading Gardeners' Association, and other gardening bodies are all most cordially thanked for their continued exertions on behalf of the Fund, and the committee would most gladly welcome the support of other combinations of horticultural workers who could give valuable help in the same way.

The various honorary local secretaries are also heartily thanked for their much valued assistance. To Mr. George Carver and his horticultural colleagues in the Leeds district, special thanks are due for having organised amongst themselves a system of monthly collections of small sums from gardeners and under-gardeners, and with the happiest results, the Fund having benefited considerably by their action.

To Mary, Countess of Ilchester, Sir Frank Crisp, Mr. Sherwood and his sons, Mr. Leonard Sutton, the Messrs. Rothschild, Mr. E. Rochford, Mr. J. C. Eno, Mr. Anthony Waterer, Mr. H. J. Veitch, Mr. Thomas Smith, Messrs. Barr and Sons, the Messrs. Cuthbert, and others, who have given most generous support during the year, the committee acknowldged their indebtedness with hearty thanks.

It is again the committee's regrettable duty to record their sense of the heavy loss which the Fund has sustained by the deaths of old and well-proved supporters whose places it will be most difficult to fill. In Baron Schröder, who bequeathed to the Fund a legacy of five hundred pounds, the horticultural charities in particular, and horticulture in general, have indeed suffered a grievous loss. The name of Mr. William J. Nutting will also be sadly missed by all who knew him, so greatly was he esteemed. In Mr. E. C. Mott and Mr. William Denning, the Fund has also lost friends who always had the welfare of the Fund very near to their hearts.

The members of the committee who retire by rotation are Mr. William R. Alderson, Mr. George H. Barr, Mr. George H. Cuthbert, Mr. William Howe, Mr. John Lyne, Mr. William Poupart, Mr. Thomas A. Sanders, and Mr. William P. Thomson, and being eligible, offer themselves for re-election.

The auditors, Mr. M. Rowan and Mr. P. Rudolph Barr, are again most cordially thanked for the great care which they have taken in the examination of the accounts, a duty which yearly becomes more onerous, but always most cheerfully discharged. Mr. Barr is the retiring auditor, and the committee are glad to have received his consent to be nominated for re-election.

CASH STATEMENT FOR 1910.

Mr. H. B. May, in moving the adoption of the report, congratulated the subscribers on the steady progress of the society, notwithstanding the political unrest during the year. A number of subscriptions had, however, come in at the New Year, which, in the usual course, would have come in in 1910. He regretted the committee could not see its way to elect more than fifteen children to the benefits of the Fund. Had there been more money forthcoming, more could be done; but remembering the orphans on the Fund, and the urgent need in so many cases of assistance in placing the orphans in the way of gaining a satisfactory livelihood, they could not ignore these claims, and they had not, therefore they could not increase their liabilities by adding more than fifteen orphans this year. He stated that the French Horticultural Society of London had redeemed their promise of a year ago, and sent £20 to the funds, an amount only delayed by the claims of the sufferers from the Paris floods. Mr. Alderson seconded the motion, and it was carried unanimously.

A special case was put forward by the Chairman, who explained the circumstances, and then Mr. Alex. Dean moved, and Mr. Pierce seconded, "That the action of the committee in undertaking on behalf of the Fund the maintenance of George Bailey, a fatherless and motherless boy, aged 14 years, at the School of Handicrafts, Chertsey, for two years at a cost of 5s. per week, be and is hereby confirmed." This was carried unanimously.

Sir J. Colman was thanked for filling the chair at the festival, and was elected a vice-president. Mr. Edward Sherwood was thanked for his services as treasurer and re-elected. Mr. P. Rudolf Barr, the retiring auditor, was re-elected, and Messrs. W. R. Alderson, G. H. Barr, G. H. Cuthbert, W. Howe, J. Lyne, W. Poupart, T. A. Sanders, and W. P. Thomson were re-elected as members of committee, and their services were eulogised by the chairman and Mr. Alex. Dean, the latter pointing out that included among the names were market growers, seedsmen, nurserymen, gardeners in private establishments, and members of the Horticultural Press. The Chairman moved, and Mr. Poupart seconded, the re-election of Mr. B. Wynne as secretary at a salary of £200; Mr. T. A. Sanders supported the motion.

Messrs Bates, Ingamells, Lyne, Moorman, Poupart and Wright were elected scrutineers of the ballot, and the meeting then adjourned until the declaration of the poll.

The poll was announced about 4.30, when the following candidates were declared duly elected: John Herbert Jones (363 votes), William Alfred Bailey (353), William George Wright (341), Samuel Rainey (339), Cyril Mark Foster (316), Monica Aileen Hulks (299), Frederick John Moore (289), Leslie Richard King (288), Victor Powesland (287), Maurice Leslie Johnson (269), Ada Winifred Pearson (257), Mabel Holloway (240), Albert William Whitlock (234), Wiliam Norton Glide (233), John Charles Gould (231).

The poll having been declared the scrutineers were accorded a vote of thanks for their services, and with a similar compliment to the chairman the proceedings terminated.

In the evening the committee and friends, to the number of about thirty, dined together at "Simpson's," with Mr. H. B. May, V.M.H., as chairman.

Proposed National Daffodil Society.

Immediately at the close of the annual general meeting of the Royal Horticultural Society, a meeting of daffodil-lovers was held in the No. 3 Committee Room at the R.H.S. Hall, to consider the question of a National Daffodil Society. The Rev. G. H. Engleheart presided, and Mr. Cranfield, who had unfortunately lost his notes, outlined an idea for the formation of a society. He considered there was a need for such a body, a need for a great London Daffodil Show, a need for a Daffodil "Annual," and a need for the encouragement of daffodil culture among amateur daffodil lovers and growers. He thought the proposed society would not clash with the functions of the R.H.S. Daffodil Committee, or the Midland Daffodil Society. Mr. Engleheart, instead of pressing the needs of a new society, pointed out the great difficulties it would have to encounter, such as the present already largely-organised work among daffodils, the financial question, etc. He thought if a good London show could be provided between the two R.H.S. meetings in April, the chief reason for a society would be met, and he suggested the organisation of such a show in conjunction with the R.H.S. to test the feeling of the public, in so far as a new society was concerned.

Mr. R. Sydenham thought there was hardly need for a society, remembering the work of the Daffodil Committee, and the Birmingham and other societies. The Rev. J. Jacob thought if the Daffodil Committee asked the R.H.S. Council for a two-day show in April, for a subsidy to work it, and for the publication of an "Annual" and portraits of new daffodils, that the Council would probably grant the request. Many present considered the Council would do no such thing, and Mr. Wallace said it would be impossible for the Council to subsidise daffodils and not roses and other flowers. Mr. Jacob's proposal was a sort of red herring drawn across the trail of the proposed new society, and most of the desultory discussion that followed bore some reference to what the R.H.S. might or might not do. Mr. Adams, Mr. Watts, Mr. P. R. Barr, Mr. J. H. Dick, Mr. C. H. Curtis, Mr. E. A. Bowles, and Mr. Darlington all spoke, and Mr. Bowles said he did not think the Council would be prepared to grant a large subsidy for an exhibition, etc., as suggested; but probably, if so desired, the functions of the R.H.S. Daffodil Committee might be broadened. Two motions were before the meeting, but neither of them was put. Mr. Cranfield was evidently disappointed at the result of the meeting, and he seems inclined to go ahead with his project in spite of the "faint praise" received. At present the meeting stands adjourned until March 14, when the members of the R.H.S. Daffodil Committee and others will reconsider the subject, and probably approach the R.H.S. as a preliminary step for or against a new society.

Miss Willmott, Mr. and Mrs. J. Douglas, Messrs. C. Dawson, H. Smith, C. E. Shea, — Crosfield, J. D. Pearson, C. Pearson, C. Bourne, and J. Harvey were among those present, in addition to those already mentioned.

Scottish Horticultural Association.

The February monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 7th inst., when Mr. Whytock, the retiring president, who occupied the chair at the outset of the proceedings, presided over an audience of 120. After the preliminary business of the evening was over, Mr. Whytock vacated the chair in favour of his successor, Mr. Massie, whom he introduced to the meeting, and thereafter the new president delivered his inaugural address, taking as his subject, "Looking Forward; or the Future of Our Association." Mr. Massie gave a long and interesting account of the efforts of the association since its commencement to form a horticultural institution in Edinburgh, and of its accomplishments in other directions, and he laid before the members the following proposals which he commended to their attention, and appealed to them to give them their most serious consideration, namely:

(1) To start a fund to provide for a horticultural institution, to contain at least a library and reading room, hall for meetings, and suitable offices, and other accessories.

(2 To readjust the finances of the association, and of the chrysanthemum exhibition.

(3) To adopt means for the encouragement of the younger members to take a larger share in the work of the association by providing more facilities for the reading of papers, and for discussions amongst themselves, and by offering prizes to those who acquit themselves with most merit; and by instituting examinations, and granting to young gardeners certificates of proficiency in theoretical and practical horticulture.

(4) By instituting a Scottish Benevolent Fund for the behoof of gardeners and others and their wives and children.

Mr. Massie's proposals were very favourably received, and a motion by Mr. McHattie, seconded by Mr. Whytock, and supported by Messrs. Cuthbertson and Todd, to remit them to the council for consideration, was carried unanimously. On the motion of Mr. D. W. Thomson, Mr. Massie received a very cordial vote of thanks.

Two exhibits only were put forward. One was samples of "The Sutton" and "Victoria" rhubarb, to show their relative merits as forcing subjects, "The Sutton" variety being longer and of better quality than the "Victoria" variety. The other was rhubarb from the open ground, from the Edinburgh Distress Committee's farm at Murieston, per Mr. Cairns. The stalks of this were over six inches long.

An interesting item of news conveyed to the meeting by the Chairman was that Mr. Alex. Mackenzie, of Warriston Nurseries, Edinburgh, who is still active and on duty every day, had just completed his eightieth year, and the secretary was instructed to convey to him the hearty congratulations of the members on his becoming an octogenarian.

At the next monthly meeting, on March 7, Mr. Wm. Cuthbertson, J.P., will give a paper, entitled "A Talk About New Sweet Peas."

Thirty-four new members were elected.

East Anglian Horticultural Club.

At the February meeting of this club, before a large gathering of members, Mr. W. Bradbury, Ipswich, gave a most interesting paper upon the subject of "The Non-Setting of Fruit Blossoms." Having first by means of well-prepared drawings, described the physiological characteristics of the flowers, and made the audience conversant with their structure, he went on to attribute the several causes which were responsible for the non-fertilisation of the flowers. Frost damaging the stigma was the greatest cause, for if the stigma was in any way injured, the pollen was unable to perform its function. Then he also said it had been noticed that many of our fruit trees, apples and pears in particular, were self-sterile, and to obviate this trouble care should be taken at planting time to associate trees of different varieties that flowered at the same time, so by the many agencies pollen could be carried from tree to tree, and a "set" of fruit ensured. Excessive wet spoilt the chances of the dry pollen being carried about, as required, and heavy winds smashed the delicate organs of the flowers, and rendered them useless. A keen discussion followed the paper, in which Mr. Lewis Smith (president), and Messrs. J. Powley, H. Perry, Frank Neave, C. H. Fox, J. C. Abel, W. Watson, G. Moore, and F. J. Endersby took part.

Mr. John H. Willis, Norwich, has kindly undertaken to supply each month a report of the weather, temperature, sunshine, and rainfall. This report was read for the first time at this meeting, and proved most useful. The exhibits made a very pretty display. Apples and pears still came in good numbers and quality. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, staged a beautiful bunch of calanthes. Mr. W. Laws, gardener to G. E. White, Esq., Eaton, had a fine batch of carnations of the leading varieties, and a good cypripedium. Bulbous flowers were very creditably exhibited by Mr. F. Williams, gardener to Louis Tillett, Esq., Catton. Messrs. Daniels Bros., Lim., Norwich, staged a varied assortment of winter-flowering shrubs in pots.

Birmingham Gardeners' Association.

The second fortnightly meeting was held on Monday, February 6, Mr. C. H. Herbert in the chair. There was a large attendance of the members to meet Mr. J. Udale, Droitwich (Instructor of Horticulture to the Worcestershire Education Committee), who gave a demonstration upon "Pruning Fruit Trees" accompanied with lantern slides. This is a branch of fruit tree culture Mr. Udale is eminently qualified to teach, from his long experience as a cultivator and experimentalist in hardy fruit culture. After extemporising upon the needs and objects of fruit production, the theme of the essay was the comparative merits of the seasons for pruning after planting, and which, to some extent is still a vexed question among cultivators, the predominant opinion, however, being in favour of pruning during the springtide when the wood buds are vegetating, or even a little later on, when the foliage is expanding. In regard to the pruning of plums and other "stone" fruits, a sparing use of the knife or sécateurs was urgently recommended, chiefly to avoid as much as possible the inevitable gumming.

Statistics were given of the produce of fruit realised under various experimental prunings, both of which were excellently illustrated by a multiplicity of lantern slides. Mr. Udale's lengthened address left but little time for discussion, and a hearty vote of thanks was accorded him for his instructive and interesting demonstration.

Reading Gardeners' Association.

The usual fortnightly meeting took place in the Abbey Hall on Monday, February 6, when there was again a large attendance, the president, Mr. Alderman Parfitt, occupying the chair. The minutes of the last meeting having been read and confirmed, the President, in a feeling manner referred to the recent death of Mrs. Martin Sutton, and proposed the following resolution: "That this meeting of the Reading and District Gardeners' Mutual Improvement Association tenders to Mr. Martin J. Sutton and family their deep sympathy in the very great bereavement they have sustained, and that the hon. secretary be requested to convey this resolution to Mr. Martin J. Sutton by letter." This was seconded by the vice-chairman, Mr. H. Goodger, and carried sub-silentio, all those present standing.

New members having been elected, the President explained that owing to the illness of Mr. E. J. Dore, who was to have spoken on this occasion on "Begonias," Mr. J. W. Tayleur, B.Sc., of the Reading University College had most kindly brought his lecture on "Soils," which was to have been given on February 20, forward to this evening, and so filled the gap created by the absence of Mr. Dore.

Mr. Tayleur was no stranger to his audience, having lectured to them on "Manures" just about twelve months ago, and then as on the present occasion, he was followed with deep attention and interest.

The lecturer explained that he did not intend to deal with his subject from the practical point of view, his audience being probably better versed on that side of the question than he was. His remarks would deal with soils from their scientific aspect alone. Mr. Tayleur is to be congratulated on handling such a complex subject in a fashion easily intelligible to all present, and his lucid manner in making perfectly plain any little intricacies was much appreciated. The different factors of soil fertility, mechanical analysis of soils, chemical analysis, availability of the plant food, organic matter and lime in soils, effects of manure (nitrogenous, phosphatic and potash) and the essential elements of plant food were in turn dealt with. Mr. Tayleur ably answered the many questions put to him by the inquiring minds. He was warmly applauded, and received a hearty vote of thanks on the proposition of the President, seconded by the Hon. Secretary.

Bournemouth Gardeners' Association.

The annual general meeting of the members of this association was held on Tuesday, February 7, at the Avenue Assembly Room, Town Hall Avenue.

J. H. Ralph Smythe, Esq., J.P., the president, occupied the chair. The annual report and statement of accounts were discussed and adopted. A number of ordinary and honorary members were proposed and elected. The lectures given during the past year were much appreciated; they were of a high order of merit, being very interesting and instructive.

The lectures and papers arranged to be delivered during the first session of the year 1911 are also of a very high order, and embrace a wide range of subjects, including science and plain cultural matters that will be all very instructive to horticulturists.

In connection with a number of the ordinary meetings of the members, exhibitions of cut flowers and plants have been arranged. This is in addition to the usual practice of staging produce for the society's certificates.

Very hearty votes of thanks were passed to the retiring officers and committee. The worthy president was re-elected, also the vice-presidents, several other gentlemen being added to this body. Nearly all the old members of the committee were reappointed, and several new members were elected to fill vacancies, including one made through the death of the late Mr. T. Sprackling. Mr. G. Barge was re-elected librarian. He has filled the post with great satisfaction to the members for some time past. The hon. secretary, Mr. J. B. Stevenson, who has taken a leading part in connection with the society from its birth, was re-elected, and he now commences his twenty-third year of service.

The committee received the resignation of the assistant secretary, Mr. W. Shave, with much regret, as he has filled the post with distinction for a number of years. Mr. C. Nippard was elected as assistant secretary with the good wishes of the members. Prominent residents are now taking a keener interest in the welfare of this association.

The Southampton and District Gardeners' Mutual Improvement Society.

In order to promote the educative side of horticulture and further it's interests the Southampton and District Gardeners' Mutual Improvement Society has been formed, and it is intended to hold periodical lectures and discussions on various matters of interest.

The first lecture will be held in the Highfield Church Institute, Southampton, on Wednesday, 22nd inst., at 8 p.m., when Mr. G. C. Gough, B.Sc., of the Board of Agriculture will give a lecture on "American Gooseberry Mildew and Wart Disease of Potatoes," illustrated by lantern slides. This will be an "open" lecture, and all interested are invited to attend.

Further particulars of the society may be obtained from the hon. secretary, Mr. Charles Reed, Twitton, Highfield, Southampton.

HOW TO GROW SWEET PEAS.—"SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis (Secretary of the National Sweet Pea Society), is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 2d., or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

Eckford's
Giant SWEET PEAS

The Flower for the Coronation.

The Coronation Flower, par excellence, is going to be the Sweet Pea. When "Flaming June" comes everybody will be wearing it and everybody will be talking about it. Its popularity will excel that of any flower of any time—and deservedly so, for what other flower can show such a variety of colour, bear such an abundance of bloom, and continue in flower for such a long period.

Now is the time to begin sowing, and a long succession of bloom can be arranged for by making fresh sowings right through the months of February and March. Seed, however, should be ordered immediately.

Buy your seed NOW, and buy from Eckfords. No other Seed Specialist in the world can rival Eckford for Sweet Peas. Larger flowers, longer stems, brighter colours, and a profusion of bloom are certain if you grow Eckford's Sweet Peas. Every packet of seed which Eckford's sell is put up in a sealed packet bearing their name—a guarantee of excellence—and can only be obtained direct from Wem. No agents are employed.

A specially written booklet on Sweet Pea Growing given with every order. Send to WEM for satisfaction.

SPECIAL NOVELTY OFFER FOR 1911.

LUMINOSA.—This variety will be appreciated for its deep coral colour, which for decoration is unexcelled, having the quality of giving off greater brilliance in artificial light than any other variety. Very scarce. In sealed packets, 7 seeds, **6d.**; 15, **1s.**

VICOMTE DE JANZE.—A fine bold flower of exquisite shape, the standard being splendidly erect; in colour it is deep bright rose, perfectly distinct; a charming flower. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

DODWELL F. BROWNE (WAVED).—This is a very beautiful intense bright crimson, three and four flowered, almost a self; a true Giant Waved variety of intense King Edward VII. colour. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SAINT GEORGE.—Light orange pink standard with slightly lighter wings; almost a self; good size, slightly waved. In sealed packets, 20 seeds, **3d.**; 40, **6d.**; 80, **1s.**

ASTA OHN (WAVED).—A pretty waved lavender overlaid with rose; a very charming flower of good size and substance. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

APPLE BLOSSOM (WAVED).—This, as its name implies, is a beautiful flower of apple blossom colour, of giant size, and, like most of the waved varieties, is a very strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

PICOTEE (WAVED).—This is one of the very finest introductions, being a giant waved flower, pure white, with a beautiful picotee edge of carmine; in most cases the flowers are borne in fours on a long, strong stem. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

MAGGIE GERRING.—This is a decided acquisition with a bold standard of perfect shape, and beautifully balanced wings. In colour it is a soft cream overlaid with a delightful shade of pink which rather deepens towards the edges. It is exquisitely rich in tone when bunched. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

MRS. E. GILMAN.—A fine bold flower, with expanded standard. It has a creamy ground suffused with bright rose, and almost pure cream wings. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1s.**

EVELYN HEMUS (WAVED).—A warm cream, shading to yellow, with a picotee edge of terra cotta pink; of great size and refinement; standard and wings beautifully waved, and nearly always four-flowered. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MRS. HENRY BELL (WAVED).—A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

MID BLUE.—A medium-sized erect flower of deep sky blue. It is a strong grower, very free, and frequently four flowered; quite distinct. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

OTHELLO (WAVED).—A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s**

CERISE (WAVED).—A fine, bold, beautifully waved, true cerise; a very strong grower, giving generally four flowers on long, strong stems. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1s.**

SPECIAL OFFER. One full-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **12/6** post free for cash with order
One half-sized packet of each of the foregoing 14 charming and Novel Sweet Peas, **6/6** post free for cash with order

SPECIAL COLLECTIONS FOR 1911.

Villa (A) Collection. [illegible] very choice varieties, suitable for villa garden, excellent giant flowered sorts, most suitable for cutting and exhibition, 25 seeds of each, **10s.**, post free, cash with order.

Villa (B) Collection. 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s. 6d.**, post free, cash with order.

Villa (C) Collection. 12 splendid varieties, suitable for exhibition, 50 seeds of each, **2s. 9d.**, post free, cash with order.

Exhibitor's (D) Collection. 12 Giant Waved varieties, new and up to date; fine for exhibition, [illegible] seeds of each for **2s. 9d.**, post free, cash with order.

FREE. Send a postcard to-day for large illustrated and coloured catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

HENRY ECKFORD, F.R.H.S (Dept. 221), Sweet Pea Specialist, WEM, SHROPSHIRE.

OBITUARY.

MR. JAMES WALKER, F.R.H.S.

We greatly regret to record the death of Mr. James Walker, which occurred at his residence, Ham, Surrey, on the 12th inst., in his seventy-fourth year. Mr. Walker was a native of Rutherglen, Lanarkshire, and came to England in 1875, and throughout the thirty-five years that have elapsed since he came south he has been one of the leading growers of fruits and flowers for the supply of the London markets. He was not only a leading grower; he was one of the most successful, which is all the more remarkable from the fact that until leaving Scotland he was engaged in a business of a quite different character, and had no experience of gardening, excepting that which he had obtained in a small city garden, in which he evinced much interest. Taking up his abode at Whitton, then one of the most important market garden districts in the Thames Valley, he engaged in the cultivation of flowers, and achieved much success as a cultivator of cyclamen. He also gave attention to daffodils, and by 1884, when the first Daffodil Conference was held under the auspices of the Royal Horticultural Society at South Kensington, he had formed so comprehensive a collection that he was able to stage, in splendid condition, about one hundred varieties. Mr. Walker had travelled much, both at home and abroad, in search of daffodils of merit, and at the conference he was acknowledged to be one of the foremost authorities on these flowers, and this position he maintained until his death. Soon after the year last-named, Mr. Walker purchased a tract of land at Ham, where he built himself a residence, and formed a fruit farm on the most approved method. An important feature of the farm was formed by the fifteen span-roof peach houses, which occupied an acre of ground, and furnished immense supplies of fruit of the finest quality. It is probable that there has been no more successful example of peach culture under glass than was afforded at Ham. The fruit plantations outside consisted chiefly of bush trees, and exclusively of the best varieties of the respective kinds, and the results were such as to show that Mr. Walker was fully conversant with all that is conducive to success in hardy fruit culture. Mr. Walker continued the cultivation of daffodils on a large scale, and it is said that last year he supplied a Dutch firm with nine tons of bulbs of one variety. For thirty years he has been a Fellow of the Royal Horticultural Society, and since 1885 a member of the society's Floral Committee. At the meeting of this body on Tuesday Mr. H. B. May, the chairman, referred in sympathetic terms to the loss sustained by the death of Mr. Walker, and it was unanimously resolved that a vote of condolence should be sent to his family. Mr. Walker was for many years a member of the Committee of the Royal Gardeners' Fund.

Mr. GEORGE DANIELS.

There passed away quietly at his residence at Norwich on Friday, the 10th inst., Mr. George Daniels, a horticulturist, who, through advancing years, has not of late been prominent in horticultural circles, but who in his younger days did much to promote the advance of gardening in East Anglia. Mr. George Daniels was one of the founders of the firm of Messrs. Daniels Brothers, but retired when the business was converted into a limited liability company. He was a supporter of the Norfolk and Norwich Horticultural Society, and one of the founders of the East Anglian Horticultural Club.

MR. SAMUEL GIBBINS.

We regret to learn of the death, on February 1, of Mr. Samuel Gibbins, secretary to Messrs. J. C. Wheeler and Sons, Ltd., of Gloucester. Mr. Gibbins was also secretary to the Gloucester Chamber of Agriculture and the Gloucestershire Rose and Sweet Pea Society. Mr. Conway Jones represented the latter body at the funeral, which was attended by members of the Corporation, Chamber of Agriculture, the office and nursery staffs of Messrs. J. C. Wheeler and Sons, and the church, Sunday school, and Mission, in all of which Mr. Gibbins took a personal interest. Large numbers of floral tributes were sent, including a large cross of white tulips, hyacinths, and lilies, from the employees of the Messrs. Wheeler. Mr. Gibbins was laid to rest amid abundant tokens of the love and respect in which he was held in the city of Gloucester.

MR. ALFRED W. WEEKS.

With much regret we learn that Mr. A. W. Weeks, who has long occupied a prominent position in horticultural circles, died on the 10th inst. As head of the well-known firm of Messrs. J. Weeks and Co., Mr. W. A. Weeks was one of the leading authorities on the erection and heating of horticultural buildings, and was highly esteemed by his many friends. Mr. Weeks was for several years a member of the committee of the Royal Gardeners' Orphan Fund, of which he was a generous supporter. He retired from business some years since.

TRADE NOTES.

Messrs. Hugh Dickson, Royal Nurseries, Belfast, have received an intimation that his Majesty King George V. has been graciously pleased to confer on them the Royal Warrant of Appointment as nurserymen, seedsmen, and florists to his Majesty in Ireland.

Messrs. Joseph Bentley, Lim., of Barrow-on-Humber, have been granted the Royal Warrant of Appointment as horticultural chemical manufacturers to his Majesty King George V.

Messrs. Dickson and Robinson, Cathedral Street, Manchester, have been appointed by Royal Warrant as seedsmen to his Majesty King George V. For many years they held the warrant of appointment to her Majesty the late Queen Victoria, and to his late Majesty King Edward VII. from the time of his accession.

Messrs. Little and Ballantyne, nurserymen and seedsmen, Carlisle, have been granted a Royal Warrant of Appointment as seedsmen and nurserymen to his Majesty King George V.

GARDENING ENGAGEMENTS.

Mr. Frederick Akers, jun., for the last four years in the gardens at Albury Hall, Ware, has been appointed head gardener to E. Martin Smith, Esq., Codicote Lodge, Welwyn, Herts.

Mr. W. Felstead, for seven years assistant superintendent of the Leicester Parks, has been appointed superintendent of the Parks and Open Spaces at Wolverhampton.

FORTHCOMING ENGAGEMENTS.

[The Editor will be greatly obliged if Secretaries of Societies will send schedules and dates of exhibitions to him, at Endsleigh, Priory Park, Kew, Surrey.]

MONDAY, February 20.—National Chrysanthemum Society; Executive Committee.

WEDNESDAY, February 21.—Irish Gardeners' Association Meeting.

TUESDAY, February 28.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Recent Works in Seed Selection," by Mr. G. F. Scott-Elliott, M.A. (Masters' Lecturer for 1911); Scientific Committee at 4 o'clock.

SCHEDULES RECEIVED.

SOUTHAMPTON HORTICULTURAL SOCIETY.—Rose Show at the County Ground, June 27 and 28; Garden Fête at South Stoneham House on July 12; Carnation and Sweet Pea Show, on the Pier, July 28; Chrysanthemum and Fruit Show, on November 7 and 8.

CARDIFF HORTICULTURAL SOCIETY.—Twenty-third annual show in the Sophia Gardens, July 26 and 27.

GRAND YORKSHIRE GALA.—Fifty-fifth annual show in Bootham Park, York, on June 14, 15, and 16.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

LONDON BRANCH OF THE B.G.A.—F. E., Finchley: The London branch of the British Gardeners' Association holds its meetings at Carr's Restaurant, Strand, W.C. The branch secretary is Mr. V. Cockram, 37, Bolan Street, Battersea Park, S.W.

THE FOOD OF PLANTS.—S., Keighley: Useful books other than you have include Sorauer's "Physiology of Plants" (Longman, Green, and Co.); "The Soil," by A. D. Hall (John Murray); and "Fertilisers and Manures" by A. D. Hall (John Murray). Before obtaining these, however, you should have studied the elementary works carefully.

BLACK CURRANTS.—J. W., Exeter: The black currants so familiar to us in puddings, cakes, etc., have nothing whatever in common with the black currants of our gardens. The latter are a species of ribes, while the former are small grapes. "Currant," when used by the grocers, is a corruption of the word Corinth, the corruption being probably due to the resemblance between the dried "currants" of commerce and the black currants of our gardens. The Black Corinth grape is the source of imported currants, and the vines are grown in Greece and the Ionian Islands as low bushes; the fruits are dried in the sun as they ripen, being placed on nets on the ground or in trays.

SOWING SWEET PEAS.—W. J., Feltham: Sow five seeds in a 48-sized pot, placing them half an inch deep in sandy soil. Put the batch in a greenhouse, water them, and let them remain here until the seedlings push through the soil; then shift them into a cold frame, in a sunny position. Keep them close for a few days, and then gradually increase the ventilation until by the time the plants are three or four inches high, air is admitted at all times except in severe frost, while on favourable days the lights may be removed altogether. You will find "Sweet Peas and their Cultivation," post free, 1s. 2d., or in cloth, post free, 1s. 8d., very useful; it can be obtained from the Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.

STARTING BLACK HAMBURG VINES.—W. F., Chippenham: You might very [illegible] start the vines before the first week in Ma[illegible] if there is any need for so doing. The [illegible] difficulty in connection with outside borders is that of keeping them from becoming [illegible] and cold during the winter, but if you [illegible] covered the soil with last year's leaves [illegible] foot thick, you have little to fear. Some [illegible] frame lights or sheets of galvanised [illegible] put over the borders would help in keeping them warm, but under such shelter [illegible] become dry rather quickly, hence the need of care in that direction. If a top dressing of good soil is needed this should be [illegible] directly the fruit has been cut and while the leaves are green; remove the inert [illegible] laying the roots bare, and then add a [illegible] of good loam mixed with bone-meal or decayed manure. Give the border a [illegible] mulching of rich manure, several [illegible] thick, as soon as the vines get well [illegible] and, if necessary, add one or more [illegible] dressings as the season advances, and the grapes show colour.

MAGGOTS IN SWEET WILLIAMS.—G. A. W., Chippenham: The trouble is due [illegible] a leaf-mining grub like those which [illegible] celery, marguerites, etc. It is some[illegible] unusual to find a visitation so late [illegible] season, but evidently conditions were fa[illegible] able to the deposition of eggs late in [illegible] autumn. Two or three broods [illegible] hatched in a favourable season. The [illegible] autumn maggots turn to pupæ and remain [illegible] the ground in that state during winter. [illegible] evidently a late brood hatched out during mild weather, and the flies deposited their eggs on the sweet williams. You [illegible]

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For FEBRUARY 25, 1911.

Please Repeat my Advertisement.

Name..

Address..

....

Date..............................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

nothing to save plants so badly affected as those sent, but you can do a good deal to prevent future attacks by burning the infested stock and either burning or very deeply burying the upper three or four inches of soil in which the plants have been growing. Crops likely to be attacked should be frequently sprayed over with a quassia or soot solution, or even a weak nicotine mixture, each having a little soft soap added to make it slightly adhesive. Are the wild parsnip and the several buttercups and crowfoots abundant near your garden? If they are you must be careful with celery, parsnips, ranunculuses, marguerites, and sweet williams, as the maggots frequently flourish among the above-named wild plants.

ECHINOCYSTIS LOBATA.—A. D., Haslemere: This is a rather uncommon but free-growing annual that needs to be treated much in the same way as a gourd or a vegetable marrow, so far as germination and early culture are concerned. But during June the plants should be set out in a sunny and sheltered position in rich soil. This cucurbit is a free-growing climber, and would do very well to run over a garden archway, or up an old tree. The male flowers are freely produced, but the female ones are not so numerous; these latter produce roundish spiny fruits that are very attractive, and which when ripe and dry contain a network of woody tissue, in which are a few blackish seeds that are shaped like vegtable marrow seeds.

FLOWER BEDS.—A. E. S., Broughton: Inasmuch as you do not give the sizes of the beds, their distances from each other, and the general position of the set relative to the house, we are at a disadvantage. Lobelia fulgens would not do in the colour scheme you outline. We suggest that you place a tall palm or bamboo, or other tall graceful foliage plant in the centre of No. 1 bed, and put well-grown castor oil plants and cannas around it, with a few examples of the white Swainsonia galegiflora among them; the edging could be of alyssum or J. B. Riding viola. Beds 2 and 3 should look well filled with rich pink begonias over a ground working of dwarf alyssum. The pink ivy-leaved pelargonium Galilee should suit beds 4 and 5, with an edging of a soft primrose or creamy yellow viola, such as Marchioness or Primrose. Fill beds 10 and 11 with Souv. de Chas. Turner ivy-leaved pelargonium, and Miss Willmott verbena, and swainsonias. Beds 6 and 8 would easily be filled with a groundwork of J. B. Riding viola, under white begonias, while 7 and 9 should by way of contrast be filled with pink begonias over alyssum.

FIRST-CLASS CERTIFICATE FOR VEGETABLES.—M. E. M., Worcester: You are quite right. The regulation is in the "Book of Arrangements for 1911," published by the Royal Horticultural Society; it is as follows: "Such new fruits and vegetables as have received an Award of Merit, and are prima facie considered to be probably worthy of an F.C.C. must be seen growing by a member of the committee and two practical gardeners or amateurs, and their report duly considered by the committee, before an F.C.C. award is recommended to the Council.

NAMES OF PLANTS.

G. H., Downe.—Odontoglossum crispum.

A. D., Haslemere.—A fruit of Echinocystis lobata.

H. I. S., Tarporley. — 1, Primula floribunda; 2, Acacia armata; 3, Dieffenbachia Bausei; 4, Dracæna congesta; 5, D. Goldieana.

S. C. H., Louth.—1, Saxifraga apiculata; 2, Iris reticulata; 3, Chorezema Lowi; 4, Dendrobium aureum; 5, Cupressus lusitanica; 6, C. funebris.

H. T., Swindon.—Dendrobium nobile; there is a good deal of variation in this species, very much more than in the two flowers sent. In some of the hybrids, notably D. Ainsworthi, there is also a good deal of colour variation.

MARKETS.

◆

COVENT GARDEN.

Flowers.

Forced flowers are now fairly plentiful; carnations are excellent, and there is a good demand.

		s. d.		s. d.
Acacia	per pad.	5 0	to	7 0
Azaleas, white	per doz. bun.	3 0		4 0

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

NOW IS THE TIME TO PLANT a permanent border of hardy perennials, which is secured by the use of the KELWAY "ARTISTIC" BORDER, which can be planned to fill any space at a cost of 15s. or 25s. for every 10 square yards. It is carefully planned for succession and for colour harmony, and will flourish under almost all conditions of soil and climate. Send for Kelway's "Gardens of Delight," price 6d. post free.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY DELPHINIUMS which have been improved almost out of recognition in the past twenty years. They produce plants ranging in height from four to eight feet, exceptionally hardy, and with a rich profusion of choice blooms in all the shades of blue.
Choice named varieties: 24s. 34s., and 56s. a dozen.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

EVERY Gardener, amateur or professional, will find a large amount of useful information in the new edition of Kelway's "Manual of Horticulture"—the varieties, prices and culture of all sorts of garden plants, particularly those wonderful improvements raised in the Kelway Nurseries at Langport. A copy will be sent post free for 2s., which will be credited on the first order. Now is the time to plant.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

KELWAY GLADIOLI flower freely in the open air through the autumn. Their fine bold blooms make an admirable addition to borders or beds and are invaluable as cut flowers for church or table decoration. Choice named collections, 3s., 4s. 6d., 6s., 7s. 6d., 9s., 12s., and 18s. a dozen.
Order at once.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

FIDLER'S NEW ILLUSTRATED CATALOGUE OF CHOICE GARDEN SEEDS will be sent, post free, to any address on receipt of postcard. Write at once for a copy. It may help you to save 50% on your seed bill this season. FIDLER and SONS, Royal Berks Seed Stores, Reading.

TRIPLE TESTED SEEDS

Many firms offer seeds: few really test them. It is a long, laborious business and very expensive. But

IT IS ABSOLUTELY ESSENTIAL!

The firm which doesn't test is at the mercy of the grower.

AND THE GROWER KNOWS IT.

WE TEST AND TEST, AND TEST AGAIN.

RESULT—Sales steadily increasing year by year. They are already 20 per cent. ahead of last year! which simple fact speaks volumes about the opinions of our clients. Get our Illustrated Catalogue. IT IS FREE.

BEES L$^{\text{TD}}$. DEPT. 6, MILL ST., LIVERPOOL.

NOVELTY IN THE FLOWER GARDEN.

In these days the keen amateur is always on the look-out for something different from anything possessed by his neighbours. We have no objection to that, on the contrary it is our business to hunt up all the best and newest things in plants and seeds from all parts of the world. A perusal of our New Seed Catalogue, which contains 12 pages of descriptions of novelties, will reveal many choice things not to be found in any other list.

Latest Novelties in Sweet Peas, Hardy Perennials, Annuals, and Miscellaneous Seeds.

These will mostly be found priced lower than by any first-class house, especially the Sweet Peas, of which we are large growers.

THOMPSON & MORGAN,

Seedsmen, IPSWICH.

100,000 WALLFLOWERS, dwarf-grown bushy plants, full of buds. Why plant long, straggly seedlings when you can get plants that will throw from 10 to 20 spikes of flowers so cheaply? BENTLEY'S Concentrated Alkali.

THE IDEAL WINTER SPRAY.

For Fruit Trees and Forest Trees of every kind.

Destroys **INSECTS** (whether in the active or dormant state), **spores of fungi, lichens, mosses.** Cleanses the bark from **vegetable growths.** Detaches loose and decayed bark, thereby exposing the harbouring places of the insects, and having on these a most deadly effect without injuring the trees.

For Apple, Pear, and Plum Trees, Bush Fruits, and Forest Trees. 1 tin dissolved in 11 gallons of water.

For Apricot, Peach, Nectarine, and Cherry Trees. 1 tin dissolved in 16 gallons of water.

PRICES:—

1 to 8 tins, **1/3** each; 8 tins, **1/2** each; 12 tins, **1/1** each; 20 tins, **11d.** each; 40 tins, **10d.** each.

BENTLEY'S INSECTICIDE.

This valuable **NON-POISONOUS Plant Wash** has for the last thirty years held the highest position in the Horticultural World as a most effectual **Destroyer of all Forms of Filth,** including

MEALY BUG, SCALE, AND THRIP,

without risk to the foliage. It also possesses cleansing properties, and leaves the foliage clean and bright.

PRICES:—

6 galls., **7/6** per gall.; 3 gall., **8/-** per gall.; 1 gall., **9/-**; ½ gall., **5/-**; 1 quart, **3/6**; 1 pint, **2/-**. **Carriage paid on 7/6 orders and upwards to any railway station.**

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

GEO. COOLING & SONS,
The Nurseries, Bath,
Offer fine stocks of the undermentioned.
Now in splendid condition for removal.

ROSE-TREES.

List Post Free. The Collection is one of the largest and most complete in cultivation. We offer Bush Roses, strong plants, from **6/-** to **10/6** per dozen; **40/-** to **70/-** per 100. Standard Roses, from **18/-** per dozen.

ROSES IN POTS FOR FORCING.

List Post Free. A large Collection prepared for spring flowering of all the most suitable Tea scented and Hybrid Perpetual kinds. Strong plants, in 5in. pots, **15/-** per dozen; in 6in. and 7in. pots, from **18/-** to **30/-** per dozen.

FRUIT-TREES.

List Post Free. Our Fruit Trees have always had a great reputation for clean, well-ripened growth and correctness of naming. The following Collection of Bush Trees is recommended for a small garden, and will be forwarded, packing free, upon receipt of cheque or P.O.O. for one guinea:—Four Bush Apples, including good specimens of Beauty of Bath, the best early apple, Cox's Orange Pippin, etc.; four Bush Pears, including Williams' Bon Chrétien, Marie Louise, etc.; four Bush Plums, including Green Gage, Victoria, etc. These trees come into bearing at once, and, being of compact growth, take up little room in the garden.

GRAPES THE FIRST YEAR.

List Post Free. Strong canes that will bear, with ordinary cultivation, several bunches. May be fruited in pots or planted out. Black Hamburgh, the best variety for a cool greenhouse; Foster's Seedling, the best white variety. Each, **7/6**; or three for **21/-**.

STRAWBERRY PLANTS.

List Post Free. A speciality. Upwards of 50 varieties grown. Strong runners, and established plants in pots, to fruit the first season.

VOL. LIV.—No. 2,991. SATURDAY, FEBRUARY 25, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

A National Society for Daffodils.

Since the Daffodil Conference that was held at South Kensington in 1885, under the auspices of the Royal Horticultural Society, there has been a wonderful advance in daffodils and daffodil culture. The finest of the older varieties have been so largely multiplied that the bulbs have become sufficiently plentiful to admit of all who are fortunate in the possession of a garden to enjoy the varied charms of their flowers without a heavy tax on their resources. With the great increase in the supplies of bulbs there has been an immense extension in the cultivation of the more meritorious forms, not only in the private garden, but in market establishments and on flower farms, where it may be assumed they give a remunerative, if not large, return to the growers. At the present time, as for many years past, they constitute one of the most profitable crops grown in the Scilly Isles; and in Lincolnshire and Cambridgeshire, where the soil and climatic conditions are alike favourable to the development of their flowers and the ripening of the bulbs, immense areas are devoted to them. In other words, the cultivation of daffodils has during the past quarter of a century become an important industry. Concurrently with the increase in the culture of the older daffodils the raising of new varieties has been keenly carried on by amateurs and commercial cultivators, and the success achieved has been so great that the United Kingdom has become the centre of this interesting form of floricultural activity. No longer is there an occasion for those who appreciate the charm of novelty to visit Holland in quest of new daffodils, for their requirements can be amply complied with at home, and indeed, in a manner that is impossible elsewhere. Many hundreds of varieties, all more or less beautiful, have been raised, and large numbers have been distributed in the usual way. This increase in new varieties is gratifying, as evidence of the energy and skill of the raisers, but the novelties are proving somewhat embarrassing to cultivators, who are unable to visit the principal exhibitions of these flowers and become acquainted with the newer introductions. In this connection it may be mentioned that when raisers in different parts of the country are busily engaged in the production of new forms, and probably in some cases making similar crosses, there is a possibility of resemblance between certain of them, and in a few instances of this being sufficiently close to justify their being regarded as too much alike, as in the case of some other flowers. The possibility of this happening, the desirability of bringing into prominence the finest varieties in the several sections, the determination by comparative tests of the relative merits of the moderately priced varieties for various purposes, and other matters of importance have been engaging the attention of some of those who give special attention to daffodils, and it has been felt that a daffodil society, national in its aims and work would be able to render valuable service. In considering the needs for such a society, the admirable work that is being done by many local organisations, such as those at Birmingham, Huntingdon, Plymouth, and Truro, should be remembered. Probably there would be an advantage in their owing allegiance to a central body, so as to co-ordinate the work of judging, making awards to novelties, and the arrangement of competitive classes. It must also be remembered that since 1885 the Daffodil Committee of the Royal Horticultural Society has accomplished excellent work: and the heroic efforts it has made to compile a list of daffodil names, and then to classify varieties, are beyond all praise. The two chief reasons for which a society is needed appear to be a large two-days' show in London midway between the two April meetings of the Royal Horticultural Society, and an annual publication, in which matters of special interest relating to daffodils and their cultivation could be placed on record. For the purpose of considering the advisability or otherwise of forming a National Daffodil Society, a meeting was held at the Horticultural Hall on the 14th inst., but, as stated in our report, no definite conclusions were arrived at. This meeting was unfortunate in some respects, as some of the principal speakers appeared to be desirous of placing the financial responsibility, the formation of a society would involve, upon the Royal Horticultural Society. We do not think for a moment the Council will accept the responsibility and the financial burden such a society would impose. Nor does it appear desirable they should do so. It is impossible for them to give special attention to each of the more important classes of ornamental plants and flowers, and to show exceptional favour to one would certainly not be the best means of maintaining the hearty co-operation that exists between the parent and special societies. We are of the opinion that the daffodil people, if they want a society, must make up their mind to unhesitatingly assume the responsibility of finance, and be prepared for a certain amount of hard work, for unless this be done a strong and useful society is not likely to become an accomplished fact. It is highly desirable for those who attend the adjourned meeting to make up their minds as to the course they intend taking before coming to the Horticultural Hall, and thus avoid a repetition of what was done at the last meeting.

MR. G. LAING PAUL.

Mr. G. Laing Paul, whose portrait we have the pleasure of giving in this issue, is a member of the third generation of a family that for nearly a century has been closely associated with roses, and has rendered splendid service in improving and popularising these fragant flowers. As so well known to all who are actively interested in roses, Mr. G. L. Paul is a son of that genial rosarian, Mr. George Paul, V.M.H., J.P., the head of the Cheshunt firm, and would appear to have inherited in a marked degree a strong affection for the rose, and a not less strong desire to increase the interest and attractions of the flower by the introduction of new and beautiful forms. Mr. Paul had the advantage of an education of an international character, for, after completing his English education, he went to Germany, Holland, and France, which enabled him to become acquainted with Continental methods, and to acquire three languages other than his own, which, it need hardly be said, must be an immense advantage to anyone immediately concerned with the commercial aspects of rose growing. About twenty years have elapsed since Mr. Paul commenced his business career, and from the first he interested himself in roses and trees and shrubs, and, judging from his knowledge of these subjects, he was careful to take full advantage of the opportunities he had for becoming acquainted with the finer kinds. He devoted attention also to the raising of new roses, and, appreciating the importance of increasing the number of varieties specially adapted for garden decoration, he devoted his attention to the development of garden roses. Among others raised by Mr. G. L. Paul, and distributed by the firm, are Wallflower, Tea Rambler, Purple East, and Shower of Gold; the dwarf perpetual flowering Wichuraiana hybrids, such as Iceberg and Agate, and some of the newer varieties. It is now many years since Mr. Paul was elected a member of council of the National Rose Society, and on this body, and the Publications Committee of the society, he has rendered valuable service, and is highly esteemed by his colleagues.

Additions to the Royal Gardens, Kew.—Many additions to the Kew collections were made during the past year by exchanges with other gardens, and the largest consignment of new trees and shrubs received during the year was from the Arnold Arboretum. The assistant curator visited this establishment during the summer with the result that about 500 species and varieties were noted as desirable for the Kew collection. Almost all these were sent by Professor Sargent and arrived in perfect condition early in December. Among the more interesting plants were a set of American amelanchiers, several new species of North American æsculus, a set of dwarf American cratægi, about 160 Chinese trees and shrubs introduced by Mr. E. H. Wilson, a set of American and Asiatic willows, and such rare plants as Leitneria floridanum, Larix Lyalli, Kalmia caroliniana and K. microphylla, Pinus pentaphylla, Pteroceltis Davidiana, Tripetaleia bracteata, and Vaccinium membranaceum. Of special interest was a new and undescribed species of hamamelis from Missouri, remarkable as flowering in spring, like the Asiatic species; the only American species previously known, H. virginica, flowers in autumn.

Plant Physiology at the Imperial College.—The Governors of the Imperial College, South Kensington, have founded a Chair of Plant Physiology and Pathology, with a view to meet the demands of young men who are being trained to act as advisers in matters connected with agriculture and horticulture at home and in distant parts of the British Empire. They have appointed as the first occupant of the Chair Professor V. H. Blackman, M.A., Sc.D., formerly Hutchinson Research Student and Fellow of St. John's College, Cambridge, and Walsingham (Biological) Medallist of the University. In 1907 Professor Blackman was appointed to the Chair of Botany in the University of Leeds, and he has obtained a high position as an authority on rusts and other fungi, and is well known in scientific circles for his investigations of the cytological details of the fertilisation of the pine. For some years past Professor Blackman has devoted special attention to the bio-chemical and the physiological aspects of botanical science, and with these he will be chiefly concerned in the discharge of his duties as Professor of Plant Physiology and Pathology at the Imperial College of Science and Technology at South Kensington.

The Snowdrop was the subject of a most interesting paper read by Miss Philbrick at the recent meeting of the Chelmsford Gardeners' Association.

Epping Forest.—In their report the Epping Forest Committee state that the necessary work of thinning—in other words, of removing inferior and superfluous trees for the purpose of encouraging the development of more valuable specimens has been continued, each block of woodland being treated according to its needs. In 1909-10 some difficulty was experienced in disposing of the thinnings, other than whole stems. Latterly there has been a fair demand for poles, but faggots still remain a drug in the market. Most owners of woodland experience the same difficulty. The Leyton Distress Committee, the report continues, have completed the enlargement of the Hollow Pond, a work which has in many ways proved to the advantage of the general public. It is becoming increasingly difficult, the committee pertinently add, to find work on the Forest for the unemployed. A census of the deer showed an increase in the fallow deer, the approximate number being about 220, compared with 200 last year. Surveying classes were again held during the summer months by the City and Guilds of London Institute, the East London College, and the West Ham Technical Institute.

Warwick Flower Show Society.—The annual meeting of this society was held a few days since, when a report was submitted showing that the year's work had resulted in a loss of £25. There was a rather long discussion as to the advisability of holding a show during the current year, and at the close it was resolved that a committee be appointed, a full statement of the position of the society be drawn up, and an appeal be made to the residents of the town for increased financial support.

North of England Horticultural Society. The following are the members of the several committees at the present time: Scientific Committee — Messrs. A. G. Allsop, C. Crowther, Professor Seton, T. Redington, Alfred Gaut, A. S. Galt, T. G. West, P. Clapham, A. G. Ruston, J. M. Hector, T. H. Taylor, Alf. Hobson, W. H. Dobson, and Dr. Burt. Fruit and Vegetable Committee.—Messrs. J. E. Hathaway, W. E. Hyde, G. P. Bound, H. J. Clayton, E. F. Hazelton, T. Redington, Alf. Gaut, A. S. Galt, A. Cameron, H. Dolby J. P. Leadbetter, J. Easter, B. Ashton, — Gordon, and W. Pattison. Plant and Floral Committee—Messrs. G. P. Bound, W. Daniels, P. Clapham, H. Evans, A. G. Allsop, W. J. Jenning, F. H. Mountain, E. F. Hazelton, W. Mansell, T. Redington, Alf. Gaut, A. S. Galt, B. Ashton, G. Taylor, H. A. Innes, J. Donaghue, Albert Clarke, J. Artindale, G. Gibson, J. T. Barker, W. H. Hatcher, W. Pattison, A. Cameron, and W. H. Dobson. Replies have not yet been received to all the invitations that were sent out, and additions will, we assume, be made to each of the committees later on. The secretary, the Rev. J. Bernard Hall, writes: "The society is established to promote and encourage every branch of horticulture—educational, commercial, and general. This object will be attained by monthly meetings, educational lectures, co-operation with existing horticultural institutions in the North, and such publications as the council shall direct. If sufficient support is forthcoming at once, and if the keen interest already aroused is sustained, the council will immediately take steps to hold their first monthly show, and make arrangements for one or more large shows at Leeds and elsewhere in the North in co-operation with affiliated societies."

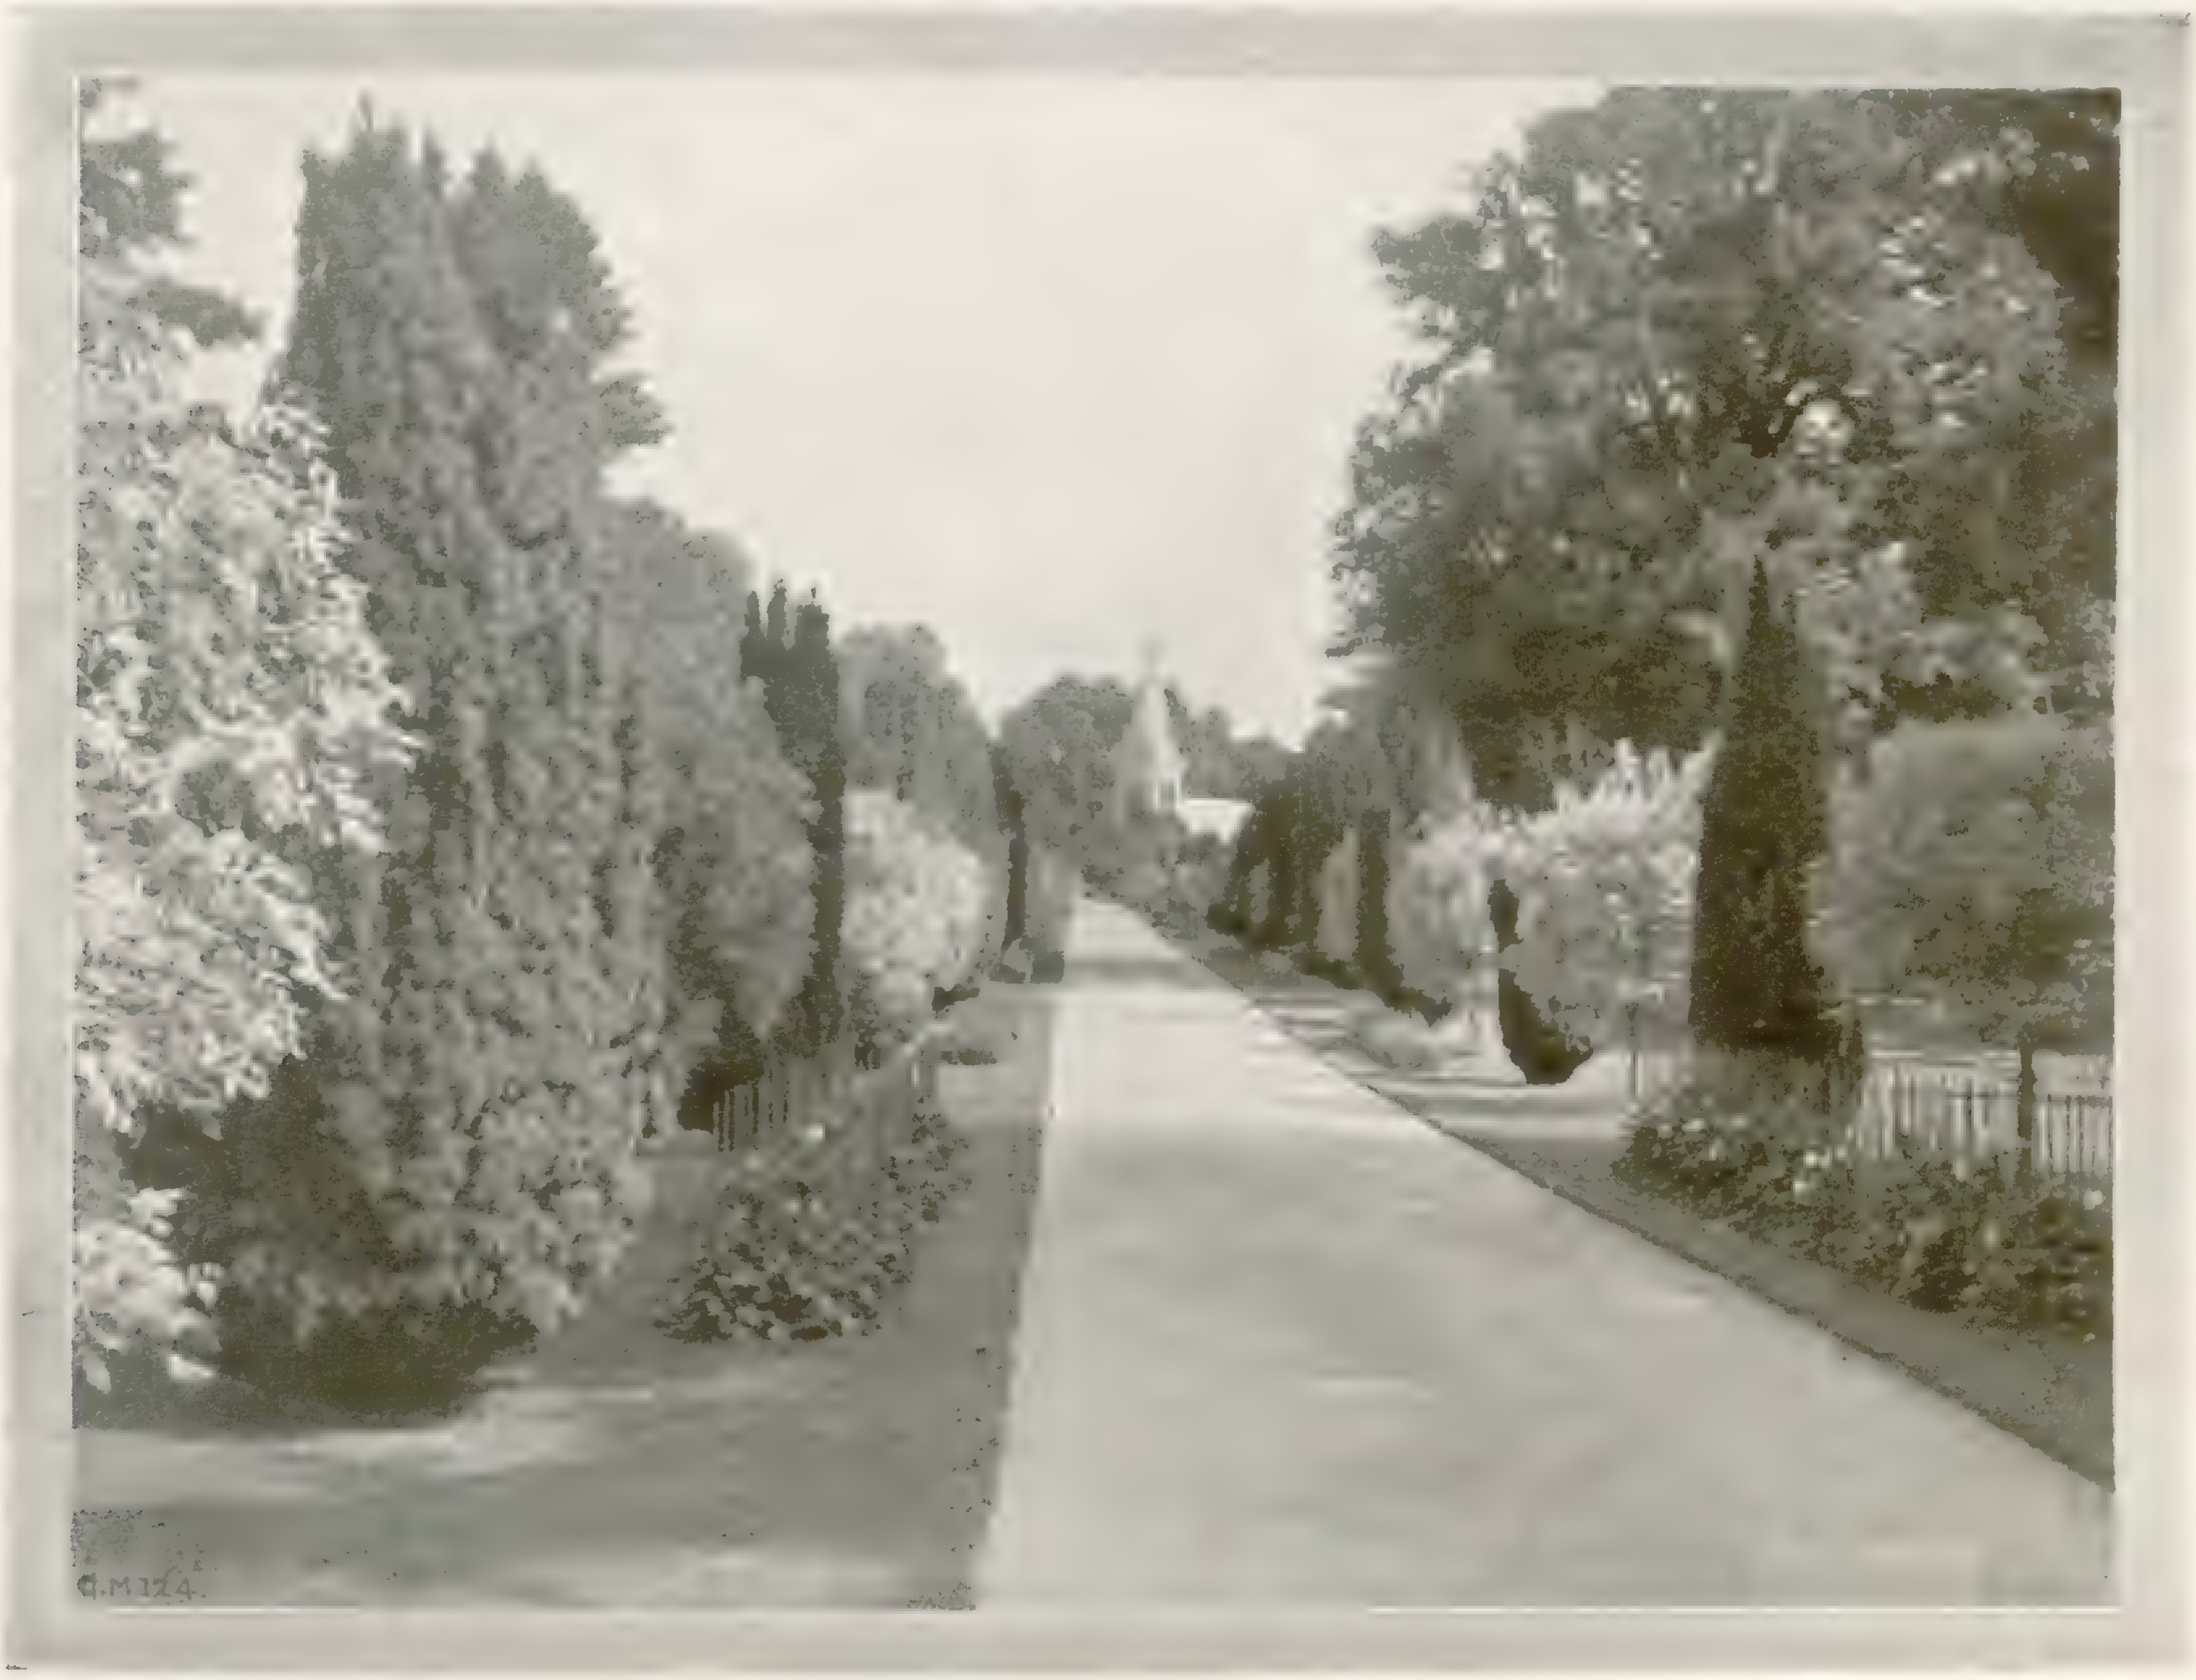
Hitchin Rose Society, which is doing excellent work in promoting the cultivation of roses by amateurs, had last year an excellent exhibition, but, owing to the wet weather, the financial results were disappointing. According to the report, the receipts were, as a consequence of these untoward circumstances, £18 less than the expenditure, but winners of prizes, the tradesmen who had done work for the society, and friends of the society, came to the rescue, and the society was by means of their generosity able to clear off the deficit, and close the year with a small balance.

Rare Snowdrops. By its appearance at a time when the garden presents few attractions, the common snowdrop has gained a special place in the affections of the nature lover, writes a correspondent of the "Scotsman." Of late years, horticulturists have devoted considerable attention to the habits of the plant, with the result that many different varieties have been described. One of these is the autumn-flowering snowdrop. This is found wild in Albania, and on some of the mountains of Greece; but Mr. Boyd, of Faldonside, near Melrose, has shown that it can be successfully cultivated in this country. In these northern latitudes the plant is later in flowering every successive season, and Mr. Boyd attributes this to a tendency to revert to what may be looked upon as the normal period of blossoming. At Fowberry Tower, and one or two other places in Northumberland, yellow spotted snowdrops have been found. In the case of this rare variety, all the parts corresponding to the green markings of the common snowdrop take on a pleasing yellow colour. It is said to require a lighter soil, and to demand much more care and attention than the common variety. A still more curious freak is the green snowdrop. This was first raised in the Botanic Gardens, at Vienna. A few years ago, a plant of this class, which had been grown at Ashiestiel was exhibited in flower at a spring meeting of the Botanical Society of Edinburgh. While it attracted considerable attention, there appears to have been a general consensus of opinion that the flower was curious rather than beautiful.

Chelmsford Chrysanthemum Society. At the annual meeting held the other evening, a highly satisfactory report for the past year was submitted to the members. Mr. W. G. Belcher, the hon. secretary and treasurer, described the exhibition as a record one, and as being especially remarkable for the high quality of the exhibits.

AN AVENUE OF YEWS AND ACERS.

Beautiful as so many of the fine old avenues in British gardens are, there is a great recurrence of the use of a few subjects. Where huge trees are desired the need for shade or for an imposing feature in the park or garden may well outweigh any wish for great variety, but where a long walk gives an opportunity of using some of the smaller-growing trees or the taller shrubs, then there is no need to adhere to the lime, elm, oak, chestnut, sycamore, ash, poplar, and other well known trees—indeed, they would often be quite out of place under such circumstances; nor should hollies, aucubas, laurestinus, rhododendrons, and a few other things be inevitably used where the big trees would be out of court. We want greater variety in these matters, and there is no good reason why two subjects should not be planted. In the present illustration a long walk is shown, and on either side are planted in pairs, the erect, stately, and somewhat sombre Irish yew, and the light-hued, elegant and free-growing Acer Negundo variegata. The two subjects look well together, the acers lighting up the sombre yews, and the yews subduing the summer light that plays so freely among the white and green acer leaves. The picture represents what has been done at Elvetham Park, Winchfield, where Mr. G. Mitchison is head gardener to Lord Calthorpe.



[Photo: F. Mason Good.

AN AVENUE OF ACER NEGUNDO VARIEGATA AND IRISH YEWS AT ELVETHAM PARK.

Leeks.—There is no necessity to coddle this crop. Make a large sowing for the main plantation at any time from now onwards. The Lyon, Musselburgh, and Ayton Castle Giant are good varieties.—C. F.

CAMPANULAS AND COLUMBINES.

Canterbury Bells.

My notes on the campanulas will in this issue be confined to Canterbury bells, as they fully deserve all the space at my disposal. They are varieties of Campanula media, which was introduced from Southern Europe in 1597, and they are popular, handsome biennials, easily grown, taking up but little space, and giving huge quantities of handsome flowers. In addition to the ordinary single-flowered Canterbury bells we have now varieties with double flowers and with semi-double flowers, the last-named being known as the Cup-and-Saucer campanula. Although both the double and the Cup-and-Saucer (Campanula calycanthema) varieties find admirers, none are equal, in my opinion, to the purely single forms of C. media. In addition to those with pink, mauve, white, or blue flowers, striped and spotted varieties are now available.

In addition to their use as border flowers in June and July, Canterbury bells can be grown in pots for an early display in the conservatory, by potting up a sufficient number of the strongest plants from the open border early in October, keeping them in a cold frame for a time, and then removing them to the greenhouse early in the spring.

Cultural details are but few, and can be briefly stated. An open site, ordinary soil well manured, and early planting are the essential conditions; and, with reference to these, it should be said that upon the period of planting depends the measure of success. It frequently happens that the plants are puny and weak, owing to sowing the seed too late or too thickly, or in not transplanting them early from the seed bed. If they are not sturdy and well supplied with leaves in the autumn it will be useless to expect a full crop of the finest flowers when blossoming time comes round.

April is a good time for sowing the seed on deeply-dug and well-prepared soil in the open, sowing thinly, so that the plants can grow vigorously from the commencement, and make a short-jointed growth. When the seedlings are large enough to handle transplant them, putting them 10in. apart in rows, with 15in. spaces between them, choosing showery weather, so that growth starts away vigorously. Keeping the bed free from weeds during the summer is all that is necessary. Early in October the plants should be lifted, with a good ball of earth about the roots, and be planted where they are to flower.

If the site in which they are to bloom is available when transplanting from the seed-bed, they should then be placed in their permanent quarters, as a saving of time is effected, and no check is received. This, however, is not always possible, and, if the plants are well prepared, this extra shift does not interfere with their progress.

Columbines.

The common columbine (Aquilegia vulgaris) is an English plant that is quite plentiful in some parts of the country, and is really handsome when seen in breadths in the woods, where it grows and blossoms annually if unmolested. But even here, in this remote part of the country, we find these beautiful wild flowers less frequent, owing mainly to depredations by flower-lovers, who dig them up for planting in their gardens. But somehow they seldom, if ever, appear to succeed as well as they do in their native habitat.

For early summer flowering, aquilegias raised from seed are much admired, and are extremely useful, giving as they do huge crops of flowers with but a minimum of trouble. Aquilegia glandulosa, or Siberian columbine, introduced in 1822, is extremely pretty, growing from 6in. to 12in. high, with its blue and white flowers; but, unfortunately, it is not sufficiently hardy to withstand our severe winters. The more useful forms are those of A. caerulea and A. chrysantha, with their long spurs, as well as the long-spurred hybrids in selected colours of pink, mauve, pure white, crimson, and gold, which are perhaps the more useful for special effect in masses of one colour. For filling gaps in the herbaceous border aquilegias of all types and colours are most useful.

As with all seedling plants, the main point is to sow early, and obtain increased vigour. Sow the seed thinly in boxes in March in the greenhouse or cold frame, the aim being to start the plants early into growth. If the convenience of glass is not available, select a warm site in the open. Well prepare the soil, and the method is to dig it deeply in the autumn, previously adding some half-decayed manure, and leaving the surface quite rough. The soil should be forked over early in the spring, and at the beginning of April sow the seed thinly, covering it with a sandy compost and shading from hot sun during the middle of the day if the weather is hot and dry. Transplant early into the beds and borders in which they are to bloom, if possible, which is seldom the case. Otherwise give the seedlings ample room to grow sturdily until the early part of October, when they should be replanted where they are to bloom the following summer. E. M.

TUBEROUS BEGONIAS AND GLOXINIAS.

Begonias.

The one great secret of successful begonia culture lies in growing them as cool as possible. Of course, heat is required to germinate the seeds, but once the plants have attained some size it is far better to remove them to cooler quarters. As begonia seeds are slow in germinating an early start should be made. Sow in well-drained pots or pans in very light sandy soil. The seeds, being very small, should be sown on the surface, and not buried. Cover the pan with a sheet of glass, and place in a shady corner of a house with a temperature of 60 degrees. Do not allow the soil to become dry, or failure will result. As soon as large enough to handle prick off the seedlings into boxes or large pans, and when ready again pot them, using a fairly rich compost. As soon as the plants become established in these pots remove them to a cooler temperature.

A SEEDLING BEGONIA FROM A GOOD STRAIN.

The cultivation of begonias from tubers is much simpler. About the end of February, or beginning of March, put the tubers singly in pots, according to their size, and stand them in a cool greenhouse, and water sparingly until growth has commenced; after this the water supply may be increased gradually, so that when in full growth they may receive an abundance. When ready shift them into larger pots, making the soil firm. A mixture of good loam, leaf-mould, and sand, with the addition of manure from an old mushroom bed, forms the best compost. See that the pots are well drained. Abundant air and good light are essential, but begonias should be shaded during the hottest part of the day. An increase of stock may be obtained by cutting tubers which have several eyes, leaving a few eyes on each part. The cut portions should be allowed to dry, preferably in the sun, and the cut surface be thickly coated with powdered charcoal before potting. Afterwards treat the same as whole tubers.

One of the chief enemies of the begonia is a small mite, almost invisible to the eye, but which works havoc on the foliage. Its presence will be made known by rusty marks on the foliage, and it must be checked by frequent fumigation and dusting with tobacco powder.

When the flowering season is over gradually reduce the water supply until the growth dies down, by which time the soil should be dry. Shake out the tubers and store them in a dry, cool place during winter.

Gloxinias.

The range of colour to be obtained in gloxinias makes them most desirable subjects, and well worth growing properly. They succeed best in a warm, moist house, and may be had in flower throughout the greater part of the year. Tubers should be started in boxes in February or March, and when growth has commenced they must be potted, using pots as small as possible. Syringe the plants on all favourable occasions, and maintain a temperature of 65 degrees. As soon as well rooted shift into larger pots. For general use 48's and 32's will be found large enough in which to flower the plants. Use a compost of rich fibrous loam, peat, leaf-soil, and sand, adding some broken charcoal to keep the whole sweet. Shading from sunshine is necessary, and care must be taken to avoid cold draughts.

Plants raised from seed will flower later in the season than those grown from tubers. It is a good plan to make a sowing early in February in a light sandy soil, and place in a temperature of 65 to 70 degrees. When large enough to handle prick off the seedlings into boxes or pans, which have been well drained. When potting the plants from the boxes do not pot them all at one time, but rather make several batches to extend the flowering period.

All plants, when in vigorous growth should receive weak liquid manure occasionally. After flowering gradually reduce the water supply, and when the tubers are dried off store them away in a moderately cool dry place.

A. Grubb.

Azalea Deutsche Perle.—Where white-flowered azaleas are needed early in the season this is one of the best of all to grow, as in a greenhouse temperature of 50 to 55 degrees it may be had in bloom by Christmas. The flowers, too, are of considerable substance, and though semi-double when fully expanded, they are in the bud state just like little rosebuds. This azalea is of rather looser growth than many of the garden varieties, owing to which the trusses of flowers can be cut with longer stems than many of them can. There is no other variety of which such numbers are sent to this country as Deutsche Perle.—W. T.

CHOICE NEW HARDY PLANTS.

ACONITUM WILSONI, immense spikes of pale sky blue flowers, **9d.** each; **7/6** doz.

ACONITUM FISCHERI, violet blue with bright shining foliage. **6d.** each; **4/6** doz.

ANCHUSA OPAL, pale blue. **9d.** each; **7/6** doz.

ARTEMISIA LACTIFLORA, fine plumes of white flowers, almond scented. **9d.** each; **7/6** doz.

ASTILBE ARENDSII SALMON QUEEN, graceful spikes of light salmon pink. **2/6** each.

ASTER BEAUTY OF COLWALL, fine double lavender. **9d.** each; **7/6** doz.

ASTER STAR SHOWER, creamy white form of Hon. E. Gibbs; very decorative. **9d.** each; **7/6** doz.

ASTER NOVELTY, pale lavender, shaded pink, small flowers, completely covering the plant; A.M., R.H.S., 1910. **9d.** each; **7/6** doz.

ASTER CLIMAX, the finest of the Nova Belgii type, flowers measuring fully two inches across. **9d.** each; **7/6** doz.

ASTER ST. EGWIN, a beautiful shade of bright pink, a neat plant. **6d.** each; **4/6** doz.

CHRYSANTHEMUM MAXIMUM, complete collection. 12 fine varieties for **4/6.**

DELPHINIUMS, all the newest and best are grown.

GEUM MRS. BRADSHAW, enormous flowers, dbl. crimson. **1/3** each.

HELENIUM RIVERTON GEM, large flowers of a wallflower red. **6d.** each; **4/6** doz.

HELENIUM RIVERTON BEAUTY, a fine companion to Riverton Gem, but a bright yellow. **6d.** each; **4/6** doz.

LITHOSPERMUM HEAVENLY BLUE, a bright sky blue, a splendid addition for the rock garden or front row of herbaceous border. **1/3** each.

ORIENTAL POPPIES.—
- **MRS. PERRY,** orange apricot. **9d.** each.
- **PRINCESS ENA,** pale salmon. **6d.** each.
- **BOBS,** silvery pink. **9d.** each.
- **MARIE STUDHOLME,** salmon flesh. **6d.** each.

We can supply 12 choice varieties of Oriental Poppies for **4/-.**

LUPINUS MOERHEIMI, the finest and most compact of the pink shades. **6d.** each; **4/6** doz.

GALEGA NIOBE, finest white to date, recommended. **1/-** each.

GALEGA HER MAJESTY, this variety gives flowers of a bright rose colour. **1/-** each.

GALEGA CARNEA PLENA, double rosy carmine. **9d.** each.

PHLOXES.—We have a fine collection, and offer best value in the trade.
- **LINDFIELD BEAUTY,** bright salmon pink of largest size. **1/6** each; **15/-** doz.
- **FRAU ANTONIN BUCHNER,** finest white; A.M., R.H.S., 1910. **9d.** each; **7/6** doz.
- **C. A. STROHLEIN,** orange scarlet, carmine eye, of finest form. **1/-** each; **10/6** doz.
- **GEN. VAN HEUTSZ,** salmon red, white centre, very attractive. **9d.** each; **7/6** doz.

12 choice varieties for **6/-.**

SIDALCEA LISTERI, a beautiful variety of a flesh pink shade. **6d.** each; **4/6** doz.

RUDBECKIA GOLDSTRAHL, very double bright yellow variety, growing only 4ft., and flowering earlier than Golden Glow. **6d.** each; **4/6** doz.

POTENTILLAS. 12 choice named doubles for **3/-.**

SAXIFRAGAS.—We have a good stock of the best new varieties—Decipiens Bathoniensis, Clibrani, Codsall Cream, etc., good plants. **1/-** each; **10/6** doz.

VIOLAS.—A large collection to offer in exceptionally good stuff.

We were awarded Silver Gilt Banksian and Silver Gilt Flora Medals, R.H.S., for Hardy Plants, in Autumn, 1910.

WE HAVE AN IMMENSE STOCK OF HARDY PLANTS AT REASONABLE PRICES.

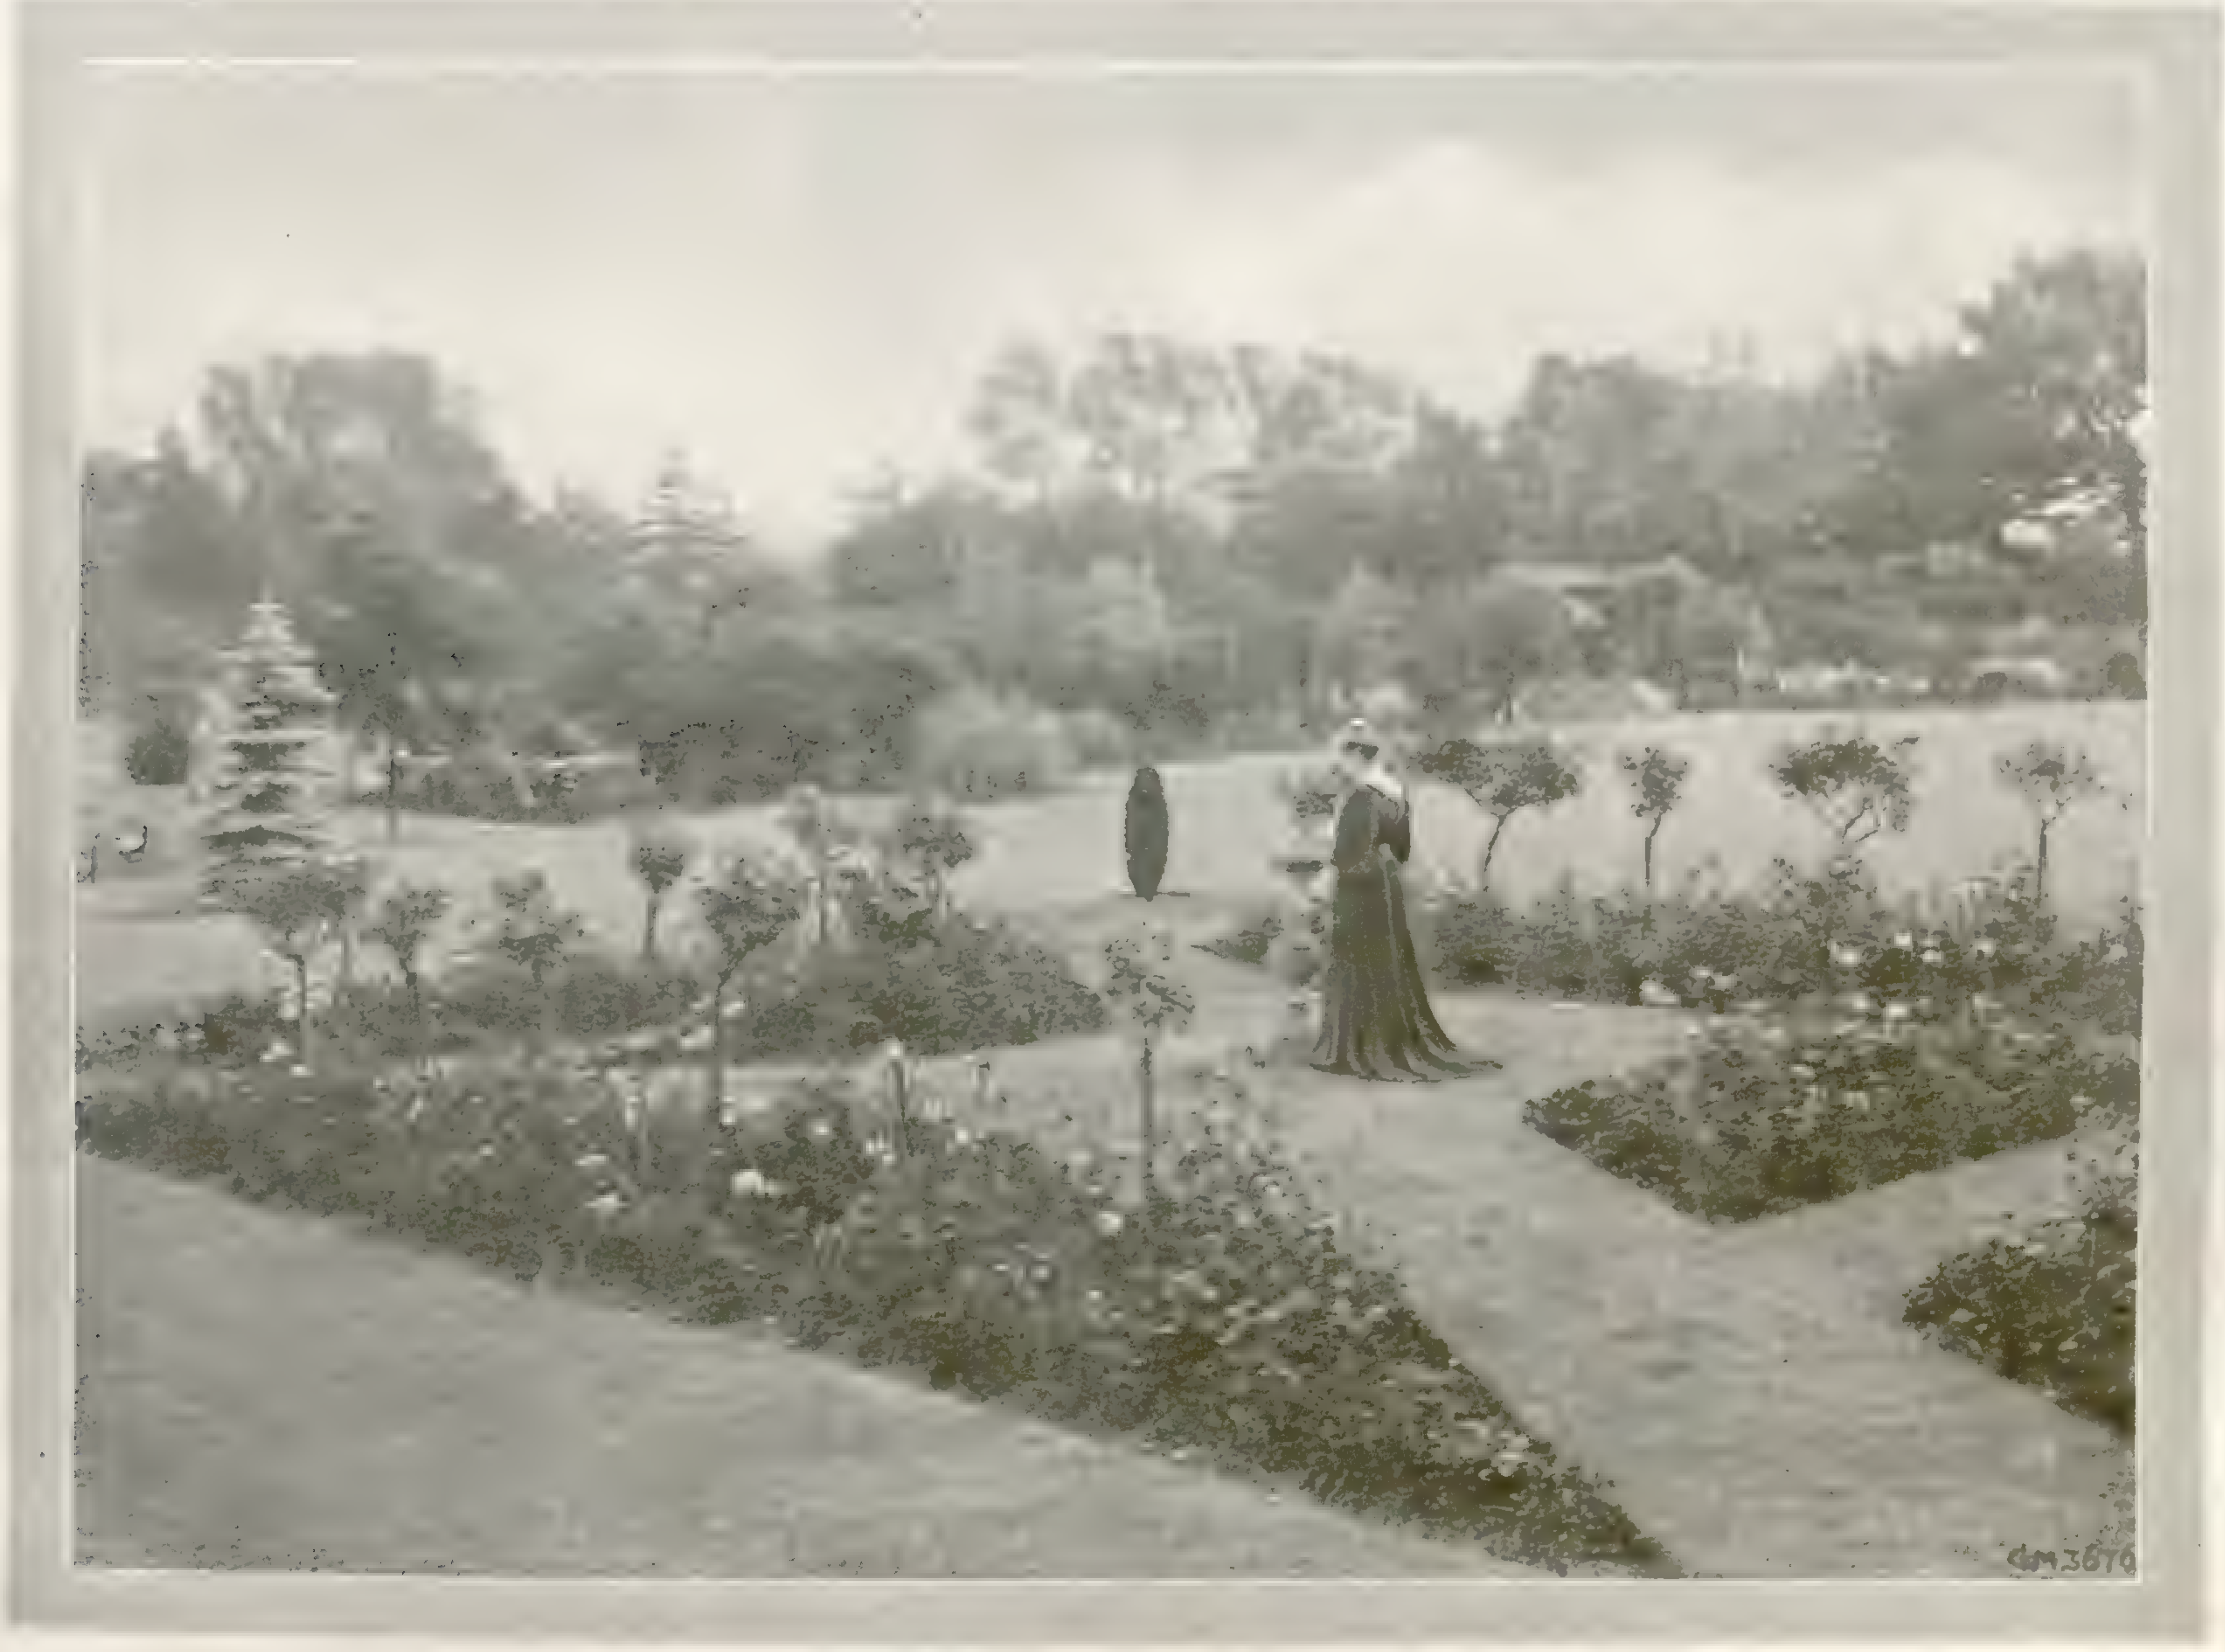
A SIMPLY ARRANGED ROSE GARDEN.

In generalising on rose garden design it should be stated that in all cases the plan should be carefully adapted to the environment of the area to be devoted to rose culture, with a view to ensure a proper degree of unity between the several parts. In some cases the surroundings will be such as to necessitate a somewhat elaborate design in which arches, pillars, and, it may be, a pergola, will have a prominent place. In others a design characterised by simplicity will be more appropriate, as in the case of the attractive rose garden at Home Place, Limpsfield. Here, as will be seen from the illustration, is a large breadth of open lawn that is embellished on the margin with borders of hardy flowers. There is nothing ornate, and therefore no design could well have been more appropriate in which quiet beauty is the dominant feature than a geometrical scheme in which the beds are large in size, regular in outline, and have good breadths of turf between them. The design is not only in keeping with the surroundings, but it has the advantage of affording facilities for growing the roses under the best possible conditions and of enabling the mowing machine to be readily used in the grass paths. We have been told again and again by writers of experience that flower beds cut on the grass should have wide alleys between them, and be free from irregularities in outline, and thus admit of the mowing machine being able to do all that is necessary in keeping the grass short. In the design before us we have the value of this advice admirably exemplified. It has another distinct advantage, inasmuch as the beds are of such size as to enable an effective combination of dwarf and standard roses to be grown in association, and to afford ample space for the free extension of the roots in search of the food essential to the production of ample leafage and finely developed blooms. The sun-dial in the centre is an added attraction. We know not what motto the dial bears, but, as we look at the fair scene depicted, we cannot imagine one more appropriate than

> "Let others tell of storms and showers,
> I'll only count your sunny hours."



ROSE GARDEN WITH SUNDIAL, HOME PLACE, LIMPSFIELD. [Photo: F. Mason Good.

THE TOMATO IN SCOTLAND

This eminently useful, and withal easily cultivated subject, class it at will—fruit or vegetable, is almost indispensable, both in its cooked and natural state in many establishments, and unpleasantness is apt to arise if from any cause a greatly diminished supply should occur.

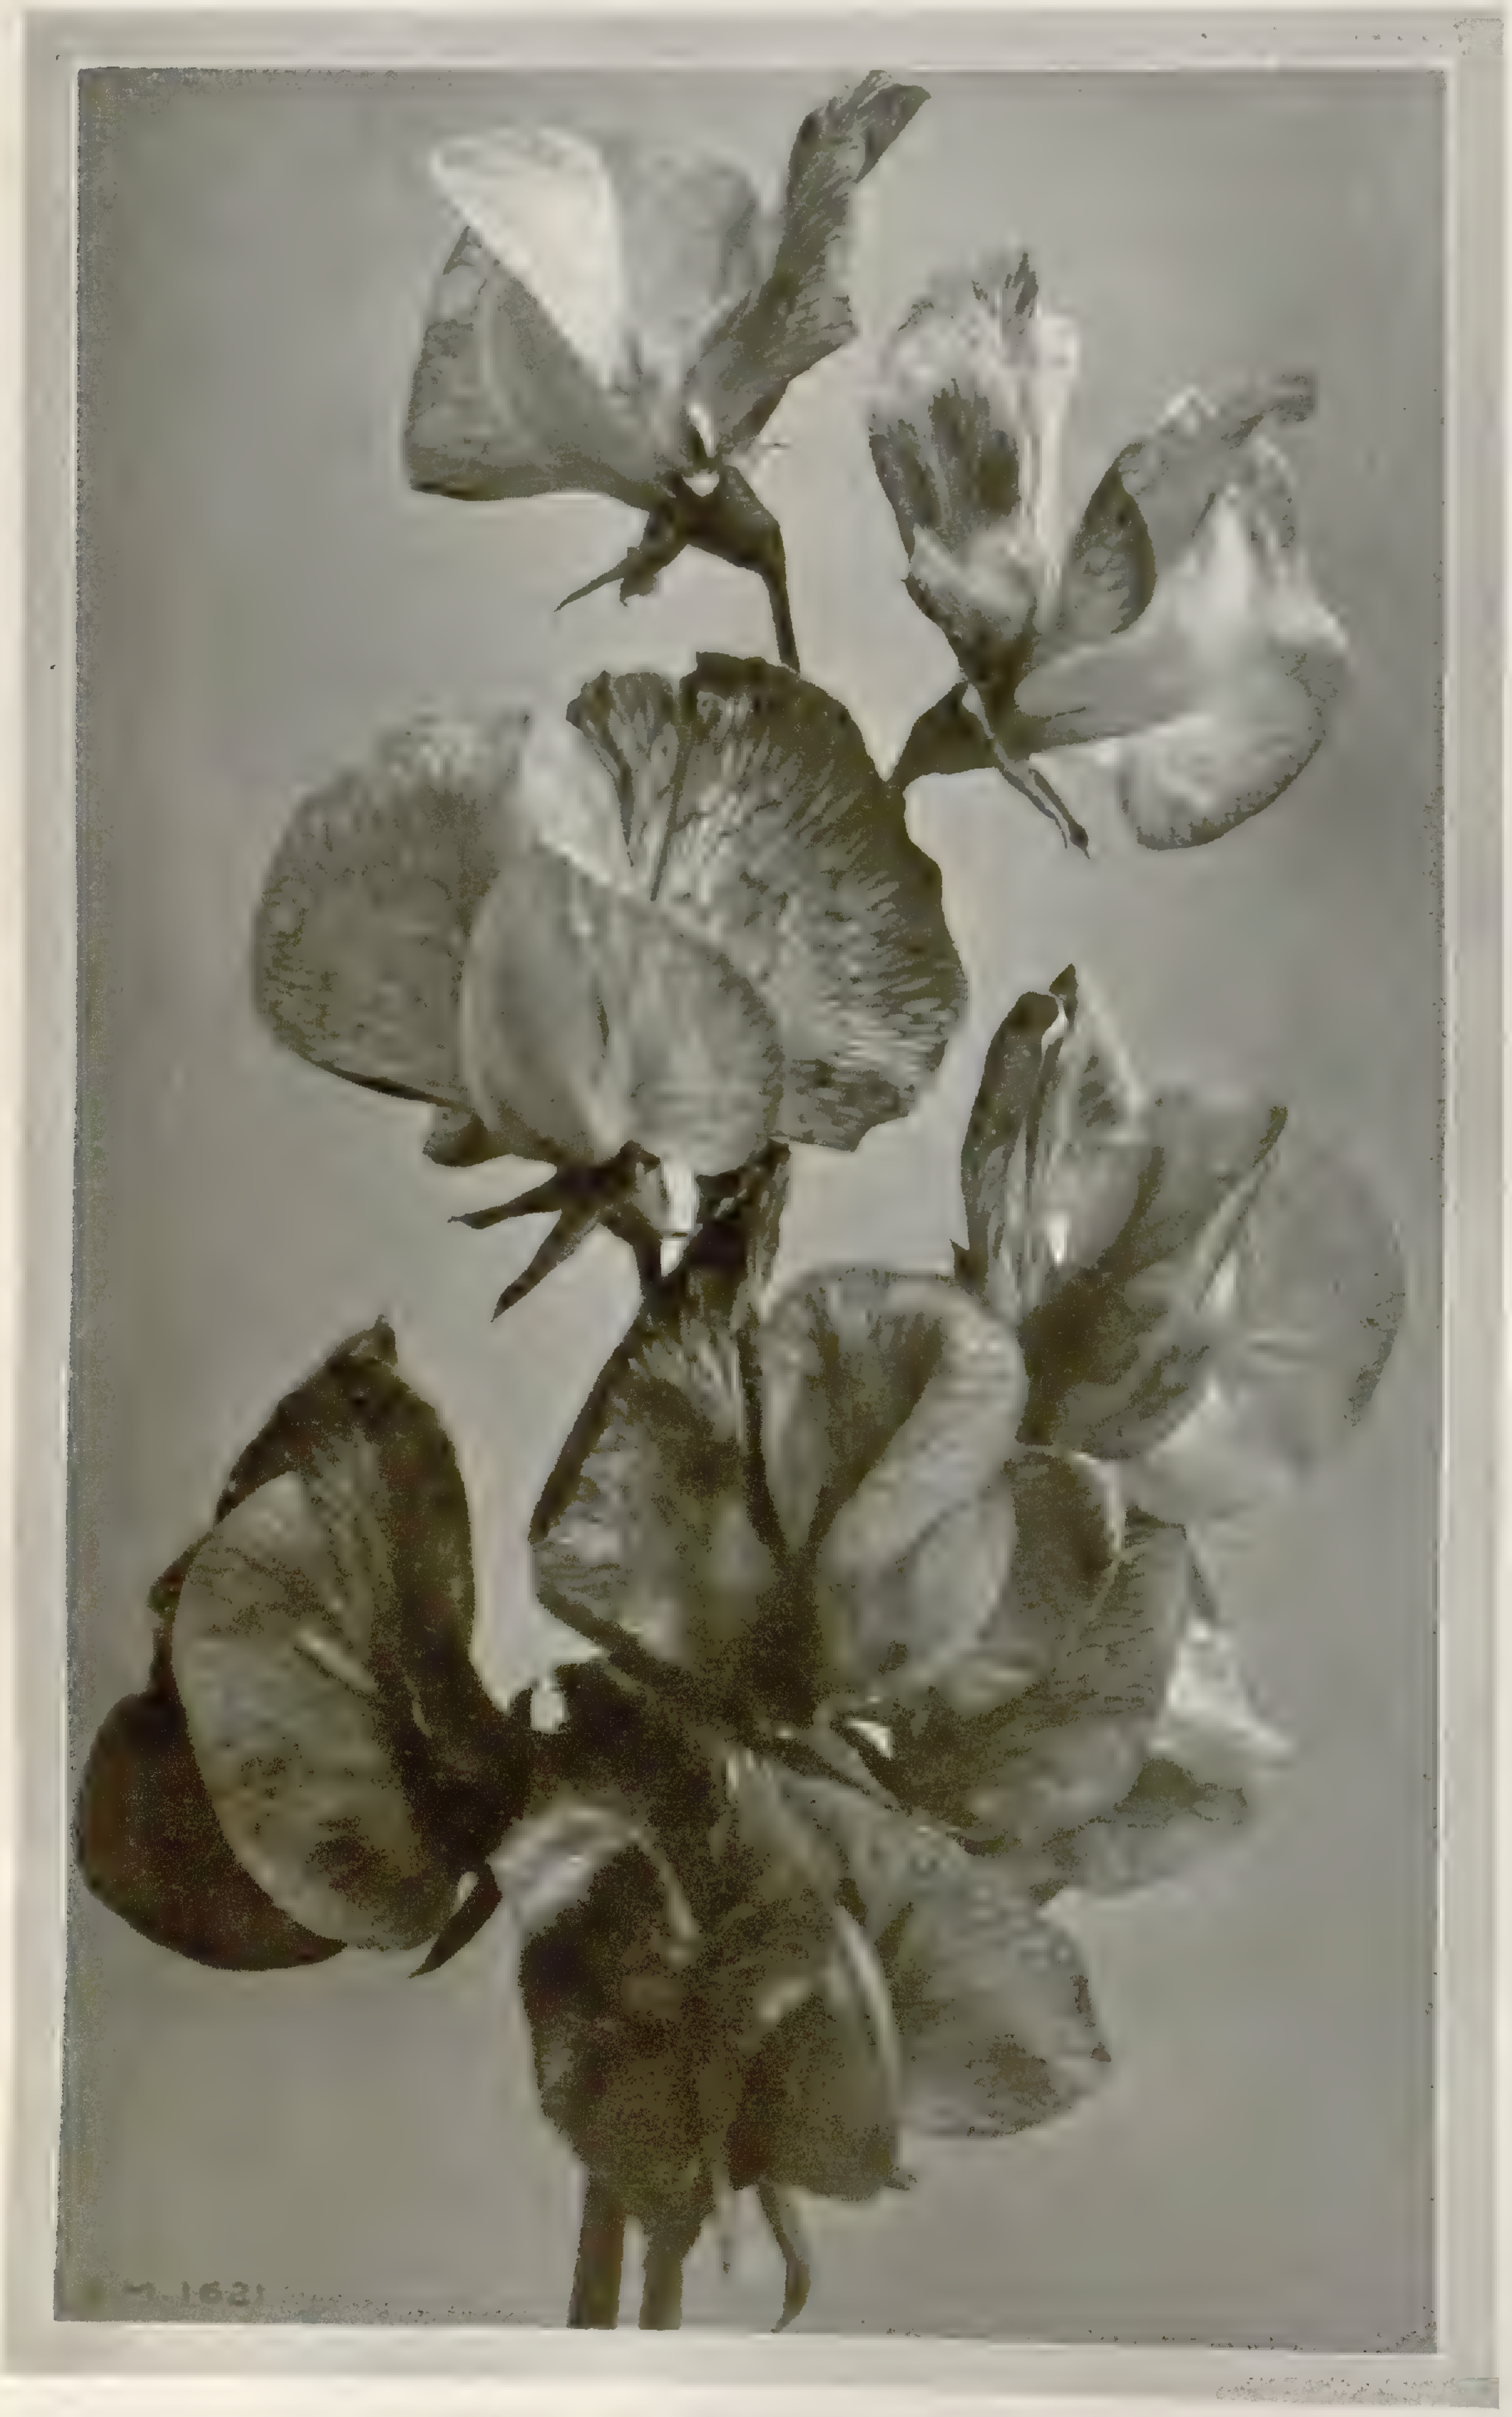
Where well constructed and efficiently heated houses are sufficiently plentiful it is not a difficult matter to maintain the supply of fresh fruit throughout the year, though such, matured in the short and often sunless days of winter, is very inferior in quality to that of midsummer and autumn.

In Scotland the successful culture of the tomato in the open air is not impossible, providing a wall having a south aspect and fully exposed to the sun can be afforded, but even then very much depends upon the season, for although the growth of the plant and the setting of the crop may be all that is desired, the ripening of the greater part of the fruit has to be accomplished after its removal, and by artificial means.

Anyone interested in the horticultural progress, or, for that matter, in the healthiness and prosperity of the Scottish people, cannot fail to have noticed the greatly extended trade that has developed in recent years in connection with the tomato. Extensive ranges, or, rather, plantations, of glass houses, devoted almost entirely to this crop, are now common where nothing of the kind existed before; and although prices are not so high as formerly the demand for the fruit has increased enormously, which, together with better appliances and improved methods of culture adopted, makes this the most remunerative of any fruit crop the market grower at the present time can cultivate. It may also be remarked that Scottish grown produce commands a higher price in retail establishments than any other, but whether the difference in quality is real or merely sentimental I cannot affirm; the advance, however, though at times but fractional, at others more substantial, is a reality all the same, and undoubtedly acts as an incentive to the grower.

General Culture.

To the great majority of private gardeners no specially constructed houses for the culture of the tomato are available, yet excellent crops, extending over a long season, are annually produced in pits, frames, and other structures, that for a good portion of the year do duty for widely diverse subjects. For instance, in vineries, there is often more space upon back walls than is required for the various shade-loving plants, and against such the tomato, if duly prepared, and planted in time may be depended upon to give a better return than most fruits. To do this the seed should be sown in February, and the resultant plants be grown steadily, as near the glass as possible, in a house or pit where the temperature seldom falls below 55 degrees. Repotting, using slightly warmed soil, should be done from time to time as the roots show around the inside of the pot, until pots with a diameter of about six inches are reached. The best soil in all stages is a good fibrous loam, to which a little leaf-mould, lime rubble, or sand may be added, according to its richness and texture. Endeavour to keep the plants sturdy, and flower trusses will appear as the last-named pots get filled with roots, and when these open fertilisation by means of a soft brush should be resorted to. If the permanent position is the back wall of a vinery or peach house the plants should be ready for planting soon after the house is closed to encourage growth upon the fruit trees, so that both advance together. The tomatoes, having the start, will thus make considerable growth, producing flowers and fruit in due order, while the earliest formed will probably ripen before the overhead foliage gets very dense. If plants are sufficiently numerous it is best to place these about twenty inches apart, and train up a single stem, breaking out all side growths as they appear; whether the leader is stopped or not may rest with the cultivator, but in lofty houses a thin attenuated growth may at length be manifest, if allowed to extend, owing to excessive heat and shade, when further upward progress is useless.



SWEET PEA PRINCE OF ORANGE.
A brilliant orange variety, raised and distributed by Miss Hemus.

Pits and Frames.

As these are not generally available until the bedding arrangements are complete, towards the end of May, if tomatoes follow these plants, they must not be raised too early, nor yet in greater numbers than accommodation can be provided for without overcrowding. For planting at the period named the early part of April is sufficiently soon to sow the seeds, as better results are obtained from small sturdy plants than from those double the size, long-jointed and slender. Presuming that the rooting medium is in fairly good condition, manurial stimulant in any form is unnecessary until a full crop of fruit is set, when a slight application of some approved compound is helpful. Water should be sparingly applied during the earlier stages, but plentifully when a full crop is assured.

Insects and diseases are not prevalent, nor yet very troublesome to the plants. Green and white fly may appear, but are easily dispersed by the usual methods of vaporising. Fungoid diseases are much more formidable foes, but ill-effects are almost nullified by removing the affected foliage as soon as an attack is observed.

Varieties are now very numerous, those possessing the deep red tint being most popular, while smoothness of outline is a pleasing feature, particularly for exhibition purposes. For very early use the cluster fruiting, or such moderate-sized varieties as Prolific or Supreme are best, while for main crops a well-selected type of Perfection is perhaps unequalled for general use.

JAMES DAY.

TWO GOOD NEW SWEET PEAS.

Prince of Orange.

Miss Hemus, of Holdfast Hall, Upton-on-Severn, has raised many beautiful sweet peas, and among those of brilliant hue the new Prince of Orange must take a high place. The original stock, distributed in 1910, was not quite fixed, but the new stock now offered is fixed, and Miss Hemus does a rather handsome thing when she states: "I regret the stock of this variety, which was sent out last season, proved unsatisfactory as regards fixity, and I shall be pleased to replace it, free of charge, with the true stock to all those customers who bought it last season, if they will return their last season's invoice with their order for this season." Prince of Orange is a brilliant orange-scarlet variety, giving large, handsome flowers, usually four on a spike. The raiser considers it identical with the variety Thomas Stevenson, consequently comparisons between the two will be looked forward to with great interest.

Sunproof Crimson.

The very fine sweet pea to which reference is here made is Dobbies' Sunproof Crimson, a brilliant sweet pea exhibited by Messrs. Dobbie and Co., of Edinburgh, at the exhibition of the National Sweet Pea Society held in 1908. In the following year the variety was tested in the N.S.P.S. trials, then at Reading, and an Award of Merit was granted, but as so little seed was saved the distribution of seed was not possible in the autumn of that year or in the spring of 1910, but a good crop was secured last autumn, and the variety is now on the market. Meanwhile a sweet pea of similar name has been distributed, but it is only since the autumn of 1910 that the certificated stock has been available. This brilliant crimson variety has, so far as our observation goes, merited its title of "Sunproof." and we can only hope that this Coronation year of 1911 will yield sufficient of what we used to call "Queen's weather" to give the variety a severe test. We may add that Dobbies' Sunproof Crimson sweet pea has not only secured the Award of Merit of the National Sweet Pea Society, but also a similar award from the Royal Horticultural Society, and a First Class Certificate from the Scottish Horticultural Association.

PRIMULAS AND CYCLAMEN.

Undoubtedly primulas and cyclamen rank as two of the leading kinds of flowering plants for the embellishment of greenhouses and conservatories. Not only are the flowers and foliage exquisitely beautiful, but the former continue to appear on the plants over a long period. If some seeds are sown in February or March, and again in May or June, and, in the case of cyclamen, in August or September, a succession of bloom may be had for nearly nine months, commencing in October.

During the past few years a great improvement has been effected by our expert hybridisers in the strains of both kinds of plants. There is a greater range of colour in the flowers; the latter are larger, and the habit of the plants is better.

Primula sinensis.

The first sowing of primulas may be made in February or March, and the resultant plants will begin to flower in October, and, if well managed, continue to do so until the early part of spring. The primula delights in a moderately moist soil, so that pans or pots are better for sowing the seeds in than boxes. Pans should be preferred; put in clean crocks to ensure drainage, and use a compost of old fibrous loam and leaf-soil in equal proportions, with coarse sand to render it all porous. Rub the loam to a rather fine state, but do not sift it; pass the leaf-soil through a half-inch mesh sieve. Three parts fill the pan with the compost, and press it down moderately firm, make the surface quite level, then water through a fine-rosed watering can. One hour afterwards sprinkle some dry silver sand on the soil, and then sow the seeds about one inch apart. Do not water again immediately, but simply scatter a very thin coating of fine compost on the seeds—just covering them.

At this season it will be advisable to place the seed pans in a house with a temperature ranging from 55 to 65 degrees, and to supply all water necessary by dipping the base of the pans in tepid water.

The germination of the seeds is nearly always irregular, therefore care must be taken when lifting forward seedlings so as not to disturb those just breaking through the soil. Transplant the seedlings in pots or pans, placing them two inches apart, near the rim. At this, and the subsequent pottings, some old mortar rubble should be added to the compost, a seven-inch potful to a bushel of the soil. Use clean pots, and always keep the immediate surroundings of the plants clean and sweet. During the summer the plants must be grown in cool frames, and also the seedlings that are raised in May or June. Good light is essential, but the frames should have a north aspect, and be slightly shaded from the sun's rays. The plants do well on a hard, moist bed of ashes. In fine weather, during July, August, and September, the plants should be exposed fully during the night-time, and also on dull days when it does not rain. Clear soot water is beneficial when primulas are well rooted. Stimulants must always be given in a weak state rather than in strong doses.

Primulas and cyclamen do best in low houses, where they can be well grown and flowered if not subjected to cold draughts.

Primula stellata.

This section has a high decorative value, and requires the same treatment as Primula sinensis; but the plants will look better in vases in a dwelling-room, and the cut flowers are lovely in vases, being so light and graceful.

Cyclamen.

These require much the same kind of treatment as primulas, and it always pays to have young stock coming on instead of depending upon old corms. The latter, when quite sound, are very serviceable, and well worthy of good cultivation. Last April I saw a large batch growing in seven-inch pots, nearly every specimen having between seventy and one hundred and twenty blooms—of great size, too.

SWEET PEA DOBBIE'S SUNPROOF CRIMSON.
Flowers large, waved, brilliant crimson.

The first sowing should be made in August or September, and the resultant seedlings kept growing in a structure heated to about 50 degrees. The second sowing must be made in February in a temperature of about 60 degrees. Sow the seeds in pans filled with fibrous loam and leaf-soil, with sand to secure porosity. Allow a distance of one inch between the seeds, and bury the latter half an inch deep. Apply water as suggested in the case of the primulas, and until the seedlings appear keep the surface covered with a thin coating of fine leaf-soil. Cyclamen seeds germinate more irregularly than those of primulas.

The crowns of the corms must always be left clear of the soil. Six-inch pots are large enough for the final potting. Maintain the temperature as evenly as possible, never subjecting the plants to excessive heat. Rotten manure should be mixed with the potting compost, and feeding be done only when the pots are well filled with roots.

Full light is essential both in summer and winter, but the plants must not be fully exposed to the sunshine in summer. Light syringings with clear soot water are good for the growth of the plants, and keep them free from insect pests in summer time. To be successful the cultivator must keep the plants growing freely from the seedling to the flowering stage.

George Garner.

STOCKS AND ASTERS.

The subjects of these notes are unsurpassed for beauty, floriferousness, and general utility among annuals employed for garden decoration. The first-named has ever enjoyed universal popularity, and small wonder, seing that it boasts a combination of great beauty and delicious fragrance. In these days it is given prominent positions in summer bedding arrangements, and when the floral beauty is past, celosias, dwarf dahlias, early flowering chrysanthemums, etc., step in and fill the breach. The cultural requirements of the stock are of a simple order, and, incidentally, few gardeners cultivate them upon a more extensive scale than the writer.

The seeds should be sown in shallow boxes upon a partially spent hotbed, about the middle of March, and when the true leaves are formed, the seedlings must be transferred to fairly deep boxes, put four inches apart, and returned to the warm frame until considerable growth has been made, or the plants meet. It will occur to the cultivator to arrange the plants close to the glass from the outset, and also to harden them off in a gradual manner, always bearing in mind that to achieve a full measure of success continuous growth is essential. In view of the fact that stocks are very impatient of root disturbance, and to prevent premature flowering, a liberal quantity of leaf-soil and cocoanut-fibre refuse should be incorporated with the soil employed in boxes; this ensures a large body of soil being attached to the roots on transference to permanent quarters. It is true the seedlings may be placed in small pots, and it is equally true that time, labour, and space will not allow such a practice in many instances. The best kind of soil is a fairly retentive loam, with lime rubble and manure added, and provided they are mulched with manure, and the ground is saturated occasionally in times of drought the season of beauty is lengthened to a very appreciable extent, while the labour involved in affording the plants a shower bath, preferably in the evenings, while making their growth, will be amply repaid by the creation of extreme vigour.

The foregoing remarks also apply to asters, with the exception that they transplant readily enough, and, it may be added, are very susceptible to attacks of aphis. Failing prompt eradication of aphis on its appearance, all chances of success are thrown to the winds. It may prove of service to those whose space is very restricted, to point out that good results may be had by sowing the seeds upon a very shallow hotbed formed upon a south border, about the end of March. The bed should be surrounded with mats fixed to poles, and if the seeds are arranged at four inches apart in drills, an exceedingly sturdy lot of plants will result without further attention beyond watering.

It is hardly necessary to dwell upon the merits of the various sections found in both stocks and asters, but it may be said that the Giant Branching ten-week stocks are eminently adapted for large beds or great stretches in the borders, while for small beds, the dwarf section is to be preferred. Named varieties of great beauty and merit are found in Carter's Monarch, which produces upon a single 2ft. stem flowers of good size and great purity. Triumph, in brilliant crimson, and wonderfully vigorous growth, is a splendid acquisition, while the popular Princess Alice is a continuous bloomer. The secret of success in bringing the biennial kinds through the winter in the open garden is to grow them in rather poor soil with plenty of lime rubble added.

The single asters supply capital decorative material as cut flowers, and each and all of the double sorts should be represented to demonstrate their value as garden plants.

Walter H. Aggett.

A FINE BED OF MONT BLANC STOCKS AT SOUTHWARK PARK.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

MELONS.

The melon is one of the most commonly grown of hothouse fruits, and for some reasons deservedly so. It is by many greatly valued, especially during the warmest season of the year, at which time, fortunately, it can be most easily obtained, and this at its highest degree of perfection. Its crops, moreover, reach the state of maturity in a comparatively short space of time, and are thereby the more easily accommodated, and also produced at a comparatively small cost.

Raising a Stock and Forming Beds.

Being a sun-loving subject its culture may be simplified if the structures devoted to it are in sunny positions, this being particularly important for early and late crops, for which efficiently heated small lean-to houses, having the surface of their beds on the ground level, are the most suitable. Similarly heated small span-roofed houses, running from north to south, are the most serviceable for mid-season crops, though ordinary pits and frames, unheated except by fermenting material for the purpose of affording necessary bottom heat, also answer well for these. Strong turfy loam that has been stacked for a few months before being used is the best soil for this fruit. That which we use is excellent, consisting of turves about three inches in depth, cut from an occasionally overflows, and leaves a deposit old pasture by the side of a rivulet that robbed from strong arable land by heavy storms. This, before being made into ridges or hillocks is well broken up and lightly mixed with crushed mortar rubble and soot, and when the ridges are being formed, it is made quite firm by the aid of a brick or mallet; so firm, indeed, is it made that considerable force has to be exercised in cutting holes in it with a trowel for the young plants.

The best way of raising plants is to sow

"CLAY'S, TRIUMPHANT CLAY'S!"

CLAY'S FERTILIZER

THE STANDARD PLANT FOOD

.. IS A ..

PERFECT DIET

FOR ALL PLANTS.

It produces all **FLOWERS, FRUITS, VEGETABLES** and **FOLIAGE** in Profusion, and in the Highest Excellence.

IT KEEPS THE LAWN GREEN AND BRILLIANT.

CLAY'S FERTILIZER

A perfectly safe and useful manure containing the three chief elements of plant foods, viz., nitrogen, potash and phosphoric acid. It is a proprietary specific in general use, adaptable to all forms of soil preparation, and is applied with advantage to plants in pots, and for the production of flowers, fruits and vegetables grown in the open.

(**Cassell's Dictionary of Gardening, p. 217.**)

CLAY'S FERTILIZER

Used in the Royal Gardens, and in Horticultural and Botanical Establishments throughout the world, as well as by leading Professional and Amateur Growers everywhere.

EXHIBITS grown with **CLAY'S FERTILIZER** catch the **JUDGE'S EYE.**

INDISPENSABLE FOR ALL HORTICULTURAL PURPOSES.

CLAY'S FERTILIZER is ready for immediate use. It imparts to the soil forces that vitalize all growing plants and ensure their successful cultivation. It is safe, sure, quick in action and perfectly reliable. It is also a most economical manure.

The Horticultural Wonderbook—"Clay's Successful Gardening."

A comprehensive, informing, up-to-date and complete Guide to Gardening, including directions as to the use of CLAY'S FERTILIZER. 4th Edition (Reprint), 276 pages. Clear Print. Good Paper. Bound in Cloth. It is published by CLAY & SON, STRATFORD, LONDON, E., at NINEPENCE NET, and may be had of Seedsmen, &c.; or direct from the Publishers, post free, on receipt of the above amount.

IN NATU

NEW HARDY PERENNIALS FO

Messrs. Wm. ARTIN

THE MOST UNIQUE COLLECTION OF RARE H

Awarded Four Silver Cups for Hardy Perennials by the Royal Horticultural Society; Four G Premier Gold Medal, Leamington; Premier Gold Medal H

A GLORIOUS NEW LOBELIA.

Gloire de St. Annes.—A greatly improved "Cardinalis," being stronger, and of easy culture in all soils, and not necessarily a lover of damp situations. Its individual flowers are much larger and more orchid-like in form than the type, while the colour has a dazzling brilliancy which is hard to describe, but seen in a mass it presents a wonderful contrast from any of the other Cardinalis varieties. The spikes are long, and retain their flowers for a much longer season than we have ever known any of the other sorts do. The leaves are a dark bronzy green, covered with a woolly substance, which gives the plant great decorative value before flowering. Award of Merit, R.H.S., September 27, 1910. Then shown by Lady Ardilaun, Clontarf, co. Dublin. **5/- each.**

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

Moerheimi Hybrida.—Large flowers of the purest white, with white eye like a white Phlox, and not the slightest shade of creamy, bluish, or greenish, like the so-called "white" Delphiniums, which have been introduced in the last few years, and to which it cannot be compared. It is doubtless the best hardy perennial introduced in the last ten years. Award of Merit, R.H.S., July, 1910. **10/6** each; **£6** doz.

THE FINEST SINGLE SKY BLUE DELPHINIUM.

Capri Hybrida.—Of quite the same growth as "Moerheimi," being a counterpiece of same. It much resembles in colour "Persimmon," but is in every respect an improvement upon this variety. The flowers are larger and the spikes longer, and of a more branching habit. We consider it the best sky blue single Delphinium in commerce. **10/6** each; **£6** doz.

A GREAT ACQUISITION TO THE HERBACEOUS BORDER.

Bidens Dahlioides.—A beautiful plant from the island meadows of Colorado. Rising from a rosette of leaves, each stem produces only one flower, purplish-pink colour. Though the species is hardy, we advise a little protection during winter, by covering with dead bracken fern or long straw manure, removing in early spring. Flowers and foliage both resemble the single Dahlia. **1/6** each; **15/-** doz.

Bidens Dahlioides Albus.—A white form of the above. Perfectly hardy and most free flowering. This was raised in our nurseries, and has been much admired and very much sought after by many leading horticultural experts. **10/6** each.

TWO BEAUTIFUL GOAT'S RUES.

Calega Her Majesty.—A vast improvement on G. Hartlandi. The flowers are much larger, and of a much brighter lilac colour. **1/6** each.

Calega Niobe.—A very fine white variety, flowers large, very free. **1/6** each.

INTERREGNA IRIS.

Quite a new class of Iris. The time of flowering comes between Iris pumila and germanica. This class is a cross between the above two mentioned. They flourish well if planted under ordinary conditions. Flowering season, May and June.

Fritjof.—Upright petals, clear light lavender blue; falls velvety violet.

Halfdan.—Light cream yellow of fine substance; one of the finest Iris, showing up splendidly in full sunshine.

Helge.—Bright lemon yellow, with a pearly reflection; elegant form.

Ingeborg.—Large ivory white flowers, with greeny-yellow net markings; a most beautiful Iris.

Wallhalla.—Uprights light lavender blue, falls velvety wine-red.

Gerda.—Uprights light creamy yellow, falls somewhat darker, shading into golden yellow.

The above collection 2/6 each; 27/6 doz.

GRAND NEW ASTILBES.

Arendsi, Venus.—Spikes of a brilliant rosy purple. A. of M R.H.S., 1910.

Arendsi, Ceres.—Well-branched spikes of flowers, of a brilli rosy lilac colour. Award of Merit, R.H.S., 1908.

Arendsi, Vesta. Light lilac rose, on stout stems of branch habit.

Arendsi, Rose Pearl.—A lovely pink colour, thick pyrami spikes. Award of Merit, R.H.S., 1908.

Arendsi, Salmon Queen.—Very graceful, thin spikes of a light salmon-pink colour. Award of Merit, R.H.S., 191

Arendsi, Juno, brilliant purple rose, pyramidal spikes.

The above collection 2/6 each; 27/6 doz.

Astilbe Grandis.—A new plant, introduced from China. Som what similar in growth to Astilbe Davidi, but rather m vigorous, producing immense panicles of white flow 2 to 2½ft. long. The large leaves are over 2ft. in leng **2/-** each.

Astilbe Thunbergi (rivularis) Moerheimi.—An important provement on Astilbe Thunbergi (rivularis). It is the v finest of this section, with enormous spikes, consisting very small flowers of the purest white. **2/-** each.

BEAUTIFUL SINGLE JAPANESE TREE PÆONY.

Californica.—Very tender flesh colour, shading to white; v free flowering.

Etna.—Silk-like, burning fiery red.

Illinois.—Carmine red, self-coloured flowers, very large.

Missouri.—Tender pink, with cherry red colour in cent fringed flower petals.

New York.—Pure white, with regular ray-like brilliant ch red in centre.

Oregon.—White, with salmon coloured shadings, carmine centre; fine form.

Pennsylvania.—Brilliant salmon red, with silvery reflection.

Wisconsin.—Tender pink, with violet stripe in middle of ea petal.

The above collection, 7/- each; 50/- the Set.

DOUBLE VARIETIES OF TREE PÆONY

Bijou de Chusan.—Pure white, flesh-coloured shadings; l fringed form, dwarf and compact habit. **3/6** each.

Caroline.—Tender salmon colour, shaded cream; sligh fringed; very dense double Saucer form. **3/6** each.

De Bugry.—Exceedingly free flowering, semi-double, sa shaped, pure white, with violet red stripes, with br golden centre. **3/6** each.

Emilia.—Brilliant salmon colour; very dense double flowe **3/6** each.

Jeannie d'Arc.—Tender salmon colour, silvery reflection. **3/6** e

Lactea.—Very fine form, milk-white with cream coloured dwarf. **4/6** each.

Lambertina.—Enormous flowers, white with violet red gr very free. **4/6** each.

La Ville de St. Denis.—Large perfect flowers, white with lil reflection, violet ground. **3/6** each.

Louise Monchelet, very large flowers, silvery salmo **3/6** each.

Madam de Vatry.—Lilac pink, beautifully shaped flowers. **4/6**

Madam Stuart Low.—Brilliant silk-like salmon red with s reflection; semi-double, large flowers. **3/6** each.

Queen Elizabeth. Enormous dense double flowers of a fi rosy red; very conspicuous. **4/6** each.

Regina Belgica.—Salmon pink with flesh-coloured g loose form with feathery tips. **3/6** each.

Remembrance of Browning.—Fringed petals, silky pink, double. **4/6** each.

Roseoleus odorata.—Large flowers, tender salmon pink w flesh-coloured ground. **3/6** each.

Souvenir de Ducher. Ball-shaped flowers, deep reddish with magenta reflection. **3/6** each.

All these Tree Pæonies are sent out in 7in. or 8in. pots

Send for our Catalogue (a book of over 200 pages). This is not merely a price list, but literature which gives the pronuncia

RARE ASTERS (STARWORT).

pinus Nixe.—A charming new variety; thread-like, lilac-coloured petals, which give the flower a fine appearance. **1/6** each; **17/6** doz.

eta-grande speciosus grandiflorus.—One of the best yet raised; quite distinct; large dark blue flowers in great abundance. A. of M., R.H.S. **1/-** each; **9/-** doz.

ompsoni.—The flowers of this variety are beautifully formed, and of an exquisite soft blue colour. **1/-** each; **9/-** doz.

ericus ultramarin.—A brilliant dark blue, flowers forming themselves in large clusters; very free flowering. **1/-** each; **9/-** doz.

Fardell.—Large flowers of a beautiful and quite distinct rose colour with distinct centre; one of, if not the best, variety in cultivation. **1/-** each; **10/6** doz.

Egwin.—Quite a novelty; very densely branched and of bushy habit, producing fine pure pink flowers more than an inch across. A. of M., R.H.S. **1/-** each; **9/-** doz.

RARE SMALL MINIATURE-FLOWERING ASTERS.

nastity.—White, branching habit, very free flowering.

elight—White, changing to pink, with distinct golden centre.

aiety.—Ivory white, branching habit, very effective.

aidenhood.—White, tinted very pale rose.

ovelty.—White, literally covered with flowers.

ingdove.—White, shaded pale mauve.

implicity.—One of the best white varieties.

tar-shower.—White, tinted rose.

enus.—Pale lavender flushed with pink.

The above 1/- each; 7/6 the set.

NEW HARDY PHLOX DECUSSATA.

ll the following are hardy and of robust habit, and decided improvements on the older varieties.

1/- each; 10/- doz. 75/- per 100.

aron van Ledem.—Glistening scarlet blood-red, very attractive.

r. Konigshofer. Brilliant orange-scarlet, dark blood-red eye.

lizabeth Campbell.—Light salmon, changing to pink in the centre; extra.

rau Ant. Buchner.—The finest pure white Phlox; produces flowers of an enormous size and perfect form; A. of M., R.H.S., 1910.

Frühlicht, light pink, early flowering.

C. A. Strohlein, scarlet orange flowers with bright carmine eye; a grand acquisition.

General van Heutsz.—Brilliant salmon red with white centre.

Goliath.—Bright carmine, with dark carmine red centre.

Hanny Pfleiderer.—Cream colour, changing to salmon in the centre, with carmine red.

Hinzpeter.—Dark salmon orange with carmine blood-red eye

Kücken.—Salmon pink with dark eye.

Le Mahdi.—Dark purple violet.

Mad. Paul Dutrie. Soft pink colour suffused with white.

Mrs. John Barker. Dark carmine-pink, self colour, large flower

Reichsgraf von Hochberg.—Brilliant amaranth purple flowers.

Rosenberg. Fiery carmine violet with blood-red eye.

Selma.—Beautiful pink flowers with cherry-red eye.

Souv. de Mad. Paul Leturque. Pink with crimson centre and silvery shade.

SILENE LACINIATA PURPUSI.—Certainly one of the finest introductions of recent years. A very rare species, being found by Mr. Purpus growing on the mountain ranges of Mexico, in a sunny position. A charming rock or border plant, having narrow green leaves, flower stems ranging to a height of about 9 to 12in., producing flowers very freely, of a rich fiery cardinal red, flowers deeply laciniated. This species requires a sunny position, the roots growing deep. Best not disturbed after once planting. A safeguard during winter is a little protection with small branches of dead spruce or shrub; sandy soil is beneficial. A most useful plant for cutting. **1/-** each; **10/6** doz.

ÆTHEOPAPPUS PULCHERRIMUS.—A native of the Caucasus. One of the best plants for cutting purposes as well as the border. Leaves of a greyish colour; produces on slender stems an abundance of flowers from 3in. to 4in. in diameter; colour, tender rose. **2/-** each; **21/-** doz.

ACHILLEA MILLEFOLIA PURPUREA KELWAYI.—A new variety, and quite a novelty, with flowers of a glowing deep carmine red. **1/-** each; **10/6** doz.

PYRETHRUM (DOUBLE) QUEEN MARY.—Quite an acquisition to the double pyrethrums. A very strong grower, with very large double flowers of an exquisite pink colour. Exhibited by us last year for the first time it proved an admiration to all who saw it. **2/-** each; **21/-** doz.

VIOLA GRACILIS.—A lovely Grecian variety. Planted several together in an open position on the rockery or border will soon cover the ground with rich dark-green foliage, covered from spring to autumn with intense violet flowers, and has won admiration wherever shown. Award of Merit, R.H.S., 1908. **6d.** each; **5/-** doz.

CAMPANULA PERSICIFOLIA RIVELIN.—Raised in our Nether Green Nursery. The habit and constitution is better than the well-known Persicifolia Moerheimi. The flowers are semi-double and of a creamy-white colour. They are borne on stout erect stems. What proves this to be a most valuable acquisition is that when the bottommost flowers open the top flowers are still fresh, where with Moerheimi this is not so. **1/6** each; **15/-** doz.

CAMPANULA GLOMERATA SUPERBA.—Erect stems; flowers much deeper in colour than Glomerata. Quite an acquisition to the Campanulas. **1/6** each; **15/-** doz.

GYPSOPHILA PANICULATA FL. PL.—In many cases the doubling process spoils the appearance of the plant, but in this particular case it has altered the appearance entirely, making a new plant quite as characteristic as the old variety, equally as free-blooming, but with flowers snow-white and perfectly double. **1/-** each; **10/6** doz.

PYRETHRUM HYB. ROSEUM NANUM.—A novelty of great beauty with Marguerite-like flowers of a very delicate rosy pink colour. Perfectly hardy, and a most useful plant for the rockery or border; of compact habit, and very free flowering.—This plant will become a great favourite. **1/6** each; **15/-** doz.

VERBASCUM HYBR. MARS (MULLEIN).—Quite a distinct variety of the Mullein, throwing up numerous spikes about 3ft. of a peculiar colour of buff, turning red towards the centre. **1/6** each; **15/-** doz.

CLEMATIS ERECTA FLORE PLENA.—A rare double form of C. erecta, with creamy white flowers on erect stems, 2ft. to 3ft. One of the finest hardy perennials in commerce. **3/6** each; **37/6** doz.

DIANTHUS PLUMARIUS DELICATA.—Novelty of recent introduction, with flowers of exceptionally large size and beautiful form, of a delicate soft pink colour, produced in upright position on stems 12in. to 14in. in height. **9d.** each; **7/6** doz.

DIANTHUS PLUMARIUS GLORIOSA.—One of the best Dianthus recently introduced, with large bright lilac rose flowers on erect stems, 12in. to 14in. **9d.** each; **7/6** doz.

ARTINDALE'S SUPERB STRAIN PRIMULA OBCONICA GIGANTEA GRANDIFLORA.

Seed 1/- to 2/6 per packet.

Plants 3/-, 5/-, 7/6, 10/6, and 15/6 per doz., according to size.

seeds singly in 2½in. or 3in. pots, using fine moist compost, and imbedding the seeds half an inch deep. The pots should be plunged in a hotbed, placed in a pit, with a night temperature of 65 deg., and covered, until the plants appear, with a sheet of glass, at which time they should be placed near the glass upon a shelf, and be kept carefully watered and syringed until they are sufficiently well rooted to be permanently planted out upon hillocks or ridges of compost. If, however, they are intended for fruiting in pots, they should be shifted into those of 5in. diameter, and be allowed to well fill them with roots before being finally potted.

Training the Growth.

Of modes in training, the single cordon is the most simple and popular, and certainly whether the plants are fruited in pots or planted out, it is the best method to adopt for early crops. In carrying it into practice upon trellises, the plants are planted 2ft. apart, and each leading growth is trained up the trellis, and not stopped until it reaches nearly to the top. Enough of the laterals are secured to clothe the trellis without crowding the leaves, and the remainder are rubbed out as soon as visible. The laterals are stopped at one leaf beyond the fruit, and the sub-laterals at one leaf. Three fruits to each plant is a fair crop if fruit of the best quality is required, and in order to have the fruits symmetrical and even, those upon each plant should be set at the same time.

When the cordon principle is adopted for plants in frames, the plants should be grown up a ridge running through the centre of the frames, and each one be stopped as soon as it has made two rough leaves. Two shoots should be trained from each plant, one towards the back and the other to the front of the frame, the subsequent treatment being similar to that advised for trellis trained plants. To dwell upon the extension system of training would demand too much space; by that method, however, very heavy crops can be commanded, though the fruit would not ripen in so short a time as in the case with single cordons.

AN EFFECTIVE GROUPING OF SINGLE ASTERS, AT HAMPTON COURT.

Feeding and Watering.

With reference to feeding, far better results are obtained by a discreet use of fertilisers at the time they are most needed than by making use of rich composts, and there is nothing required in this way until the fruit is set, and the roots are pushing through the hillocks or ridges of soil. At this time a moderate addition of warm compost should be given, and the operation be repeated with a light top-dressing of short manure once the roots again appear on the surface. As a stimulant diluted farmyard liquid manure answers admirably, and may be given each time the plants are watered from the time the fruit is set until it has completed its swelling, but failing this, periodical light top-dressings should be given of an approved artificial compound. During the time the plants are growing and developing their fruit, plentiful supplies of water are necessary, but they must be considerably lessened when the fruit is ripening, though the custom sometimes followed of letting the compost get quite dry at this period should not be followed, as the results of such practice are invariably more or less unsatisfactory.

Ventilation, etc.

Other items of management that require special attention are atmospheric moisture and ventilation. Melons, during the greater part of their season of growth, require a fairly moist atmosphere. For early and late crops this moisture should be promoted by damping available surfaces in the morning and afternoon, while mid-season crops, in addition to this, should be syringed overhead when the house is closed early on fine days. During the flowering and fruit ripening periods, syringing must be discontinued, and drier conditions maintained. Great care must be exercised in cold and windy weather in ventilating the structures, but in hot weather air may be freely admitted. While the plants are in blossom a more or less gentle circulation must be promoted both by night and day, and throughout the ripening period this should be still increased, but in each case warm temperatures must be upheld. Suitable artificial temperatures during the season of growth are 60 to 65 deg. by night and 10 deg. higher by day, the latter being increased by sun heat to 85 deg., and at such times allowed to reach, if accompanied with ample moisture, 95 or even 100 deg. after the house is closed for the day.

Melons are liable to diseases known as canker and gum, but skilfully managed plants are seldom attacked. These evils may be readily promoted by the maintenance of low temperature, and excessively moist atmosphere, or by keeping the compost too wet. Soft luxuriant growth caused by very rich compost is very liable to attack. Quicklime rubbed on the affected parts as soon as the malady appears, and kept dry, is the best remedy.

T. Coomber.

Planting Out Melons.—As soon as the roots have worked through the soil in the second pots, the border should be prepared. If there is sufficient bottom heat from hot-water pipes a strong hotbed is not necessary, but a small quantity of fermenting material is useful at the bottom if the pit is large, and the pipes are low. I always prefer something over the pipes, especially for the early crop, when fire heat is so largely used. Over this place a layer of turf cut from an old pasture, then add good loam well chopped up, with a little lime, soot, and bone-meal. Thoroughly mix the whole together, and then place on the turf, which should be grass side down, and make the whole as firm as possible. After this has become warm, say, in a couple of days, the plants should be set out, taking the greatest care of the roots. Keep the temperature from 65 to 75 degrees, rising to 80 degrees with sunshine.—W. A. C.

MID-SEASON POTATOES.

The production of crops of mid-season potatoes has been dealt with on previous occasions in these pages, and the details are well understood by the majority of professional men, and, indeed, also by many amateurs and enthusiastic cottagers. Nevertheless, there are many who do not fully understand the details essential to success, and are anxious to learn and benefit from others of wider experience, and this must be my excuse for once more writing on this subject. As with everything else, so it is with the culture of potatoes, there is a right and a wrong method of procedure, and it is equally as easy to go on the right lines as on the wrong when once these are understood.

POTATO UP-TO-DATE.
One of the most extensively grown maincrop varieties.

Few crops that are cultivated in the kitchen garden are more affected by soil and situation than those of potatoes, not only in relation to the production of high-class tubers, but their quality also. A fairly light soil which has been well worked and contains a fair amount of lime is that which will produce potatoes at their best. Nevertheless, even on the most uncongenial soils it is possible, with careful management, to produce a good crop of first-rate quality. One of the most important rules to observe is that the site should be an open one, the land well drained, and the soil stirred to a good depth during the autumn or winter months. Fortunately, potatoes may be grown successfully on the same plot of ground for many consecutive years, providing, of course, it is properly treated, and the right kind of food incorporated annually. Soot, lime, and stable manure may be used freely. The lime should be spread broadcast after the trenching is completed, while the long manure should be trenched in, and soot should be applied as a dressing two or three times during the growing season.

Overcrowding is a common mistake. Nothing is gained by putting the sets or arranging the rows too closely together. As to the distance, this, of course, must be determined by the varieties one cultivates, but the rows should not be less than 24 inches apart, and the sets from 20 to 24 inches from each other. The time of planting will depend very largely on the locality and altitude, but my experience goes to prove that one had better be rather late than too early, as when the growths are injured, be it ever so little, by frost, the after-results are not as satisfactory as they should be. I consider the month of April is quite early enough for general planting.

A point that is essential to success is the proper preparation of the sets, and it is of the utmost importance that these are laid out singly, either on shallow trays made for the purpose or some other suitable receptacle, and placed in a cool, fairly light place, where a sturdy growth can be formed. Previous to the time for planting the growths should be reduced to the strongest one, as shown in the accompanying illustration. Good trenches should be opened out with a spade, and when the soil is not suitable, and good shapely tubers such as are herewith illustrated are required, some well-decayed leaf-soil should be placed along the trench, and the sets covered with the same material. As far as possible choose fine weather, when the land is in a workable condition for planting.

Immediately the growths appear above the soil the surface ground should be stirred two or three times with the draw hoe. This will not only keep down weed life but do much to encourage and stimulate the growth. When about three inches in height the earthing-up process should be carried out in a careful and practical manner. The large lumps of soil should be well broken up, and sufficient fine soil drawn up on either side to keep the growth in an upright position as long as possible, and also protect the tubers from becoming green. On poor soils it will be sometimes necessary to apply stimulants in the form of some approved patent potato manure, of which there are now many good kinds on the market.

When extra fine exhibition tubers are required, it will be distinctly advantageous to keep the haulm in an upright position by placing a few stakes at regular intervals on either side of the rows, and stretching one or two lines of stout cord on either side from stake to stake. This will have a tendency to keep the ground in a warmer and drier condition, and do much to ward off attacks of disease.

Potatoes should always be lifted immediately the crop is perfected, and especially so on wet, retentive soils, and those varieties which are prone to disease. Should any tubers be required for exhibition, they should be selected immediately they are lifted and placed in boxes and covered with a fine, dry soil, or sand, to prevent the light and air discolouring them. Then place them in a dark dry place until required, when they should be washed, this being done at the last possible moment.

With such a large range of varieties now before us, it is somewhat difficult, especially to the inexperienced, to know which to grow. As with many other subjects, soil and climate have a material influence upon them, and some that do particularly well in some localities are of little value in others, but among those which I favour are May Queen, Duke of York, and King Edward the VII. for early supplies; whilst Windsor Castle, one of the finest potatoes ever raised, though somewhat liable to disease, is an excellent mid-season variety, good for any purpose, whilst such well-known varieties as Up-to-Date, The Factor, and New Guardian are invaluable maincrop varieties. There are many excellent handsome coloured varieties, but these are generally lacking in quality unless on the more favoured soils.

E. Beckett.

Callicarpa purpurea. — The bright purple berries of this Indian shrub remain fresh and effective for a very long time through the autumn and winter months. The flowers, borne in flattened clusters, are quite insignificant, but they are succeeded by berries, which when ripe are about the size of small peas, and of a bright purple colour. This callicarpa is seen at its best when the long willow-like shoots are allowed to develop to their utmost extent, as then the blossoms are borne nearly throughout their length, and when crowded with berries they form a very notable feature. The plant is of easy propagation and culture, and may, during the summer, be grown in the greenhouse.—W. T.

CALCEOLARIAS AND CINERARIAS.

These two subjects are among the most showy, and also, at least in the case of the latter, among the most easily cultivated of spring-flowering plants. Neither are thought quite so much of as they were some twenty to twenty-five years ago, when a good batch of each was to be found in almost every garden. I well remember one or two old gardeners who thought more of these two kinds of plants than anything else during the whole year. At that time the practice was much in vogue of propagating from cuttings, and especially was this the case with the cinerarias, and I daresay there are a few gardeners who still stick to some of the old varieties, and propagate them in this way. By propagating cinerarias from cuttings you certainly know what you will have, but the plants need very careful attention after flowering to get them to produce really good suckers or cuttings from the base, but if these can be induced to break away freely they invariably grow well, and I must say that the best cinerarias I have ever seen were from cuttings. Some of the old named varieties of cinerarias were very fine indeed, the colours were all that one could wish.

POTATO WINDSOR CASTLE.
A valuable midseason garden variety. Tuber reduced in size.

Cinerarias.

A little advance may have been made in the size of the individual flowers, but what is most lacking is the free branching habit of the old florists' cineraria; the plants in my early gardening days were anything from two feet to three and a-half feet in height, and bushy in proportion, when well grown, but nowadays they are thought a good deal of if they carry from two to three dozen blooms, and the tendency with the larger flowering strains is towards still dwarfer habit, and with the heads of bloom quite out of proportion to the size of the pot they have to be cultivated in.

Fortunately the newer stellata type has largely taken the place of the old varieties, and certainly the plants are very much to be preferred for decorative purposes, and not only are they useful as pot plants, but if not grown too soft they are not at all bad subjects for cut flowers, at least where they can be used without having to be packed and kept out of water for any length of time. As cinerarias come into bloom at a time when there is a superabundance of yellow flowers, in the way of narcissus, etc., the effects that can be produced with some of the pale mauves, blues, and French greys are indeed very pleasing.

The cactus-flowered type of Cineraria stellata is a more recent production. In most instances these are somewhat more compact in habit than the original form, but they are none the less beautiful, and in one or two of the strains that I have grown the colours of the flowers are quite distinct, the shades of red or magenta being particularly bright and pleasing.

PROPERLY SPROUTED TUBERS FOR PLANTING.

The cultivation of cinerarias is almost too well understood to be worth mentioning here, but I may add the cooler the treatment given the better generally will be the results; during the heat of summer or early autumn the plants may with advantage be cultivated out of doors, with, of course, a little protection from heavy rains, and if a suitable position can be found for them, with plenty of light, but away from direct sunshine in the middle of the day, it is surprising how well the plants will grow, producing foliage that is firm and leathery, and totally different to the weak, long-stemmed foliage that is produced by the plants when confined in frames to which very little air is given.

This mode of cultivation applies to the early batches intended for specimen plants, and is hardly applicable to later batches sown in June, or thereabouts.

Occasionally cinerarias are used as bedding plants for the early summer, and I have seen very good beds of them at Hampton Court and in the public gardens, Bournemouth. For this purpose seeds may be sown early in January, and by keeping the plants growing steadily they will make quite nice stuff in 48's or small 32's by the end of May, and will be throwing up their flower heads; providing they are not too much root bound at the time of planting out (quite early in June), they will soon lay hold of the soil, and produce quite a pleasing display over a considerable period.

Calceolarias.

The calceolaria has not changed so much as the cineraria during the last quarter of a century, and certainly has not grown in popularity during that time. It is one of the plants that has had to give way to such subjects as the carnation and the various flowering shrubs and bulbs that may be had in flower at about the same time, April and May, as the calceolaria is at its best.

Unlike the cineraria, it is not one of the easiest of plants to grow successfully, and there are some places where it cannot be made to do well, no matter what attention is given, whilst in others the plants seem to grow quite easily. The nature of the loam in which calceolarias are potted has much to do with success or failure, and if this is not of the right nature or texture no treatment, however careful, will induce them to grow satisfactorily.

The treatment of calceolarias is very similar to that of cinerarias, though it is safer to keep them a few degrees cooler, and certainly they should never be placed where they will get direct sunlight, except, of course, during the very depth of winter.

I prefer to pot calceolarias only moderately firm, using loam, with a little well-decayed manure and plenty of silver sand, though if I could get the loam of a sufficiently friable nature I would leave this out. Great care must be taken at all times with the watering, as once the plants become too wet the leaves turn yellow, and they will need a good deal of coaxing back again to health. Fumigations must be regularly given to ward off attacks of green-fly, a pest which is particularly troublesome to the calceolarias.

But with a good cool greenhouse, and given ordinary care, the calceolaria is a subject well worth growing, and a good batch from a properly selected strain is a fine sight.

Thomas Stevenson.

Primula malacoides.—This is one of the many comparatively new species of primula that we have in recent years received from China. It is a delightful subject for greenhouse decoration during the winter, while, when one remembers the great improvement that has been effected in Primula obconica since its introduction, great possibilities may be hoped for in the case of P. malacoides. This last-named belongs to the same section as P. Forbesi, but it is altogether larger and bolder.—W. T.

WELL GROWN PINK CELERY.

CELERY.

There are few vegetables that can be used for so many culinary purposes as celery, and consequently it is in great demand for at least half of the year. Its cultivation, although simple, is somewhat exacting, and generous treatment must be given to the plant from the seed pan to the time it has finished its growth if satisfactory results are to be secured. Too early sowing is often the forerunner of failure, as the plants may prematurely run to seed, while a poor soil and an insufficient supply of moisture to the roots are only productive of small and stringy produce.

Sowing for the Main Crop.

About the middle of March is the best time for this work, and the seeds should be sown in boxes or pans filled with rich, sandy soil, and placed in a temperature of about 55 deg. Cover the surface of the soil until germination of the seed has taken place, when it can be gradually exposed to the air and light.

The main object is to build up sturdy and vigorous plants, which is only obtained by a moderate temperature, exposure to strong light, and a sufficient amount of air. As soon as the plants have commenced their growth a temperature of about 45 to 50 deg. is high enough—or, in other words, the temperature of a comfortable greenhouse or frame.

Pricking Out.

This is an important item, and should not be overlooked or delayed, but carried out when the plants have attained their first rough leaf and are about an inch high, as they very soon draw up with weakly stems. A cool frame should be selected, in a light position, and filled with about 9in. of rich compost; manure from an old mushroom bed is particularly palatable to the celery plant, and will serve to lighten the soil and act as a useful food; this, with loam and sand added in proportion, will give a suitable rooting medium. The seedlings should be pricked out from 5in. to 6in. apart, and afterwards receive a good watering through a fine-rosed can. If the frame is kept rather close and moist for a few days it will greatly assist to establish the plants and encourage fresh growth. This must not be prolonged, however, and air should be soon admitted freely to the frame on every favourable occasion, until the outside conditions will permit of full exposure. A plentiful supply of water must be given to the young stock through all stages of growth.

Planting Out.

For special culture the single-row system is undoubtedly the best; but for good, medium-sized heads, that will keep well and be very serviceable, the double rows are better and give a heavier yield from a given piece of ground. The trenches, if made out 2ft. wide, will permit of the plants being placed at 1ft. apart from row to row, and allow space on each side to develop and for earthing-up and watering purposes. The bottom of the trench should be prepared by mixing with the soil some rich manure, but not rank and offensive—many failures can be attributed to this mistake. By the end of June or early in July the celery will be ready for removal to the final quarters. Previous to transplanting, a thorough watering should be given, which will help in retaining a good ball of earth to each plant. If this is carried out, and the plants have been treated as advised, they will grow away without a check.

Manurial help at intervals, and dustings of soot over the plants, will give vigour and help to keep the celery maggot at bay. White varieties are generally admitted to be more suitable for early crops; the pink and red ones, being somewhat more hardy, and consequently less liable to injury from frost, and they keep better.

C. Flack.

Rhus typhina lacinata.—To those who plant with an eye to colour in autumn, this handsome form of the common "Stags-horn" sumach will come as a welcome addition. It rivals R. Osbecki or R. sinica in the brilliancy of colour that develops in the leaves in autumn; it equals R. sinica in vigour and freedom of growth; while nothing in the whole genus can approach it in the elegance of the compound leafage. The leaves are from 18in. to 24in. in length, and are divided into segments, which are again broken into endless sub-divisions, which assume a pendulous habit, and present in effect a fern-like texture. Like the type, Rhus typhina laciniata succeeds in any good garden soil in a position open to the sun; it thrives freely where the majority of shrubs would fail, and in soil of less than average quality the autumn colours are conspicuously bright.—L. O. V.

BEDDING PLANTS GROWN AS ANNUALS.

Annuals have a rather bad name with some people, the reason usually assigned being that they are weedy in growth and last but a little while in flower. This is certainly not true as a generalisation, and though it undoubtedly is the case with some, there are many others to which it can only be applied when they are very badly grown. Regarding as annuals for our purpose any plants which flower the same year as they are sown, there are many which make very good subjects for bedding, and, if given the same care as other bedding plants, will give quite as good results, and will, moreover, be of greater interest during the summer. We sometimes see annuals dibbled out like cabbage plants on dry beds in hot weather, but, apart from the deplorable aspect such plants present for a week or two, they can never be really satisfactory to anyone who knows the potentialities of the same subjects under good conditions. Let us deal with a few which fulfil the first requirement of a bedding plant, that is, make an effective display for at least a couple of months during the summer.

Two perennials which are best treated as annuals are

Petunias and Verbenas,

and they may be dealt with together, owing to the similarity in their cultivation. We must raise the plants ourselves if we want the best results, the plants usually sold being forced into flower prematurely for market purposes, to the permanent weakening of their growth. Seed should be sown in February or very early in March, and that very thinly, so that the seedlings may be taken out of the seed pan and put into thumb pots with as little disturbance of the roots as possible. If seed is not sown till late in March the plants will not be fully in bloom till the middle of July. Any plants which begin to run before showing signs of breaking out just above the seed leaves should be discarded, as they will never make strong bushy plants, and pinching is not recommended. The compost used should consist of two-thirds turfy loam and one-third leaf-mould, with a liberal addition of sand. The plants should be well rooted in large sixties before being hardened off at the end of May, but should never be allowed to become starved.

There are various forms of the petunia, and though the bedding varieties may make a better colour display, the large-flowered kinds are both more beautiful as florists' flowers and more interesting. Seed of the best strains is as expensive as that of good pansies, and for the same reason. The taller varieties may either be pegged down or supported by sticks, but verbenas should always be pegged down to some extent. The purple and red varieties of verbena are not good in mixture unless there is a good proportion of whites to tone down the effect. The beds chosen for these two flowers should be in a sunny position, with a good depth of rich soil, when the hotter the summer the finer will be the display of blossom.

A plant of smaller, and more delicate growth is the

Phlox Drummondi.

It needs all the care that is given to the preceding, and unless grown to the best possible advantage is not satisfactory. At its best the clear bright colours produce a brilliant effect, which is surpassed by few other annuals. It is seldom a success on a close retentive soil, but requires a light warm soil and a good summer, and if the soil is rich in lime it suits it all the better. It needs a little assistance in the way of pegging down to regulate the growth and keep the whole bed evenly covered, and it also assists to withstand storms, which sometimes make havoc with a bed of this slender plant. Seed of selected colours is recommended in preference to a mixture, as some poor colours are generally contained in the latter.

One of the choicest annuals for bedding is the

Salpiglossis,

the rich colourings of some of the varieties being almost peculiar to this flower, while the delicate pencillings of the corolla tubes are scarcely less so. Plants should be raised as recommended above, and they are worth growing to the best advantage. There is one great thing to be said against them however, and that is, they are capricious, especially in a wet soil, or one which is unduly rich in manurial residue, and, presumably in the grubs which are usually a feature of such soils. Plants often reach the flowering stage, and even flower for some time, and then die off in a single night. A kindly soil in a good position suits them best, and under such conditions there will rarely by any complaint of loss of plants. In any case, however, some plants should always be kept in large pots ready for emergencies. It is possible to peg them down, but they are more effective when supported by short sticks, the flowers having a better chance of displaying themselves in this way.

Alger Petts

(To be continued.)

AN ATTRACTIVE FLOWER BED AT HAMPTON COURT.
Showing the annual Alyssum maritimum used as a carpeting plant under pink begonias and the silvery-leaved. Leucophytum Browni.

CARROTS ALL THE YEAR ROUND.

The old method of making one large sowing of carrots in April is, or should be, in private gardens, obsolete, for, though carrots keep well, the stored roots are not equal in quality to young ones, and the large coarser roots have a good deal of core. Carrots force well, and this should not be overlooked, but my remarks refer to the ordinary methods of culture, as without glass of any kind there is no difficulty in having medium-sized or small, sweet roots all the year round. Unless grown specially for exhibition purposes I do not think the large long roots so useful as those of the intermediate section, and the shorthorn or stump-rooted.

In many gardens the soil is not at all suitable, and the roots often fail, but for an early supply it well repays the cultivator to make up the soil for the earliest sowing. This does not entail much labour; for instance, with heavy clay soil, it is an easy matter to incorporate a liberal quantity of burnt refuse—wood ashes or old fine mortar rubble, and this makes up a suitable compost to which may be added some quick-acting fertiliser. The bed should, in heavy soil, be raised above the general level, and be in an open sunny position; sow an early variety, such as Early Nantes, Parisian Forcing, Sutton's Inimitable Forcing, Carter's Golden Ball, or Long Forcing. Cover the beds with dry litter or bracken in severe weather, but more harm than good is done if the beds are not uncovered in fine weather. I have alluded here to heavy soil, but no matter what kind of soil, if there has been failures in the past, I would advise the above additions freely, and the omission of animal manure for a time. This sowing should be made in February as soon as the ground is workable, and gives the earliest outdoor supply.

A GOOD TYPE OF SHORTHORN CARROT.

No note would be complete that omitted what is now termed intensive culture, but as regards carrots, that is nothing new. I have grown carrots for early supplies under glass for very many years, and the procedure is well known. The seeds are sown in frames on a warm bed of heating material, either in January or February, and the roots mature in March or April. Carrot seeds are longer germinating than those of most other vegetables. Early carrots require a fine, light, and porous soil, and under glass should be near the light and in frames kept close until the seedlings appear, but ventilate daily afterwards to get rid of moisture and secure a sweet atmosphere. Many years ago, when I lived in the north, I forced large quantities of vegetables. Fresh leaves were collected in the autumn, and made up into huge beds early in the year; on these was put a good depth of rich soil that had in the year previous grown such crops as melons, cucumbers, etc.; the carrots were sown, and the gentle warmth from the leaves enabled us to have nice roots in April. No glass was employed, but thatched hurdles were used for cover at night. When sowing under glass care should be taken not to sow carrots too thickly, and it is a good plan to use the thinnings for first supplies.

What may be termed the first general open-air crop should be sown early in March, on an open border in well-cultivated soil, and if in previous years there has been any difficulty in growing carrots, the land should have been thoroughly dressed with lime, soot, and wood ashes or burnt refuse; indeed, to be successful I have frequently well dressed the land, and, after sowing, covered the seeds with a prepared compost of the above description. These roots will give a late spring and early summer supply. Use such varieties as Carter's Golden Ball or Long Forcing; these, though not large, are very early; to follow, Sutton's Early Gem or Veitch's Scarlet Model are excellent.

A later sowing of what may be termed the summer and early autumn carrots should be made late in April or early in May, and for this sowing the land should be deeply dug and prepared in the winter, so that it is in good condition for varieties of the intermediate section. Varieties with small core and flesh of a close texture should be selected, such as Sutton's Red Intermediate, Favourite, Matchless Scarlet, Model, and London Market—an improved type of the excellent Guerande, and one of the finest flavoured roots we have.

G. WYTHES.

(To be continued.)

LATE PEAS.

To maintain a regular supply of late peas special care should be taken in the selection of a site, as well as in the preparation of the soil. Ground that is now occupied with broccoli will make a first-rate position for the peas, providing it is open, and well away from the maincrop peas to prevent mildew from gaining a hold on the foliage. A fine sturdy growth must be encouraged at all stages.

Trenches well prepared as for celery are undoubtedly necessary for this crop. As the ground becomes vacant proceed by taking out trenches, and well breaking up the bottom: over this place a good layer of decayed manure, and on it the best of the moved soil, adding a dressing of soot and a six-inch pot of superphosphate to the ten-yard run. If the soil is of a heavy nature add a dressing of burnt garden refuse ashes, and well mix the whole together before sowing. The trenches, or rows, should be quite eight feet apart, and the surface be left as rough as possible until the sowing time arrives, as the action of the weather will greatly benefit the soil and crop.

Choose a fine day for sowing, and to secure a fine tilth well work the whole length of the trench with a garden fork to make the soil fine right down to the manure; then rake level, and tread the whole firmly. Draw drills ten inches wide, and sow the seeds evenly, allowing enough to permit a partial thinning when the plants are well above the soil, previous to staking. Cover the seeds with a good inch of the finer soil, and finish off the trench three inches lower than the surrounding level. The trench will then act as a channel for the applications of water. Sow at intervals of twelve days from the end of April to the end of June.

After treatment will consist of staking securely against autumnal winds; mulching as soon as the stakes are put in; and top-dressing with decayed manure on soils of a light nature. Watering must have regular attention during dry weather, using liquid manure and clear water alternately.

If this advice is carried out very little trouble will ensue in the way of mildew and thrips. The latest sown peas are at times too full of growth to complete the crop of pods, and it is then a good plan to pinch out the points of growth; indeed, all peas should be pinched or stopped by the middle of September.

Excellent late varieties are Michaelmas, Autocrat, Sturdy, and Selected Gladstone.

GEO. ELLWOOD.

Old Varieties of Melons.—Mr. Coomber does well to call the attention of readers to some of the old varieties, which are perhaps still unsurpassed in point of flavour. I remember seeing Turner's Scarlet Gem growing at Hooton Hall, in Cheshire, in 1872, and for years afterwards this melon was most difficult to beat in the Liverpool district. For many years I grew it in cold frames with satisfactory results in the summer; indeed, it was just the sort for frame growth, not being too strong, and yet cropping freely. Blenheim Orange superseded the Scarlet Gem, as the newcomer was more showy in appearance and good in flavour. Golden Perfection I grew in 1880, and for many years afterwards. This was a handsome melon, having a deep golden skin, well netted, and of excellent flavour. This also was a good frame melon, although there were many spurious and inferior forms of it, due to careless saving of seed. I had no difficulty in saving seed and maintaining a true stock of any variety, and always found them true to name, even though they were saved for twenty years.—E. M.

SALADING.

When we consider the very important part our salad plants play in the daily necessaries of life one feels ashamed to admit that cultivators generally do not give them the attention and consideration they deserve.

Importance of Salads.

Nothing in the kitchen garden department is more important or more easily produced than the material for fresh and inviting salads. This being so, our aim should be to have the very best perfect selection as regards variety, and at all times quickly grown. Our chief object should be to maintain a regular supply of fresh and even quality, never at any time to have too much of one thing, as towards the end of a large batch of plants they get a little old and tough, losing that crisp freshness so much appreciated when on the table, and leading to complaints, which a little more thought would certainly avoid.

CABBAGE LETTUCE GOLDEN BALL (SUTTON'S).

As grown in the University College Gardens, Reading. This illustration is of much interest as evidence of the great value of the ordinary garden frame in the production of supplies of lettuce early in spring.

Looking Ahead.

To maintain a good supply we must be continually on the alert and have plenty of variety, and being prepared to give change whenever necessary, for no good cultivator cares to be asked for what he cannot produce. In meeting such a demand the help of glass plays the most important part, as a regular even temperature is at all times required to secure the best quality, and also quick results. Without glass in winter our efforts would almost be vain, for we remember the excessive damp and uncertainty of our climate. This is why the French system is being so generally taken up by those who thoroughly understand the real value of good salads. The climate of France makes it very difficult indeed for us to compete with French produce, but experience certainly proves that by adopting French methods we obtain greater satisfaction. Many quote the French as the only experts when writing and speaking on salads, but in every good garden, where glass is freely used, a good supply of salading can be and is regularly kept up.

There is now a much greater variety of subjects used than is generally supposed. Cooked vegetables, cold, such as new and old potatoes, sliced, with beetroot and apple; cauliflower, peas, beans, and Brussels sprouts are used. Fresh crisp celery is also used with beetroot. Fruit is often used too, and there are orange, apple, banana, and grape salads, with suitable oil and vinegar dressings. Then the more common subjects, lettuces, endive, chicory, and dandelion, after being bleached; cress, lamb's lettuce, or corn salad, mustard, cucumbers, tomatoes, and radishes, and sometimes the young leaves of sorrel, seedling onions, chives, garlic, and tarragon are used, according to taste.

Winter and Spring Supplies.

For winter and spring supplies good batches of well-grown endive, chicory, and dandelion should be housed in a frost-proof shelter, so that a portion of each can be placed in the mushroom house or under stages in warm houses to bleach, according to demand. Beautifully crisp lettuce is easily produced in pots or boxes on shelves near the glass in houses where there is a fair amount of heat and moisture, and then placed in the warm pits as weather allows, while in the frames radishes, fresh young potatoes, cresses, etc., can be had. The great secret of salad supply is always looking ahead, having strong sturdy young plants ready to put out as soon as an opportunity occurs and weather conditions allow, selecting all the warmest and most sheltered positions of the garden in the early season, and then using cool and moist borders during the heat of summer, again seeking the help of glass as soon as we see the least sign of cold damp nights. Experience in private gardens has taught me that no definite rule can be laid down as to how these salad plants should be produced. Individual taste and common sense must alone decide, according to circumstances, the best method by which the best supply can be maintained. It has also many times appeared to me that more unity is necessary between the garden and the kitchen to meet the ever-increasing demand for making wholesome salads.

Skill in Preparation.

When salads are not what they should be some people blame the grower; others blame those whose duty it is to prepare the salad, and both may be right; but whatever the material used, no matter how good, it is nothing without the dressing. To have this correct great skill is required in the mixing, as the ingredients used are naturally meant to unite with our salad plants in helping to digest the other food materials which the different salads are eaten with. This, I fear, is too often never thought about. There is a direct purpose for all Nature gives in the way of food, and it is we who spoil the proper result by not knowing why and how to use the material. Everything used in the preparation of good salads, if properly mixed, is meant to appetise and to help digest and control the more nourishing parts of the other foods we eat.

T. J. Powell.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEASONABLE REMARKS.—The lengthening days and increasing power of the sun render it advisable to have the roof blinds put in order. It is a custom with many to remove the canvas blinds as soon as they may be dispensed with in the autumn; this is advisable discretion, because if the blinds are thoroughly dried before being stored their durability is considerably increased. Where this has been done the blinds should be fixed up as soon as possible, so that they may be ready for use at any moment, either for shading purposes or for use on cold nights to diminish the need of artificial heat. We have copings to protect our blinds.

KINDS OF SHADING.—Considerable difference of opinion exists as to the best methods of shading. Many good judges advocate the old canvas shading, while others, who are equally able to advance an opinion, declare in favour of the lath roller blinds or split bamboo shading. The best quality (painted) lath roller blinds have everything to recommend them from the point of durability. They are also a most excellent covering for the houses in exposed positions during the cold periods of winter. It is really remarkable how much protection they afford, frequently making at least five degrees difference in the temperature of the house protected. I must confess that I am not so much in love with them for the summer use. There is always a very sudden drop in the temperature immediately after they have been let down, and this is caused by the air passing between the blinds and the roof, which cools the glass, and causes a lowering of the temperature inside. I merely point this out so that readers who may have adopted lath blinds for shading may keep an eye on the thermometer, and thus be enabled by the discreet use of the ventilation to guard against any possible ill-effects. Another objection raised against lath blinds is that they have a tendency to produce drawn or weakly growths on cypripediums, odontoglossums, etc. There can be no doubt that where shading is heavily done that is to say, when there is no possibility of the sun scorching the plants, these undesirable effects are produced. The majority of orchids will stand, and are benefited by, any amount of strong light, therefore, where shading is used, when it could well be dispensed with, we can only expect weakly growths and unripened pseudo-bulbs.

CLEANING THE GLASS.—It is desirable before fixing the blinds in position to wash down the outside glass, as even under the most favourable conditions a good deal of dirt becomes deposited on the glass, and as it is advisable at this season of the year to afford all the light possible without the risk of scorching or disfiguring the foliage. —H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SEED SOWING.—In this most important work every care should be given to ensure success. In most cases the soil necessary will be composed of loam, leaf-mould, and sand, and passed through a fine sieve. If very dry it should be damped over and turned a few times. Whatever receptacles are used they should be well drained by half-filling them with crocks. After they have been filled with soil ready for sowing they should be well watered through a fine-rosed can and allowed to stand for an hour or so. Avoid sowing thickly, as this only tends to make the seedlings weak. Use fine soil for covering the seeds, bearing in mind that the smallest seeds require very little or no covering of soil whatever. When sown cover the pan with a sheet of glass, and shade it to prevent evaporation. Whenever watering is necessary it must be done most carefully. A temperature of 60 degrees is a very suitable one at this time of the year for raising seedlings intended for the greenhouse, although exceptions must be made, as in the case of the different varieties of schizanthus, verbenas, and stocks, which succeed better under cooler conditions. As soon as the seedlings appear the pan or pot should be stood on a shelf close to the glass, and shaded from hot sunshine. The grower must be guided by his requirements and accommodation in the choice of various plants.

ZONAL PELARGONIUMS.—Cuttings intended for winter flowering should be taken now, inserting them singly in small pots, in preference to placing five or six in a 60-size pot. Put them on a shelf near the glass in a cool house to make certain of a sturdy growth from the start. Be sparing with water until roots are formed, and when the plants are growing freely pinch out the points of growth to make the plants grow bushy. Give attention to plants intended for summer flowering as regards potting, etc.

HERBACEOUS CALCEOLARIAS.—Where specimen plants are desired the best examples should be placed in larger pots. Dry cow manure broken up finely and mixed with the potting material will be found very beneficial. Water very carefully, never allowing the plants to become dry. Keep green-fly in check by frequent light fumigations.

PERPETUAL - FLOWERING CARNATIONS.—The earliest batch of cuttings will now be ready for a shift into 54-sized pots; pot moderately firm, using a compost of good loam with a liberal addition of silver sand, and a little leaf-mould. Continue to pot up cuttings which are newly struck. Plants that have attained a height of four or five inches in thumb pots should have their points pinched out. This must be done before the plants are repotted to allow them to recover from the check. The main batch of cuttings should now be put in.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

CARE OF YOUNG FRUIT TREES.—Many are the mistakes we make in the cultivation of hardy fruits, but none more serious than the neglect of young fruit trees during the first few years. Many still hesitate to use the knife the first year of planting, forgetting that growth always follows pruning; yet through forgetfulness, established and vigorous trees are in many instances annually over-pruned. Considerable care and attention is necessary to ensure good symmetrical, even-balanced fruit trees of all descriptions. All fruit trees should be pruned the first year of planting, not only to balance the check received at the roots, but also to lay a good foundation, as it will be found almost impossible to train a tree into shape after the first few years. A simple rule is, the weaker the growth the severer should be the pruning; and with small stakes here and there, a few ties, and other little attentions through the growing season, trees of good shape are soon obtained.

LIME FOR FRUIT TREES.—Some idea should always be had of the amount of lime contained in the soil in which fruits are grown. Especially is this necessary in the case of stone fruits, and where it is known that the soil is deficient in lime, now is a very good time to apply it. Slaked lime may be distributed over the surface and lightly forked in, or a good application of superphosphate of lime may be given on the surface and allowed to be carried down by the rains. The latter is an excellent manure for all stone fruit. Where other fruit trees have been heavily manured for several years, finer fruit will be obtained by applying slaked or ground lime only for one season; this will liberate all the food that will be required, and it will sweeten and improve the texture of the soil for some years to come.

STRAWBERRIES.—These luscious fruits, coming first as heralds of the many hardy fruits we have at command, are perhaps anticipated with more eagerness than any other kind; therefore every effort should be made to grow them as near perfection as possible. Many gardeners advocate lightly digging the beds in the autumn, and doubtless this method has its advantages on heavy, bad-working soils, but on good loams or light sandy soils it is much safer, and better results may be obtained by trusting only to the hoe. The beds should now be hoed as soon as the state of the ground permits, working in at the same time some approved fertiliser, such as guano, or a thorough dressing of soot and lime. It is quite a general practice to give soot and lime immediately before laying down the straw just before flowering time, and is quite right as a preventive of slugs; but I doubt whether the crop receives any assistance from the application thus late in the season.

ALPINE STRAWBERRIES.—Seeds of these dainty autumn fruits may now be sown thinly in shallow boxes or pans, and if given a brisk temperature and moderate moisture will soon germinate. When the seedlings are large enough to handle they should be pricked off into boxes and kept in a progressive state. Harden them off and plant in their permanent quarters in June. A partially shaded border should be selected, and the soil be well cultivated and manured. Little after-management will be required, excepting picking off the flower spikes, until the middle of July. Alpine strawberries treated as biennials prove much more satisfactory than do those propagated from layers. —J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

EARLY POTATOES.—To permit of the sets being in a proper condition for planting next month have the seed tubers picked over, and the weakly shoots removed, leaving two or three of the strongest and best-placed ones to grow away. Place the tubers in boxes, with a little leaf-mould between them, and, in order to secure green sturdy growth put them in a cool light position, such as a late peach house would afford. The frame-planted potatoes will now require earthing up or top-dressing. About two inches of mould is ample. Select a warm day for the work, as a certain amount of exposure has to take place.

ONIONS.—The sowing forming the main crop may be made at any time from now on whenever the ground is dry enough. Well-manured and deeply stirred positions are necessary for this deeply-rooting plant. A site that has carried celery is good, having been broken up and sweetened by exposure to the air. Before sowing give the ground a dusting of soot, lightly fork it in, and tread firmly. Draw the drills one foot apart. Sow the seeds evenly, and not too thickly, and after covering them leave a firm, even surface to the bed by treading it again and lightly raking. Where the onion maggot is troublesome, and, indeed, in any case, the system of raising the onion crop under glass in boxes has much to recommend it. If it is decided to treat the crop in this way treat as recommended in the last calendar notes, only transfer the young plants direct to the outside bed.

PARSNIPS.—These require a long season of growth, and whenever the weather is suitable make the main sowing. The ground should be rich, and, if possible, trenched to the roots to run easily down. Allow eighteen inches from row to row, and sow a good dusting of wood ashes in the drills with the seed to give vigour to the young plants during their early growth. Hollow Crown and Student are, if saved from good stocks, two of the best varieties. If a quantity of early roots are wanted sow a few drills of the turnip-rooted variety.

ASPARAGUS BEDS.—If lights can be spared and set on a framework over one or two of the main outside beds, and one or two waterings with warm water are given, with a dressing of nitrate of soda every other week, asparagus will be considerably forwarded, and, to some extent, the lifting of plants for forcing inside will be obviated. —C. Flack, Cholmondeley Castle Gardens.

FORMATION OF LAWNS AND GREENS FROM SEED.

It is understood that if a good turf, composed of grasses suitable to the soil and natural conditions, and free from weeds, is obtainable, this is the right thing to employ in the making of new lawns and greens. Such turf, however, is rarely available. The fine, close, grassy turf from the sandy seashore only languishes and dies on our heavy soil inland, and the turf from the heavy medium quickly disappears when placed on soil of a sandy formation. Much might be done to preserve the vigour in the seashore turf by providing a sandy soil for it, and employing kainit as a topdressing several times throughout the year, but this would, in some instances, entail a considerable outlay in finding the sandy soil, and close observation to know when to apply the kainit.

Under these circumstances the simple and much more economical method of sowing down lawns and greens with seeds is now generally adopted in preference to turfing, and the results, when the preparation of the ground and selection and sowing of seeds has been carried out on rational lines, have been everything that could be desired. To secure a good seed-bed the ground should be prepared in autumn or early winter, and left rough on the surface for the frost and air to bring it into fine condition by spring. If the land has been under tillage for some years, and is known to be free from the seeds of bad weeds, the proper levelling and solidifying should be taken in hand after the middle of April. By breaking up the surface with a fork, treading with the heels, and raking, a fine tilth and level surface will be obtained. A roller is useless for solidifying, even although we sometimes see it used, as it does not always find the soft parts. Before sowing, draw a wooden rake lengthways over the ground, about half an inch deep, sow the seed, draw the same rake crossways, and roll. This done, apply a dressing of slaked lime which has been passed through a quarter-inch sieve, at the rate of 4oz. to the square yard. Allow 1lb. of seeds of guaranteed purity, to 30 square yards, and of a mixture to suit soil and situation. I have sometimes seen 1lb. advised for 60 square yards, but this quantity is far too small if a good turf is wanted quickly. Moreover, thin sowings always leave bare spaces for the seeds of weeds to find a home.

In the neighbourhood of woods birds are usually troublesome in picking up the seeds. To prevent depredations of this kind nothing is better than a fairly thick coating of short grass from the mowing machine. It not only prevents the birds from taking the seeds, but it keeps the surface of the soil moist, thereby aiding the germination of the seed, and it eventually decays and feeds the young grasses. Short grass for this purpose should be free from seeds of weeds; otherwise it is likely to prove more harm than good.

In dealing with ground which has not been tilled for a number of years, it is often advisable to fallow it all through the summer, in order to thoroughly clear it of the seeds of obnoxious plants. It should be treated in the same way as that which is to be sown down in April; but, instead of sowing it then, the surface should be left level, and carefully hoed about half an inch deep and raked about once a fortnight until the middle of August. Immediately the soil is moist after this date it should be sown down on the same lines as for April sowing. The end of August is undoubtedly the best period of the year for sowing a lawn. Should climatic conditions be unfavourable for the growth of the young grasses of spring or autumn sowings, a dressing of sulphate of ammonia, at the rate of 1½oz. to the square yard, will prove an excellent stimulant. Once the grasses are in full growth they should be allowed to attain a height of about 4in., and then be cut down with a scythe, and afterwards kept under with the mowing machine. If at any time they show a lack of vitality, an excellent plan of resuscitating lawns will be found in removing the box from the machine and allowing the short grass to fall on the ground. When this method is in practice it is advisable to mow the ground twice weekly, so that the mowings shall be short.

New lawns and greens formed from seeds and maintained in accordance with the foregoing suggestions, cannot fail to give the most satisfactory results under normal conditions, and be pleasant playgrounds to those employing them.

HIBERNIA.

ANTIRRHINUMS AND PENTSTEMONS.

Few garden flowers of their class are so valuable for the large garden as the antirrhinum and pentstemon, while in the small place of the amateur they afford a ready means of rendering his garden bright and well supplied with flowers. For garden decoration, especially in broad masses and lines, they are invaluable, and they supply fine spikes of bloom for cutting for the adornment of the home, although, without a little care, the pentstemon does not retain its freshness long when in a cut state.

Recent Improvements.

Within recent times both flowers have been greatly improved, so that by their aid many brilliant effects can be produced in the garden, and this has been taken advantage of by skilled gardeners, with the result that a considerable number of large gardens owe much of their charm to the use of these flowers in autumn.

Those who, for example, have seen the antirrhinums and pentstemons grown in the princely gardens of Hopetoun House, where broad lines and masses, in contrasting or harmonising colours are employed with the most brilliant effect, will agree that the writer is not overstating the value of these flowers.

Similarly, many a small garden is beautified by these plants, which, in groups or in small beds, are of much effect, and are highly appreciated by all who see them.

The antirrhinum, with its quaintly shaped flowers, presents many features of beauty all its own. The old striped varieties, so long held in the highest esteem by the exhibitor, are practically little cultivated, their place as garden flowers having been taken by self-coloured varieties or those with harmonising or contrasting tints, many of which are exquisite. Seed selection has resulted in the production of varieties, which come to within 10 per cent. of variation in the case of seedlings, and this has practically revolutionised the cultivation of these naturally variable plants, while the colours have been improved, so that the antirrhinum is a much more valuable flower than before.

The pentstemon has been improved also, and the small-flowered named varieties, which were once exhibited with pride as examples of the best of the time, are now relegated to obscurity. The day of the named pentstemon, say for special objects, has greatly waned, and for garden purposes, where mixed varieties will answer, reliance is placed upon seedlings. We are, however, within measurable distance of a race of garden pentstemons which will come almost as true from seeds as the antirrhinums of the present day, and when that time arrives we shall no longer require to trust to cuttings for the maintenance of a stock of certain colours. So far as size and beauty of bloom are concerned the modern pentstemon is a flower far in advance of its predecessor. Greater use, too, is being made of the pretty P. Newberry Gem, said to be P. Hartwegi of botanists, and its sports and seedlings, for the production of new and beautiful varieties.

Propagation by Seeds.

Antirrhinums and pentstemons are easily raised from seeds, and, if sown in spring, both will flower the same autumn, the antirrhinum, in particular, being extremely valuable for autumn bloom if sown at that time. They may also be sown in August for blooming early in the following year, but this necessitates almost as much labour as cuttings, and spring sowing is to be recommended. February and early in March are the best times for this, the seeds being sown under glass in a soil composed of about two parts loam and half a part each of leaf-soil and sand put through a sieve.

The seeds should be sown very thinly, and slightly covered with very fine soil, watering gently afterwards. They can also be sown in a slight hotbed, and in both cases a temperature of about 50 to 60 degrees should be maintained, although one slightly lower will do. In autumn, seeds can be sown in drills in the open in August, wintering the young plants in frames in cold districts.

As soon as the seedlings appear, they should have plenty of air, and when they have made two of their rough, or true leaves, they must be pricked out about three inches apart, and, after growing on, be hardened off to be planted out about fourteen or fifteen inches apart for the tall varieties, ten or twelve inches for the intermediate, and eight or nine inches for the dwarf varieties.

The soil for the antirrhinums may be lighter than for the pentstemons, but they will flourish in the same beds or borders in a good loam, well manured with old manure. A rich soil answers for the pentstemons, and affords finer spikes.

Propagation by Cuttings.

Cuttings of the lower shoots may be made in the end of September or early in October, choosing growths about three or four inches long, preferably with a "heel," and inserting them in frames, in soil composed of two parts loam and one of sand, with a little sand on the surface. The body of soil ought to be three or four inches deep. The cuttings should be inserted with about a third of their length in the soil, and then watered with a fine-rosed watering pan. The lights should then be put on for a few days, and shaded should the weather be bright. After about a week air may be given. In frosty weather the frame should be covered with a mat during the night, but as much air ought to be given as possible at all times.

The young plants may be put out in May, treating them in the same way as those from seeds.

These fine flowers are simply invaluable, and the splendid varieties offered by leading seedsmen under name should be secured, and sown in good time

S. ARNOTT.

CENTAUREAS AND CHRYSANTHEMUMS.

The annual forms of these two flowers make valuable additions to our summer garden display, and are suitable for beds or borders, besides providing an excellent supply of cut bloom for some considerable time. Some of the varieties are especially useful for bouquets, and all adapt themselves wonderfully well to room decoration. A tall vase of the blue cornflower, tastefully arranged with suitable foliage, is very effective, as also is a dinner table furnished with the sweet sultans.

The same culture applies to both groups, and is simple enough for any amateur to undertake, providing proper attention is given to thinning, staking, etc. A common error which often occurs in the culture of annuals is that too much is left to chance; the plants are allowed to remain in the beds too thickly, when, naturally, they cannot develop properly, and the results are poor.

The ground apportioned to their cultivation should be manured and dug early in the year, and the surface allowed to remain in a rough state until it is required for sowing. The first week in March is an excellent time to make the first sowing if the soil is in good working order. Should it be sticky, then it is better to defer the operation for a few days. The best way to sow the seed is in drills, as thinning and cleaning may be then accomplished easily, and a more regular distribution of seed can be made. Beds should be formed four feet wide, with an eighteen-inch alley between each bed. These will hold four rows, one foot apart, and the outside rows will be six inches from the edges of the bed. By adopting this method of cultivation it will be found that all necessary attention may be easily given, the hoe can be used freely, and thinning done without stepping on the beds.

The operations of thinning must be governed by the height and width the various kinds are likely to attain; thus it will be seen that the cornflowers will require more room than the sweet sultans, and so on. Supporting the plants is a perplexing question with many, and the idea should be to provide sufficient support to keep the plants upright, and at the same time afford it in such a manner that no indications of staking can be seen.

Of the annual cornflowers there are three colours, blue, white, and rose; the blue is the most popular colour, and Emperor William is the best representative of it. This is greatly appreciated for vases and bouquets, and its height is three feet. Centaurea depressa is about twelve inches high, and has blue flowers and grey foliage.

The sweet sultans are a little more difficult to grow than the cornflowers, soil of a calcareous nature being necessary to obtain good results. If the soil is deficient in lime a small quantity of old mortar rubble may be worked in with advantage. A great improvement in sweet sultans has taken place during recent years, and there are some grand varieties on the market. The Bride, white; Bridesmaid, lemon; Bridegroom, pink with a paler centre; and Honeymoon, yellow, have larger blooms and longer stems than the older varieties, and are indispensable for decorations. The colours of the older sorts are white, yellow, and purplish-rose, and there is a variety called Margaritæ, with white flowers.

Among annuals chrysanthemums take a foremost place, and are highly prized for cutting, the varieties of carinatum being exceedingly beautiful. Evening Star, yellow, and Morning Star, with creamy-white petals and a yellow centre, are the results of crossing C. carinatum and C. segetum. C. atro-coccineum has dark scarlet petals, with a yellow inner ring and a dark centre. C. Burridgeanum is another beautiful variety. C. segetum, the corn marigold, is well worth growing, if only for cutting, as the rich yellow of the flowers is very effective. The double white and yellow forms of C. coronarium are undoubtedly handsome and valuable for bedding.

As these are all hardy annuals a sowing may be made in the autumn, when an earlier supply of bloom can be obtained than from the spring sowings.

E. C. Pooley.

NETHER GREEN NURSERIES, SHEFFIELD.

Situation has, as everyone knows, much to do with the chances of success in the pursuit of horticulture, and I imagine no one would select as an ideal spot for a garden a plot of ground right within the boundaries of a large manufacturing centre where a cloud of smoke forms a canopy overhead. One can, however, call to mind many places so situated, where enthusiasm, perseverence, and skill contrive to surmount all obstacles, and achieve success that is the more praiseworthy by reason of the difficulties that are confronted and overcome. Messrs. William Artindale and Son may be cited as a noteworthy example. Their Nether Green Nurseries are but a short distance removed from the great works of the manufacturers of cutlery that have made Sheffield famous throughout the world, but as every show goer is well aware, Messrs. Artindale have for some years past held a foremost position among exhibitors of choice hardy flowers, and many silver cups, gold medals, and first prizes have been won during the past few years at the leading shows in the kingdom. The exhibits of the firm are always worthy of inspection, for not only are they attractively arranged, but invariably contain a number of really good things that are of more than ordinary merit, and are in the most robust state of health.

Hardy plantsmen who chance to be in Sheffield with an hour or two to spare, may use the time to advantage by having a look round the Nether Green Nurseries, for they are well furnished with capital stock, and a number of quite new things are to be seen, the head of the firm and the nursery manager being always on the outlook for anything that is worth acquiring. The nursery stands on a hill, and is divided into convenient quarters by beech hedges, which act as screens or wind breaks. Immediately one enters the gateway a boldly constructed rockery comes into view, and here one may obtain a good idea of the extent and variety of the collection of alpine plants, the choicest and most beautiful of dwarf campanulas, primulas, aubrietias, and androsaces being allotted pockets and niches, which they evidently find comfortable. A fine bit of colour was, at the time of my visit, provided by the new and very interesting little plant introduced by Messrs. Artindale to British gardens under the name of Silene laciniata Purpusi. The very first time I saw this plant exhibited it appealed very strongly to me, and further acquaintance has increased my admiration. The plant may be described as equal in brilliancy to the best coloured forms of Delphinium nudicaule or Lychnis fulgens, light and graceful in form, and free flowering as could be wished, and it has proved itself hardy in the Sheffield Nurseries. Another novelty of great interest to be seen here is Bidens dahlioides, which will without doubt become exceedingly popular; it combines in so marked a degree the qualities that go to make a good border flower, and an excellent subject for vase work or table decoration. There is much in the character and appearance of the plant that reminds one of a very slender and gracefully built single dahlia, while it may also be compared with the cosmos, in some varieties of which a similar shade of purplish-pink may be met. A white form has been raised at Nether Green, and it will probably not be long ere other colours are obtained.

It was quite a surprise to me to find that Messrs. Artindale have a fairly large stock of the remarkable new pure white Delphinium Moerheimi hybrida, a plant that has been regarded by all who have seen it in bloom as a most remarkable development among delphiniums, and a valuable addition to the white varieties. It may here be remarked that the general collection of delphiniums is of superb quality, and does Messrs. Artindale much credit. Phloxes, pyrethrums, hollyhocks, and, in fact, all popular border flowers are well grown in thoroughly representative collections. Big beds of seedling astilbes were flowering, and among them I noticed some delightful satiny and rosy shades of pink that will find many admirers. One of the firm's principal lines is a remarkably fine collection of violas, of which immense quantities are grown and despatched to all parts of the country every year. The general collection numbers about 150 varieties, and over half a million plants are propagated annually. As may be imagined, the beds, when in full bloom, are wondrously attractive, and the people of Sheffield come in throngs, in response to a public invitation given by the firm, to see and admire the glorious array of flowers. Another fine feature of the place is a capital herbaceous border some 150 yards long. This is planted in a bold style, so that the plants are seen to great advantage, and the collection is representative of all that is best in the way of border perennials.

There is an extensive frame ground, wherein propagation is carried on, and the immense quantities of young plants in various stages of development afforded ample evidence that the firm's output is very large. Florist flowers, such as dahlias, pentstemons, auriculas, and carnations are all to be seen, and of good quality. A fine smooth-edged rosy-pink carnation, named La Milo, is one of the most vigorous and free-blooming varieties grown here, and it certainly is a splendid flower. In a range of glass houses a magnificent collection of Primula obconica hybrids constitute a great feature. The flowers are large and shapely, and the range of colours is remarkable.

Messrs. Artindale and Son have also a very big market trade, and for this branch of the business cyclamen, Araucaria excelsa, Nephrolepis todeaoides, and other decorative plants are extensively grown. There is, in fact, at Nether Green something to suit all tastes, and at any time of the year the visitor will find much that is of interest. Their business has of late extended so largely that the firm has found it necessary to acquire more land, and with a view to obtaining soil of a different nature a branch nursery was opened at Boston, Lincolnshire. Here, in the wonderfully free and open soil for which the district is well known, a great many choice subjects are growing with a freedom and vigour that prove to demonstration the wisdom in the choice of this locality. Such things as eremurus, crinums, choice gladioli, and montbretias, as well as Darwin tulips, narcissi, and other bulbs are thriving apace. Iris susiana, I. reticulata, tritomas in about forty varieties, and big beds of hepaticas are valuable stocks that are always in demand. The double form of Gypsophila paniculata is grown in thousands, and herbaceous pyrethrums make rare clumps in this beautifully soft soil. Having inspected the two nurseries, and seen the extent of the collection of hardy plants grown, one is not surprised that Messrs. Artindale and Son publish a very full catalogue. This publication is admirably written, and contains copious notes of value to cultivators, and it is worth the while of anyone interested in hardy plants to secure a copy.

Visitor.

NATIONAL SWEET PEA SOCIETY.

GREAT EXHIBITION AT ROYAL HORTICULTURAL HALL, WESTMINSTER, July 11 and 12.

Now is the best time to join the Society. Minimum Annual Subscription, 5s. Schedules on application. "Sweet Pea Annual" free to Members; 2s. post free to non-members.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, February 14.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir J. T. D. Lleweyln, Bart., Drs. J. A. Voelcker and O. Stapf, Messrs. A. D. Michael, J. Fraser, W. Cuthbertson, W. Hales, G. Gordon, H. J. Elwes, E. M. Holmes, A. Worsley, R. Hooper Pearson, C. T. Druery, J. Douglas, R. A. Rolfe, and F. J. Chittenden (hon. secretary).

VARIATION IN WHEAT.—Dr. J. A. Voelcker showed grains of wheat from plants grown in pots to which had been added successively larger quantities of magnesium oxide. The examples varied much in appearance, from a plump, starchy-looking grain, where the proportion between the calcium and magnesium present in the soil was low, to a hard-looking grain, where the proportion of the two elements was nearly equal. The nitrogen content varied in the same way, so that it was much higher where the calcium and magnesium content of the soil approached equality than where the calcium content was much in excess of the magnesium. The crop also increased with the increased content of magnesium, until the ratio between calcium and magnesium reached unity. Dr. Voelcker exhibited these specimens to illustrate the influence of the chemical composition of the soil upon the character of a variety. The experiments were carried out in triplicate, and with three different varieties, with similar results. Mr. Elwes expressed himself in agreement with Dr. Voelcker's views as to the influence of soil and climate in changing the characters of wheat, and said that his own experience led him to the belief that many of the supposed varieties of wheat were not fixed, and, probably, could not be fixed.

HYMENOCALLIS MACROSTEPHANA.—Mr. H. J. Elwes submitted flowers of this plant (figured in "Botanical Magazine," t. 6436). This plant is reputed to be a hybrid between Ismene calathina and Hymenocallis speciosa. Both species are now included in the genus Hymenocallis. Mr. Hoog, of Haarlem, some time ago, repeated the cross, and raised the fine form Hymenocallis Daphne, very similar to, but finer than the original H. macrostephana. (See note by Mr. Worsley in "Gardeners' Chronicle," XXIX. (1901), p. 72.)

GALANTHUS.—Mr. Elwes also showed a fine and vigorous form of galanthus, which Mr. Bowles thought to be of hybrid origin, and took for further examination.

DASYLIRION GLAUCOPHYLLUM. — Mr. Holmes showed portions of the fodder plant, to which attention was drawn by Dr. Voelcker at a recent meeting, and was then thought to be a species of Hechtia. He was now able to identify it as Dasylirion glaucophylium.

ACHILLEA MILLEFOLIUM VAR. RUBRA.—Mr. Fraser showed a dark red form of achillea, similar to that often grown in gardens, which he had found growing wild at Killir, Perthshire.

POLYPODIUM VULGARE VAR.—Mr. C. T. Druery presented a frond of a Polypodium very nearly approaching the beautiful variety cornubiense, which had been found growing near Barnstaple, N. Devon.

ODONTIODA x CRAVENIANA.—Mr. R. A. Rolfe submitted flowers of this hybrid, raised by Messrs. Charlesworth, between Cochlioda Noetzliana ♀ from Ecuador, and Odontoglossum cordatum ♂ from Mexico, and remarked upon the great differences between the parents. The hybrid was bright scarlet, like the Cochlioda.

FASCIATED WALLFLOWER.—Mr. E. Knowldin sent from Dublin a fasciated wallflower, which had been found growing on a wall. The specimen broadened out and forked at the top of the stem.

The Horticultural Club.

ANNUAL DINNER.

On Tuesday, the 14th instant, the annual dinner of this club was held at the Hotel Windsor, under the presidency of Sir John Llewelyn, Bart., subsequent to the annual meeting of the Royal Horticultural Society, of which the club represents the social centre.

Prior, also, to the club dinner, the members had the pleasure of listening to a very favourable report of its financial position and success, and also of its utility, not merely in the direction of hospitality, but also in that of instruction through the lectures which follow the monthly dinners and give rise to discussions of great interest. The tables were, as usual, beautifully decorated with flowers, by the courtesy and kindness of Messrs. Veitch; numerous ladies and other guests were present. A capital entertainment, humorous and musical, was interspersed between the toasts, and in every respect the function was a pronounced success.

Sir John Llewelyn proposed the loyal toasts, first to the King and then to the Queen. Queen Alexandra, and the rest of the Royal Family. The Rev. Joseph Jacob, M.A., proposed in happy terms the toast of "The Royal Horticultural Society," introducing reminiscences of the old and disastrous times and comparing the present position therewith, and attributing with great justice the great bulk of the merit to the assiduous services and devotion of the President, Sir Trevor Lawrence, the indefatigable Secretary the Rev. W. Wilks, and the members of the council generally. Mr. Harry J. Veitch responded in felicitous terms. The President proposed the toast of "The Horticultural Club," which, as he pointed out, intended to heartily fulfil its social functions on the occasion of the forthcoming great International Horticultural Meeting of 1912, by extending warm hospitality to the visitors which it would bring to our shores. Mr. P. Rudolph Barr responded, and the health of the Chairman, Sir John Llewelyn, was proposed by Mr. W. A. Bilney, and received with all the honours. To the toast of "The Visitors," including the ladies, proposed by Mr. George Paul, V.M.H., J.P. Mr. Chiappini, a visitor from South Africa, responded in a capital humorous speech, interspersed with interesting reminiscences of South African life and experiences, and coupled with the assurance that in these days Boer and Briton were working over there hand in hand, and in absolutely equal loyalty to the King and the Empire; while he was happy to say that trade, which he was here to develop and encourage between Britain and South Africa, was increasing by leaps and bounds to still further cement the friendship.

Redhill and Reigate Gardeners' Society.

This society held its first meeting of the session in the Penrhyn Hall, Redhill. Mr. W. P. Bound occupied the chair, and a paper on "The Preparation of Plants for Spring Bedding" was read by Mr. T. Judd, The Gardens, Hatchgate, Reading. In a clear and able way, the lecturer dealt with the various items of his subject, giving numerous valuable hints on the raising and propagation of the many plants used for the purpose. A very interesting discussion followed, and a hearty vote of thanks to the lecturer closed a largely attended meeting.

SUNDIALS.

When of elegant design, and selected with due regard to the positions they are to occupy, sun-dials contribute so materially to the interest and attractions of the garden that it is very gratifying to know that they continue to enjoy a high degree of popularity. Well has Maurice Maeterlinck written, "The sun-dial gives a centre and successive name to scattered and nameless joys," for when judiciously placed it gives added beauty to the scene; and properly fixed it possesses utility as a means of adjusting the clocks of the house. We are reminded of the continually increasing interest in these important garden accessories by the welcome appearance on our table of the comprehensive catalogue of sun-dials published by the well-known makers, Messrs. Francis Barker and Son, Sun-dial House, 12, Clerkenwell Road, London. This publication is something more than a catalogue, for it contains much information on the selection, fixing, and reading of sun-dials. Large numbers of sun-dials in various designs and materials are described and illustrated, as are aneroid barometers, and several pocket compasses. In a leaflet accompanying the catalogue is an illustration of the sun-dial and pedestal that were set up by the late Charles Dickens in his garden at Gadshill Place, near Rochester. Messrs. Barker are the owners of the original pedestal and dial, and the fac-similes are made by them, and sold under the designation of the "Charles Dickens" memorial sun-dial. Thus lovers of Dickens may have at a moderate cost a lasting memorial of him and also a charming garden ornament.

Eckford's
Giant SWEET PEAS

The Finest Blooms

that blossom on the Sweet Pea Plant are grown from Eckford's famous seeds. Eckford, the Sweet Pea Specialist, supplies only seeds that are bound to give good results. Eckford's seeds flower brilliantly, give brighter colours, longer stems, larger flowers, and succeed even in the most difficult soils.

ECKFORD'S are the largest retailers of Sweet Peas in the world, and do not supply the trade.

Villa (B) Collection.
24 Splendid varieties, suitable for exhibition, 50 seeds of each, **5/6,** post free for cash.

Villa (C) Collection.
12 Splendid varieties, suitable for exhibition, 50 seeds of each, **2/9,** post free for cash.

Villa (E) Collection.
12 Extra varieties, suitable for exhibition, 25 seeds of each, **1/6,** post free for cash.

A specially written booklet on Sweet Pea Growing given with every order.

For full list of Special Novelties see next week's issue.

FREE. Send a postcard to-day for large Illustrated and Coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1911, and contains full list of all flower and vegetable seeds.

HENRY ECKFORD, F.R.H.S.
(Dept. 221), Wem, Shropshire.

OBITUARY.

MR. CHARLES FOSTER.

It is with much sorrow and regret that we have to inform our readers of the untimely death of Mr. Charles Foster, one of the most brilliant of our younger horticulturists. After an illness extending over about four months he passed peacefully away at Ladygrove Farm, Sutton Green, near Guildford, on Thursday, February 16, at the age of forty-three.

Mr. Charles Foster was a native of Lincolnshire, and very early in life he gave evidence of his genius for gardening while working under his father. From home he passed to Bloxholme Hall, where, under the tuition of the late Mr. David Lumsden, the solid foundation of practical horticulture was laid. At the early age of twenty-one years he became head gardener at Dowlais House, Glamorgan, and from thence he passed on to take charge of Mr. Morgan S. Williams' gardens at Abergergym, Glyn Neath, South Wales. In 1897 he won the Sutton Jubilee Cup offered for vegetables at the Shrewsbury Show. After a stay at Doddington Hall, Lincolnshire, Mr. Foster went as head gardener to the Earl of Stradbroke, at Henham Hall, Suffolk, where he added considerably to his experience, his skill, and his reputation. In 1903 Mr. Foster was appointed to the charge of the gardens at University College, Reading, and as Horticultural Instructor at that institution. Here he found his opportunity, and under his care the College gardens became a recognised high school of horticulture.

THE LATE MR. CHARLES FOSTER.

In 1907 Mr. Foster was advanced to the position of Assistant Director in Horticulture at the University College, and in 1909 he was made an Associate of the College, in recognition of his excellent work. It was in 1909 that Lord Northcliffe invited Mr. Foster to organise the Times Experimental Station, at Sutton Green, near Guildford. He entered upon his new duties with great enthusiasm, and in a very short time after taking charge he astonished the good people of Guildford and Woking by placing before them supplies of excellent salading, grown under the system of intensive culture he had so satisfactorily established at Reading. He demonstrated that a judicious modification of "French" gardening could be made to pay, and his experiments with farm and garden crops were just beginning to take shape under his hands when in the autumn of 1910 he was taken ill.

While at Reading Mr. Foster conducted extensive trials of sweet peas for the National Sweet Pea Society in a most successful fashion, and he conducted a similar trial at Sutton Green for the society in 1910, and though he was on new ground he achieved a remarkable success. The members of this society subscribed for and presented to him and Mrs. Foster a valuable canteen of table silver, and this was presented to Mrs. Foster on the occasion of the society's annual meeting in December last, Mr. Foster being too unwell to be present. For the National Vegetable Society he also conducted extensive and useful trials at Sutton Green.

Mr. Foster had a seat upon the Royal Horticultural Society's Fruit and Vegetable Committee; he was hon. secretary for Surrey on behalf of the International Horticultural Exhibition of 1912, and he took a keen interest in the British Gardeners' Association, acting as chairman of council in 1907-8.

The funeral took place at Old Woking Cemetery on Monday, February 20, at three o'clock. A service was held in the Parish Church, and among those present were the chief mourners, Mrs. C. Foster and her two sons, and Mr. Horace J. Wright, and Mr. Alex. Dean, V.M.H., representing the National Vegetable Society; Mr. George Gordon, V.M.H., of the GARDENERS' MAGAZINE; Mr. R. Hooper Pearson, of the "Gardeners' Chronicle"; Mr. F. W. Harvey, of "The Garden"; Mr. Chas. H. Curtis, and Mr. Thos. Steverson, representing the National Sweet Pea Society; Messrs. Giles and Macdonald, from Messrs. Sutton and Sons; Messrs. Drew and Mayes, from the University College Gardens, Reading; Mr. Goatley, Lord Northcliffe's head gardener; Mr. J. Weathers and Mr. R. Frogbrook, from the British Gardeners' Association; Mr. E. F. Hawes, from the Royal Botanic Society; Mr. Owen Thomas, of the R.H.S. Fruit and Vegetable Committee; Mr. S. Mortimer, Mr. Thomas Lewis, Mr. Spencer, the station master at Worplesdon; representatives of the Guildford Gardeners' Association. In addition to numerous floral tributes from relatives and personal friends there were those from Lord and Lady Northcliffe, the National Vegetable Society, the British Gardeners' Association, and the National Sweet Pea Society.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912

Scientific and Education Committee.

A Science and Education Committee has been appointed to promote a congress and advance the scientific section of the exhibition. The chairman of this committee is the Hon. A. H. Dyke Acland, P.C., and Mr. F. J. Chittenden will act as hon. secretary. The members include Mr. E. A. Bowles, M.A., chairman of the Royal Horticultural Society's Scientific Committee; Professor William Bateson, F.R.S., Professor Bayley Balfour, F.R.S., Sir Thomas Elliott, K.C.B., Mr. Anderson Graham, Dr. Bretland Farmer, F.R.S., Mr. George Gordon, V.M.H., Mr. H. Rider Haggard, Sir Everard im Thurn, K.C.M.G., Dr. D. Jackson, F.L.S., Dr. F. Keeble, M.A., Mr. Donald MacDonald, Mr. W. Marshall, V.M.H., Mr. Fred W. Moore, M.A., Mr. Spencer Pickering, F.R.S., Lieut.-Colonel D. Prain, C.I.E., F.R.S., Dr. A. B. Rendle, M.A., B.Sc., Mr. A. H. Rivers, Mr. A. G. L. Rogers, Mr. E. S. Salmon, Mr. Arthur W. Sutton, V.M.H., Professor Somerville, Mr. Harry J. Veitch, V.M.H., Professor S. H. Vines, D.Sc., F.R.S., and the Rev. W. Wilks, M.A. Whilst, therefore, this great exhibition will be one of the chief spectacular attractions of the London season of 1912, the unique opportunities afforded by the presence of experts from every country will be utilised to the fullest extent for the advancement of horticultural science.

PRESENTATION CUPS.

We are informed by the hon. press secretary, Mr. R. Hooper Pearson, that already several valuable cups have been presented for competition at the Royal International Horticultural Exhibition to be held next May at Chelsea. Among the donors are: The Treasurer (Sir Jeremiah Colman, Bart., V.M.H.), the Chairman of the Executive Committee (Mr. J. Gurney Fowler), the Worshipful Company of Fruiterers, the Worshipful Company of Gardeners, the proprietors of the "Gardeners' Chronicle, Messrs. Sander and Sons, St. Albans; Messrs. J. Charlesworth and Co., Haywards Heath; Messrs. Dobbie and Co., Edinburgh; Messrs. Barr and Sons, Covent Garden; and Messrs. George Bunyard and Co., Maidstone. Others wishing to contribute cups should communicate with the hon. secretary, Mr. Edward White, 7, Victoria Street, Westminster; or Mr. Harry J. Veitch, chairman of the Schedule Committee.

TRADE NOTES.

Messrs. Wm. Cooper and Nephews, of Berkhamsted, the proprietors of Cooper's Sheep Dipping Powder, have had the honour of receiving a warrant of appointment as purveyors of Sheep Dip to his Majesty the King. Messrs. Cooper held a similar appointment to King Edward VII.

Messrs. Dickson, Brown, and Tait, Corporation Street, Manchester, have been appointed seedsmen to his Majesty King George V. This firm held a similar honour for many years, during the reigns of her late Majesty Queen Victoria and his Majesty King Edward VII.

Send for Booklet "Garden Enemies" — and Special Syringe List from —

ROBINSON BROS., LTD., I, WEST BROMWICH.

It is for your benefit

that Clift's Manurial Insecticide is made under the control of highly trained Chemists to assure its unequalled efficiency as a Soil Pest Destroyer, its harmlessness to Plants, and its unvarying standard of quality.

We make all the ingredients ourselves, and know the power of them exactly. From first to last, a permanently retained staff of experienced analytical chemists supervise the manufacture.

In consequence Clift's Manurial Insecticide is the strongest and safest of all soil fumigants, and every pound of powder is dependable.

It is immediately effective, and destroys Wireworms, Leatherjackets, Millipedes, Centipedes, Ants, Slugs, Woodlice, etc., and, in fact, every injurious soil insect.

Use it now. The cost is small—the time and trouble of applying it infinitesimal. The results—clean appetising vegetable crops, and an abundance of fragrant bloom on vigorous, thriving plants.

1 ton, **£9 0 0**	1 cwt., **10/6**	28 lbs., **4/3**

ANSWERS TO CORRESPONDENTS.

AWARDS TO DAFFODILS.—M. E. J., Cambridge: In the case of ordinary florists' flowers submitted for an award from the Royal Horticultural Society, "three blooms at least must be sent; and in all practicable cases the growing plant will also be required; but cut specimens, if sufficient, will be admissible when the habit of the plant is well known." The R.H.S. Daffodil Committee has, however, a different regulation, which is that, "No Award of Merit will be made to daffodils unless at least eight blooms are shown, and no First Class Certificate unless there are twelve blooms." We believe this regulation was made because, some years ago, flowers of new daffodils secured awards under the Floral Committee's "three bloom" rule, but the varieties were not seen again, or eventually proved so weakly constitutioned that the award was useless. The larger number of daffodil flowers now demanded ensures the culture of a variety for a longer period than if three flowers only were essential.

BOOK ON IVIES.—L. C. J., Malvern: So far as we can remember the only book dealing solely with the ivy and its varieties is "The Ivy—A Monograph," by the late Mr. Shirley Hibberd. It contains numerous coloured and other illustrations, and describes the numerous garden ivies. The price is 5s., post free, from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

GRUBS IN SOIL.—F. M., Coventry: After examining the sample of soil very carefully for some time we could find no trace of grubs of any kind; there was not even a tiny millepede. If you pick out a few grubs from the soil in which the carnations are growing, and send them to us enclosed in a small tin matchbox, we will do our best to identify them, and advise you what to do to get rid of them. If they are the whitish fat grubs of an otiorhynchus, or vine weevil, you will have some difficulty in getting rid of them.

THE LINDLEY LIBRARY AND THE ROYAL HORTICULTURAL SOCIETY.—F. E., Loughborough: We are not aware that there has ever been a "squabble" in connection with the Lindley Library that is housed at the Royal Horticultural Hall. Mr. Elwes, and others who wish to see the Royal Horticultural Society in possession of a library worthy of its high position, have urged the council at each annual meeting, year after year, to expend money on the purchase of old, as well as new books. Under the original terms of the Lindley Library Trust, the trustees might at any time have removed the books from the custody of the society. As long as that state of uncertainty existed the council never felt justified in spending more than a small sum annually out of the funds of the society, in developing this valuable collection of horticultural and botanical works. The trust deed has at last been modified—the existing trustees have retired, and the Royal Horticultural Society, acting by and through its council, has now been made sole trustee, with the determining voice as to where the books shall be kept. The library having thus become permanently attached to the society, the council have no longer any hesitation in spending the society's funds on the purchase of valuable books; and a committee, consisting of Messrs. H. J. Veitch (chairman), E. A. Bowles, C. Harman Payne, J. T. Bennett-Poe, and Dr. Daydon Jackson, with the treasurer and secretary, ex-officio, has been appointed, to advise and assist the council in the work of strengthening the library.

CHICORY CULTURE.—D. W. W., Brecon: The ground on which chicory is to be grown should be deeply worked and well manured some time before the seeds have to be sown. Sowings should be made during April or May, and it is a good plan to make two or three sowings rather than depend on one large sowing. Draw shallow drills one foot apart, sow thinly and eventually thin out the seedlings to nine inches apart. Beyond frequent hoeings hardly any further attention will be necessary, until in late autumn the roots are lifted for forcing.

DIVIDING HERBACEOUS PHLOXES.—A. L. M., Caterham: The work of dividing and transplanting herbaceous phloxes may be performed at the first suitable opportunity. Weather permitting, when the young growths just appear above the soil surface lift the old stools and break them up into portions consisting of from three to six healthy shoots. These divisions should be from the outer part of the old plant, and the central, hard, and starved portion should be discarded. Everything should be ready so that the divisions may be planted straight away, and then there will be no check. If goodly masses of one colour are needed then place three portions (or young plants) of a variety, two feet apart, in the form of a triangle. With due care in watering, hoeing, and staking, excellent results may be secured this season from the transplanted stock.

GLORIOSA SUPERBA.—M. O., Kington: The present is a very good time at which to pot up the tubers of that fine old stove climber—Gloriosa superba. The size of pot used must depend on the size of the tuber, but for big tubers pots twelve or fifteen inches in diameter will serve. These must be well drained. A very suitable compost consists of two parts rich loam, one part half-decayed leaf-mould, with a little dried sifted manure and a goodly addition of silver sand.

NAMES OF PLANTS.

S. A., West Bromwich.—1, Cœlogyne cristata; 2, Dendrobium nobile.

W. A., Oldham.—1, Phlebodium aureum; 2, Pteris tremula; 3, a form of Polypodium vulgare.

G. T. S., Sidmouth.—1, Drimys Winteri; 2, Leucophyton Browni; 3, Cattleya Trianæ—a very poor variety.

C. B. G., Cambridge.—1, Saintpaulia ionantha; 2, Primula Kewensis; 3, Sparmannia africana; 4, Aloe verrucosa.

A USEFUL SWEET PEA BOOK

In view of the great extension of the interest that is being taken in sweet peas, and the consequent increase in the demand for trustworthy information on the selection of varieties, and the details of successful cultivation, we feel that we shall be doing our readers a service by directing special attention to the assistance "Sweet Peas and their Cultivation" is so well able to render those who are engaged in the culture of these fragrant flowers. The book is not new, as evidenced by the fact that it has reached its second edition; but the publication of the second edition is so recent that it is practically a new book; and the large and continuous demand is evidence that it is fully accomplishing its mission. In the seventeen chapters into which the book is divided, the history and development of sweet peas, the selection of varieties, soil preparation, seeds and seed sowing, propagation by cuttings, staking and tying, growth in pots and tubs, raising new varieties, exhibiting flowers, and fungoid diseases and insect pests are fully dealt with. The price of "Sweet Peas and their Cultivation" is 1s. 6d. net, and may be and L. Collingridge, 148 and 149, Aldersgate obtained from the publishers, Messrs. W. H. Street, London, E.C., post free, 1s. 8d.

FORTHCOMING ENGAGEMENTS.

SATURDAY, February 25.—British Gardeners' Association (London Branch): Bohemian Concert, Carr's Restaurant, Strand, W.C., 7.30 p.m.

TUESDAY, February 28.—Royal Horticultural Society. Committees meet at 12 o'clock; Lecture at 3 p.m. on "Recent Works in Seed Selection," by Mr. G. F. Scott-Elliott, M.A. (Masters' Lecturer for 1911); Scientific Committee at 4 o'clock. National Hardy Plant Society.—Meeting of the Executive Committee, 5 p.m., and Meeting of Council, 6 p.m., at Hotel Windsor, Westminster, S.W.

FRIDAY, March 3.—Gardeners' Royal Benevolent Institution (Liverpool Auxiliary) Concert, at Bear's Paw, Liverpool.

GREENHOUSE PAINTING and GLAZING. "Vitrolite," superior to White Lead Paint, 9s. per gall. "Plastine" supersedes Putty, 16s. per cwt. Particulars from W. CARSON and SONS, Grove Works, Battersea. Agents throughout the country.

TWO EXCELLENT POTATOES.

WEBBS' NEW FIRST CROP (FIRST EARLY).—Awarded the maximum number of 3 marks by the National Vegetable Society, 1910. Pebble-shaped, flesh white, and of excellent cooking quality, 4s. per peck; 14s. per bushel.

WEBBS' NEW GUARDIAN (SECOND EARLY).—3s. 6d. per peck; 12s. per bushel.
Mr. E. BECKETT, Head Gardener to the Hon. Vicary Gibbs, writes: "Webbs' New Guardian is unquestionably one of the finest Potatoes yet raised. It proved to be the heaviest cropper by far, and best disease-resister we grew; its keeping qualities are all that can be desired."

SUTTON'S EXHIBITION LONGPOD BROAD BEAN.—Mr. J. A. HALL, Gardener to R. H. C. Harrison, Esq., J.P., writes: "Sutton's Exhibition Longpod Bean is a strong grower, and very prolific. Pods about a foot long, and the beans are delicious when cooked."
Per pint, 1s. 6d.; quart, 2s. 6d.; post free.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

THE KELWAY "ARTISTIC" BORDER makes a garden of enduring beauty, from early spring to late autumn, with a minimum of cultivation, and without the trouble of constant digging or bedding-out. The plants composing the border are from strong country-grown stocks, which will flourish under almost all conditions. Send dimensions of space to be filled, or write for Kelway's "Gardens of Delight" (6d.). The cost of the "Artistic" Border is 15s., or 25s. for 10 square yards.

KELWAY and SON, the Royal Horticulturists, LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY DELPHINIUMS which have been improved almost out of recognition in the past twenty years. They produce plants ranging in height from four to eight feet, exceptionally hardy, and with a rich profusion of choice blooms in all the shades of blue.
Choice named varieties: 24s., 34s., and 56s. a dozen.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

EVERY Gardener, amateur or professional, will find a large amount of useful information in the new edition of Kelway's "Manual of Horticulture"—the varieties, prices and culture of all sorts of garden plants, particularly those wonderful improvements raised in the Kelway Nurseries at Langport. A copy will be sent post free for 2s., which will be credited on the first order.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY'S GAILLARDIAS, the rich golden blooms of which are noted for their powers of endurance during the driest season, and as cut flowers retain their freshness and beauty long after they have been gathered. They flourish with a minimum of attention, and give abundant bloom the same year that they are planted. Choice named collections, 12s. and 18s. a dozen.

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

FIDLER'S NEW ILLUSTRATED CATALOGUE OF CHOICE GARDEN SEEDS will be sent, post free, to any address on receipt of postcard. Write at once for a copy. It may help you to save 50% on your seed bill this season. FIDLER and SONS, Royal Berks Seed Stores, Reading.

NEW APPLE, "HOUNSLOW WONDER."

Having grown and marketed this apple in quantity we can confidently recommend it as a most profitable kind for market purposes.

"Almost everyone recognises the great value of 'DUMELOW'S SEEDLING' or 'WELLINGTON' as a cooking apple; anything approaching it is well worthy of consideration. For this reason we call attention to this fine apple, which we have thoroughly proved for several years. It is a seedling from 'WELLINGTON,' and makes fine prolific trees on the Paradise stock. The fruits are large and handsome, roundish, and flattened. The skin is pale yellow, highly coloured on the sunny side, the eye is large and open, while the stalk is set in a shallow cavity. We consider it a first-rate eating apple at Christmas time, rather than a cooker. Its whitish flesh is very juicy, and possesses a rich, aromatic flavour."

Maiden Trees on Paradise Stock, **2 6** each; **24/-** per dozen.
Two-year-old Bushes on Paradise, **3/6** each; **36/-** per dozen.

NOTE OF THE WEEK.

Herbaria.

Herbaria, in the form of collections of dried specimens of foliage, flowers, etc., are essential to the botanist, and are of immense value for the classification and identification of the innumerable plants which constitute the flora of the world generally. By their means, the species of widely divergent habitats may be brought together and compared, and it is in this way that links are found which practically prove a connection, direct or indirect, between all plants in existence, species merging into species and genera into genera, as, by means of the herbarium, the border forms, as they may be termed, are brought together for comparison. To the true plant lover the herbarium specimen is a very poor substitute for the living plant. In going through the collection of dead and withered remains he feels like a student of mankind who visits a catacomb, and, amid the skulls and dead bones, misses the warm breath of life and the myriad human impulses and differences which animate the crowd without. In the garden, the field, the forest, etc., etc., on the other hand, every leaf and every blosson is athrill with vital energy, and replete with its own special beauty uncrushed and undistorted, a living entity in short, instead of a mummy. Everything however, depends upon the point of view and the purpose involved. In these days of botanical study the professor and the student utilise the herbarium hand in hand with the wonderful living collections at Kew, and in the many other botanical gardens scattered about the world; and in the great herbaria kept in conjunction with such institutions innumerable plants find a place which, for many reasons, climatal and otherwise, it would be impracticable to have in the living form. Hence the one is a sort of complement to the other. There is, however, a side to the herbarium question which is not, to the lover of living plants, a very pleasant one, viz., the collection of rare plants for herbarium purposes only, which, of course, means the death of every complete plant so collected, and, when carried to excess, is only too apt to exterminate the rare plants as effectually as any vandal could do it for merely commercial reasons. In point of fact the commercially-minded vandal is less drastic than the herbarium maker, since, if he sells the plant, there is at any rate a chance of the purchaser cultivating it, while once the poor thing is pasted into the herbarium it is absolutely dead beyond recall. We have seen hosts of specimens of rare plants, rare perhaps in certain districts, or, it may even be rare in the general sense, but in order to have a perfect specimen the roots are lifted entire, and probably the district is given, so that others may confirm the locality of the find and integrity of the record, a process which in time is bound to eliminate the plant altogether. It is within our knowledge that a certain very rare fern was discovered as a solitary plant in late spring; the finder, a herbarium maniac, cut off all the fronds as herbarium prizes. Not content with this, having marked the place, he got a friend to visit the spot in the autumn in order to deprive the unhappy plant of the few fronds it had sent up to replace those removed. Beyond very reasonable doubt that plant was killed, for no fern would be likely to survive such treatment twice in succession. Another case was that of a rare fern reported at a certain spot in Scotland. An immediate visit failed to find a trace of it, and a local resident explained its absence by the fact that a professor of botany and a body of students had visited the habitat shortly before, the presumption being another haul, and another massacre in the interest (?) of science. Whether this really happened or not we cannot say, but undoubtedly there is good reason for deprecating the too heedless sacrifice of plant material for herbarium purposes without taking some steps to secure the survival of the plants concerned by only partial removal of foliage or roots, while, in the case of cultivable plants, the collection of seed or spores for propagative purposes, instead of the plants themselves, would often, with a small sacrifice of time, provide ample material for the purpose in view, while assisting in perpetuating, instead of exterminating.

MR. W. J. GODFREY.

Mr. W. J. Godfrey of The Nurseries, Exmouth, Devon, a well-known raiser and exhibitor of chrysanthemums, began business seriously about thirty years ago. His first introduction, however, was a potato, not a chrysanthemum, and this he named Queen of the Earlies, but it was afterwards sent out in America, and Mr. Godfrey considers it is the variety now known as Puritan. For some years before this Mr. Godfrey had made extensive trials of potatoes at a time when most of the new varieties came from America. The Godfrey calla, or arum, extensively grown at home, in America, and on the Continent, was raised at the Exmouth Nurseries; it has been in general cultivation now for about fifteen years, and is a great favourite, but when it was exhibited before the Royal Horticultural Society its claims to merit were not officially recognised. Mr. Godfrey has long taken an interest in both border and tree carnations, and in our issue of August 16, 1902, he said, "In ten year's time we shall have seen a marvellous change in the extent of winter carnation culture." His prophesy has come true in less than ten years, and, as one of the original members of the Perpetual-flowering Carnation Society, he worked to bring it true. Mr. Godfrey's first introduction among chrysanthemums was Beauty of Exmouth, sent out in 1892, and this was followed two years later by Queen of the Earlies, a variety that long held a high position among market growers. Bessie Godfrey, Sensation, Godfrey's Bride, Mafeking Hero, Mrs. W. J. Bryce, Godfrey's Eclipse, G. T. Evans, are a few of the Exmouth varieties that have brought fame and business to Mr. Godfrey. In other directions this burly Devonian nurseryman has accomplished excellent work, and visitors to the Temple Show in recent years will remember the beautiful huge poppies in a great variety of art colours raised and shown by him, and will hardly need to be reminded that he has also paid more attention than any other modern raiser to the improvement of show and regal pelargoniums. In short, Mr. Godfrey occupies a very high position as a raiser, florist, and cultivator.

Purchase of One Tree Hill.—Some three miles to the south of Sevenoaks is One Tree Hill, the culminating point of a wide area of weald country, which is crowned by an ancient and solitary beech, and is said to be a landmark visible to vessels in the Channel, some fifty miles distant. Whether this be the case or not, the slope is gradual from the north, but on the south the ground, from within a very short distance of the beech, falls precipitously to the wide expanse of weald below, white rocks jutting out between the oaks and yews that cling to the hillside. From the summit the view is remarkable alike for its extent and beauty, as will be readily understood when it is stated that it ranges from the heights of Ashdown Forest and Crowborough, in the west, to the chalk hills of Dover and Folkestone. A short time since Lord Derby put into the market his estates between Sevenoaks and Tonbridge, and when it was found that One Tree Hill was thus placed within reach of the public it was felt that an effort should be made to secure it for public use. Negotiations were entered into with Lord Derby, and, as the result, his Lordship offered to sell to the National Trust the hill and several adjoining fields with an aggregate area of thirty acres, for £1,000. The offer was at once accepted, and two members of the Trust generously contributed the whole amount, and thus preserve One Tree Hill as a memorial to a near relative.

National Amateur Gardeners' Association.—The programme for the current year of this enterprising society has been issued, and this affords evidence that the members will, as in previous years, have ample opportunities for entering into friendly competition with each other, and also for meeting together for the discussion of matters of interest to amateur gardeners. The meetings of the society are held on the first Tuesday in each month, with the exception of July and December, and classes are provided for the more important of the flowers that are then at their best. On July 15 the exhibition will be held in the gardens of the Royal Botanic Society, Regent's Park, and a comprehensive schedule, with liberal prizes, has been prepared. Roses, sweet peas, and violas have numerous classes provided for them, and should form highly attractive features. The hon. secretary is Mr. F. A. Poulton, Rosemount, Park Road, New Barnet.

North of England Horticultural Society.—The council of this society have had two meetings and are able to announce that it is receiving hearty support. They have arranged to hold a monthly meeting and show on every third Wednesday in the month, the dates being March 22, April 19, May 17, June 7, July 19, August 15 (perhaps at Harrogate), September 20, October 18, November 15, and December 20. The council and committees will meet on these dates, and a lecture will be given at each meeting. The council are willing to hold a show in co-operation with local societies anywhere in the North, and they are also prepared to send deputations to award their diplomas for new plants, fruits, flowers, etc., and award cups, if required. As regards educational work, the society is receiving the hearty co-operation of the staff of Leeds University, and it is hoped, also, to receive the full support of the authorities of the Armstrong College of Science, Newcastle-on-Tyne.

Horticulture at Turin.—In connection with the forthcoming International exhibition at Turin, a permanent Horticultural Exhibition will be held from April to November, 1911, and also three temporary shows. The permanent section forms part of the General Exhibition, and includes matters relating to the cultivation of fruits, vegetables, and flowers; garden implements and tools; and teaching and appliances for teaching. The three temporary flower and fruit shows will be held as follows: Spring show, May 15 to 25; summer show, September 16 to 24; and the autumn show, October 25 to November 4. Copies of the regulations and schedules relating to these shows may be obtained from the secretary to the Hortitural Committee, 21, St. James's Square, S.W.

The Home of Cymbidium Tracyanum.—The mystery that for nearly a score of years has surrounded Cymbidium Tracyanum has now been practically solved, as, according to the "Orchid Review," plants have been sent to Trinity College, Dublin, by Dr. Alexander Kerr, who collected them at Chengmai, Siam, therefore Mr. Rolfe assumes with good reason that the home of C. Tracyanum is in the Southern Shan States, part of which are in Burmah and part in Siam. The orchid is evidently found in company with C. Lowianum, as the original plant obtained by the late Mr. H. A. Tracy was purchased as C. Lowianum. When it flowered it was purchased for 75 guineas for the Dell collection. Mr. Prewett, of Hammersmith, flowered another plant in 1895, while yet another appeared in the autumn of 1895, in Mr. Woodhead's collection at Liverpool. The Messrs. Sander and Sons, and Mr. Steel, of Selkirk, flowered the same species or natural hybrid somewhere about the same time, and the very generally expressed opinion has always been that C. Tracyanum is a natural hybrid between C. grandiflorum and C. giganteum. A later acquisition, C. I'Ansoni, also imported with C. Lowianum, is regarded as a hybrid between the last-named and C. Tracyanum, but these questions of parentage have yet to be cleared up by our hybridists.

The Small Holdings Movement.—The remarkable development of the small holdings movement in recent years has led legislators interested in the land problem to consider in what manner the Act of 1892 may be amended to meet the altered circumstances of modern times. Mr. Jesse Collings has within the last few days introduced a Bill, which is influentially backed, to afford further facilities for the creation of small holdings. Chief among its provisions is the power given to County Councils to advance to the purchaser of a small holding any money not exceeding nine-tenths of the cost for the purpose of creating on the small holding a dwelling house and such other buildings, or making such an adaptation of existing buildings as, in their opinion, are desirable for the due occupation of the small holding, provided that the requisite plans and specifications are previously submitted to, and approved by, the County Councils. This applies to the equipping of the small holding when acquired. The Bill, however, deals much more liberally with the man who wants a small holding. It is proposed to substitute for Sub-section 3 of Section VI. of the Act of 1892 the following: "A County Council may advance to any person purchasing a small holding in pursuance of this Act the whole, or any less part, of the price of such holding."

Annual Meeting of the U.H.B.P.S.—The annual meeting of that very excellent institution, the United Horticultural Benefit and Provident Society, will be held at the Royal Horticultural Hall at eight o'clock on Monday, March 13, when the chairman of committee, Mr. Chas. H. Curtis, will preside. We understand that the society has had a considerable accession of members during the past year, and has added no less that £3,000 to its investments. It is hoped that a large number of members will attend, and show their appreciation of the services so ably rendered by the committee, officers, and trustees.

Gardeners' Dinner at Dumfries.—On the evening of February 23 the Southern Counties (Scotland) Gardeners held a dinner in the King's Arms Hotel, Dumfries. This function is intended to be the first of a series of such events, whose object is to bring the local members of the craft into touch with each other, and the success of the first dinner justifies the hope that this purpose will be served. There was a very large attendance of members of the seed and nursery trade, as well as of gardeners, from various parts of the counties included in the scope of the reunion. The chair was occupied by Mr. T. Young, of the Crichton Royal Institution Gardens, who made a short, but able, speech, in which he stated the objects of the meeting, which, in addition to the social element, included the consideration of a proposal to form a Gardeners' Mutual Improvement Association. A number of toasts were proposed, and responded to. A discussion took place on the suggested formation of a society, and it was arranged to hold a meeting on March 4, when a paper will be read by Mr. Hunter, of Messrs. James Service and Sons. The dinner was arranged for by a committee, with Mr. Taylor, Brocklehirst, as secretary.

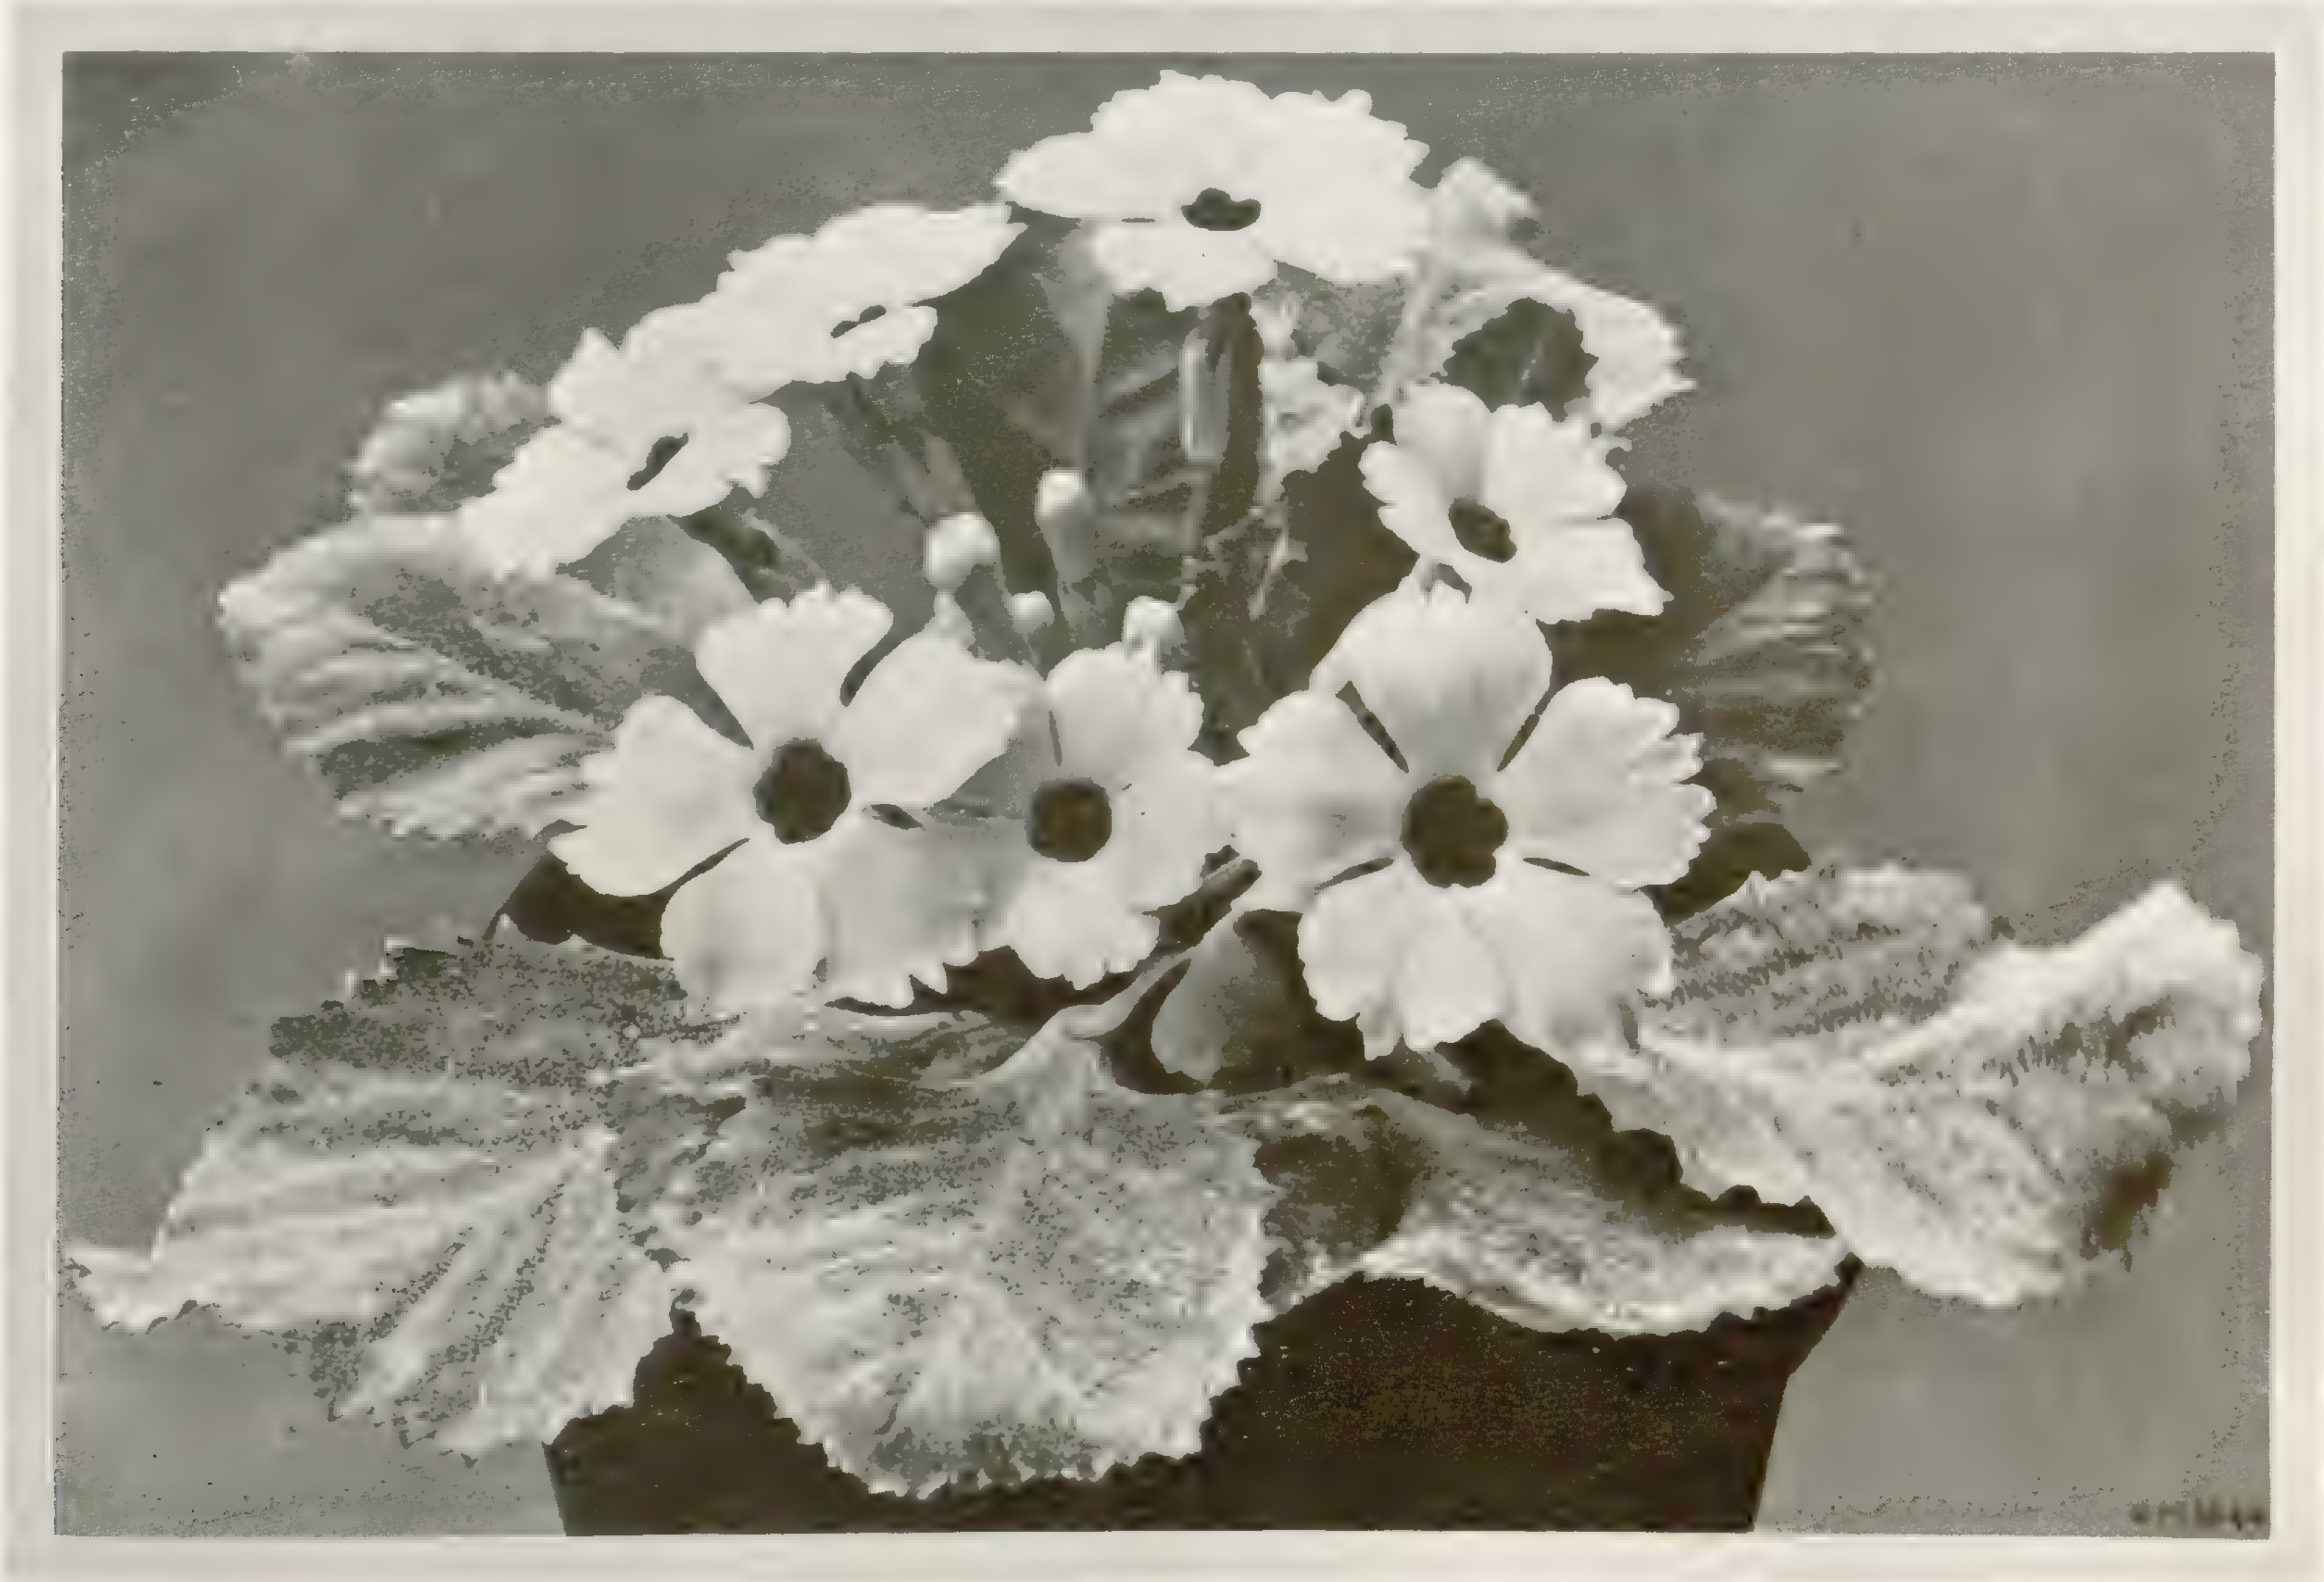
Swanage Horticultural Society, which was founded six years ago, has achieved much success, and accomplished much useful work in the promotion of gardening in the district over which its operations extend. A gratifying feature of the society's activity is the care with which the funds are handled. In looking through the balance-sheet for the past year we observe that the amounts disbursed in prizes and management expenses were about equal, and that the operations during the twelve months resulted in a substantial balance. This year the society is offering at its exhibition, to be held August 7, a challenge cup, of the value of twenty guineas, for a collection of fruit and vegetables, to consist of six dishes of the former and nine varieties of the latter. The schedule also contains eight or nine special classes for sweet peas, so that there should be good displays of these flowers, as well of other subjects.

ROYAL HORTICULTURAL SOCIETY.

There was a very full meeting at the Royal Horticultural Hall on Tuesday, February 28, and the exhibits were both numerous and interesting, while many of them were also beautiful. Novelties were not numerous, but the new hardy Primula Winteri attracted a great deal of attention. The Orchid Committee distributed botanical certificates to four species, but otherwise granted only an Award of Merit. Orchids, hardy plants, forced flowering shrubs, carnations, and cyclamens made up the bulk of the exhibition. Notwithstanding the wind and rain, there was a good attendance of Fellows.

FLORAL COMMITTEE.

Fine big vases of beautiful carnations from Mr. A. F. Dutton, Iver, Bucks, were greatly admired; Dutton's White Lawson, Beacon, Lawson-Enchantress, Mrs. H. Burnett, Mikado, May Day, O. P. Bassett, Harlowarden, and Rose Pink Enchantress were the leading varieties.



PRIMULA WINTERI.

A beautiful Himalayan species bearing lilac-coloured flowers. F.C.C., R.H.S., February 28. Also on same date F.C.C., National Hardy Plant Society. Messrs. R. Gill and Son.

The old Bletia hyacinthina, a hardy orchid in favoured localities, was very well shown by Messrs. Thomas S. Ware, Feltham. This firm had also goodly batches of Iris reticulata, Primula denticulata, P. malacoides, Pulmonaria rubra, saxifragas, Soldanella alpina, and other pretty alpines, etc.

Messrs. R. Gill and Sons brought up a fine lot of their wondrously beautiful rhododendrons from Penryn, Cornwall. There were R. arboreum, R. barbatum, R. Shilsoni, R. Thomsoni, R. cinnamomeum, and R. Duke of Cornwall. Violets and Cyclamen Coum were equally delightful, but the great attraction was Primula Winteri (F.C.C.), a low-growing species with clusters of lilac-coloured, white-centred blooms, surrounded by light green, mealy-powdered leaves; this new primrose comes from an elevation of 12,000ft. on the Himalayas; the plants shown were from seeds sown less than a year ago.

Messrs. J. Hill and Son, Edmonton, displayed a large and beautiful group of ferns.

Messrs. Robert Sydenham Limited, Tenby Street, Birmingham, brought a breath of spring into the hall with their daffodils, crocuses, and lily of the valley. Hilda, Cardinal, Bullfinch, Magpie, Oriflamme, and Evangeline were charming daffodils shown, the first-named being quite new.

Messrs. Joseph Cheal and Sons, Crawley, brought forward a small collection of alpine shrubs and plants, the primulas, Dog's-tooth violets, and anemones being the leading features.

Magnificent carnations were brought over from Guernsey by Mr. H. Burnett, the leading varieties so famously and extensively shown being Mrs. H. Burnett, Scarlet Glow, Snow Queen, J. W. Riley, Mrs. Sutton (pink), R. F. Felton—very fine indeed—Mikado, Marmion, Aurora, Britannia, and Niagara (a fine white).

Mr. C. Engelmann, Saffron Walden, had a bold exhibit of beautiful carnations, the flowers bright and large. Carola stood out conspicuously, and other grand varieties were Vinca, Regina, Harlequin, J. Whitcomb Riley, and La Mode.

Cyclamens were superbly shown by the St. George's Nursery Company, Harlington, Middlesex, and probably finer blooms have never before been seen at the hall.

Rhododendron præcox figured prominently in the group from Messrs. R. Wallace and Co., Colchester. Crocuses, heaths, Tulipa Kaufmanniana, T. Fosteriana, anemones, Primula denticulata, and a glorious colony of Iris reticulata and I. v. Krelagei made up a charming exhibit.

Very brilliant and effective groups of Indian azaleas from Mr. L. R. Russell, Richmond, constituted one of the features of the meeting: these beautiful shrubs were finely grown, smothered with glorious blooms, and were greatly admired. The azaleas were flanked by admirable examples of Jasminum primulinum—showers of golden flowers.

Choice crocuses, irises, and snowdrops, beautiful anemones, and a number of fine rhododendrons were exhibited by Mr. G. Reuthe, Keston, Kent.

The useful lachenalias were very well shown by Messrs. J. Peed and Son, West Norwood, who set up good batches of L. Cami, L. luteola, and L. aurea.

Azalea mollis, as shown by Messrs. R. and G. Cuthbert, Southgate, produced a rare blaze of colour. The freely-flowered plants were grouped in their colours with ferns, and over them all towered standards of Prunus triloba, laburnums, Staphylea colchica, lilacs, and various pyruses. Magnolia Soulangeana nigra was very conspicuous in this group.

The graceful Primula malacoides was unusually well shown by Mr. Harry Ward, Oak House Nursery, Southgate. The plants were in 48-sized pots, and they carried a profusion of many-tiered spikes of deep lilac or lavender flowers.

The bank of cyclamens from Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, showed that Mr. Beckett is a capable grower of indoor plants, as well as of shrubs, vegetables, etc.; the white and salmon varieties were well shown.

A very bright exhibit of early spring flowers from Messrs. Barr and Sons, Covent Garden, included a selection of hellebores, a delightful lot of crocuses, Rhododendron præcox, anemones, scillas, snowdrops, a batch of the lowly Cyclamen ibericum, with flowering plants of the graceful Primula malacoides.

The long table, well filled by Messrs. Jas. Veitch and Sons, Chelsea, was gay with freely-flowered Indian azaleas, Azalea amœna Hexe, the typical and the farinose forms of Primula Kewensis, the pretty Erlangea tomentosa, the fragrant Boronia megastigma, and a group of choice amaryllis, these latter including splendid forms in Hermia, Roscrea, Valetta, Jadera, Otanes, Cygnet, and Pavola. Forced flowering shrubs were delightfully and elegantly shown by Messrs. Jas. Veitch and Sons, Chelsea, and the quantity of lilacs shown in the big group added fragrance to colour and grace. Standard wistarias, dwarf rhododendrons, lilacs, pyruses, and Azalea mollis were admirably grouped with a few foliage plants. Amelanchier canadensis, Rosa Hugonis, and Prunus triloba were other fine things in the display. In another part of the hall Messrs. Veitch put up a group of Indian azaleas grown as standards.

A neat rock-garden display from Messrs. Heath and Son, Cheltenham, filled one corner of the hall, and very charming were the little groups of Primula malacoides, P. rosea, P. denticulata, coloured primroses, saxifragas in variety, crocuses, anemones, etc.

Blue primroses, some of very deep colour, were well shown by Messrs. G. and A. Clark, Dover, the firm also contributing white, yellow, crimson, and other varieties, as well as richly-hued polyanthuses and Primula denticulata.

Messrs. H. Cannell and Sons, Swanley, displayed a group of brilliant zonal pelargoniums, showing cut blooms of the choicest varieties; stellate cinerarias, and cyclamens in great variety of colours were also contributed.

Boronia megastigma and acacias, in the group from Messrs. Stuart Low and Co., Bush Hill Park, Enfield, dispensed a sweet fragrance with the help of Daphne indica; Primula malacoides and gerberas, and a bright display of perpetual carnations made up a considerable exhibit from this firm.

The display of forced bulbs set up by Mr. W. Howe, gardener to Lady Tate, Streatham Common, was very much admired. There were daffodils, tulips, and hyacinths, with deutzias and Azalea mollis, but the tulips were exceptionally good, notably such varieties as Keizerkroon, Prince of Austria, Mon Tresor, Sir Thomas Lipton, Lilian Sydenham, Fabiola, Pink Beauty, Rose Gris de Lin, Proserpine, White Joost van Vondel, Le Reve, and Duchesse de Parma.

Such fine carnations as Marmion, Mrs. Fortescue, May Day, Winsor, White Enchantress, Lady Coventry, Edna, and Lady Elphinstone were largely displayed by Messrs. W. Cutbush and Son, Highgate, the same firm also contributing a large collection of alpines and forced shrubs, the latter including forsythias, Corylopsis parviflora, Spiræa confusa, Azalea mollis, magnolias, and laburnum.

Some delightful blooms of Richmond and Lady Hillingdon roses, lovely in colour and form, were shown finely by Messrs. George Mount and Sons, Canterbury.

Lovely seedling irises of the I. reticulata group were sent up by Mr. F. H. Chapman, Guldeford Lodge, Rye, together with new daffodils named Treasure Trove and Lullaby.

Mr. W. Seward, of Hanwell, contributed a large exhibit of finely-grown cyclamens, the pure white and deep crimson forms being particularly good.

The bright exhibit from Messrs. Bakers, Wolverhampton, consisted of alpine flowers backed by bushes of Rhododendron præcox; Adonis amurensis, Anemone hepatica cærulea, Primula denticulata, Anemone ranunculoides, Saxifraga Burseriana, and Androsace coronopifolia were charming among the smaller flowers.

In the group of ferns exhibited by Messrs. H. B. May and Sons, Edmonton, were included the newer nephrolepises and a set of the exquisitely beautiful filmy ferns, such as Todea superba, T. radicans, T. r. cambricum, T. r. dissectum, Trichomanes auriculatum, T. Tunbridgense, T. candiculatum, T. Luschnathianum, T. scandens, T. reniforme, T. intermedia, T. grandipinnula, T. parvulum, and Hymenophyllum demissum.

A long table filled chiefly with semicircular groups of tulips, each group of one colour, was filled by Messrs. Sutton and Sons, Reading, and in this way the colour and value of a variety was emphasised. The tulips thus grouped were Sir Thomas Lipton, Orange Blossom, Apple Blossom, Meteor, American Lac, Pink Pearl, La Remarquable, White Forcing, Radiant Dawn, and Grace Darling. The centre of the display was filled with scarlet cinerarias, and the yellow Primula Kewensis.

Single primula blooms, removed from the trusses and set out on the flat do not look well, as a rule, but when such fine flowers as those shown by Messrs. C. Brooks and Son, Worting, Basingstoke, they are attractive; Giant Crimson, Giant Salmon, the vivid Brilliant King, a lovely Giant Pink, the pretty Orange King—which is rich pink in the open flowers, True Blue, and Ruby Queen were all very beautiful.

The group of early flowers from Mr. Maurice Prichard, Christchurch, was gay with crocuses, saxifragas, anemones, irises, primulas, violets, and other good things.

Messrs. R. H. Bath, Wisbech, showed how daffodils, tulips, crocuses, and hyacinths can be grown in fancy pots or bowls in a fibre and shell mixture; the crocuses, trumpet daffodils, and hyacinths were well represented.

A group of the pale-blue-flowered Eupatorium ianthinum, from Mr. Farmer, gardener to Mrs. Laschelles, Highams, Windlesham, was a reminder of the value of this old plant for winter decorations. Mr. Farmer also presented a noble group of the effective golden-spathed Richardia Elliottiana; there were nearly seventy fine spathes in this group.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, put up a brilliant group of orchids in which odontoglossums and odontiodas were very graceful and beautiful, the former included O. crispum, O. armainvilliersense, O. Rolfæ, O. Edwardi, O. Gladys, O. Wilckeanum, and O. Ardentissimum; while among Odontiodas there were O. Bradshawiæ, O. Lutetia, and O. heatonense. Other things in good form were Phaius Norman aurea, Miltonia Bleuana nobilior, M. Warscewiczi, Lælio-cattleya Doris, L.-c. Luminosa, Brassocattleya Queen Alexandra, and Cœlogyne sparsa.

Some well-grown plants of Cypripedium aureum Surprise, C. villosum auriferum, C. aureum Virginale, C. a. Œdippe, and C. chrysotoxum, from Mr. E. V. Low, Vale Bridge, Haywards Heath, were greatly admired.

A very pretty group of orchids from Messrs. Armstrong and Brown, Tunbridge Wells, contained excellent examples of Odontoglossum Rolfæ, O. crispum, O. Queen Alexandra, Odonitoda Bradshawiæ, Masdevallia Schroderæ, Dendrobium Artemis, Cypripedium aureum, and other good things.

Odontoglossum crispum in variety, from Messrs. J. and A. McBean, Cooksbridge, were greatly admired; with these were Cymbidium insigne, C. Lowio-eburneum, and Epiphronitis Veitchi.

Mr. A. W. Jensen, Lindfield, Haywards Heath, showed a few plants of good varieties of Cattleya Trianæ.

A small group of cypripediums was staged by Mr. Carr, gardener to E. Roberts, Esq., I.S.O., Park Lodge, Eltham; C. Emile Cappe, C. Euryades, C. Sir Redvers Buller, C. Beechense, and C. St. Albans were the best things.

In the corner of one of the annexes Messrs. Mansell and Hatcher, Rawdon, Yorks, had a goodly display of orchids, in which Miltonia Bleuana grandiflora, Dendrobium amethystoglossa, D. nobile, D. n. nobilius, Odontioda Zephyr, Grobya fuscifera, and Eria lanata were represented.

Some grandly grown cypripediums were brought forward by Messrs. J. Cypher and Sons, Cheltenham; C. Bridgei, C. Graciæ, C. Miss L. Fowler, C. aureum Surprise, C. Beekmani, and Lælio-cattleya Cappei were all good.

Mr. Black, gardener to R. Thwaites, Esq., Streatham, sent up numerous hybrid dendrobiums, the yellow D. Chessingtonense showing up well.

The graceful Dendrochilum glumaceum pallidum (B.C.), the pretty Masdevallia Chamberlainiana, and such curious species as Dendrobium delicatum (B.C.), Maxillaria calychroma (B.C.), in the way of M. luteoalba, Catasteum Scurra, and Pleurothallis scapha, were all shown by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

Mr. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, sent up a beautiful form of Odontioda Bradshawiæ, a pretty seedling Odontoglossum percultum, and the richly-hued Dendrobium Oakwoodiensis.

Mr. J. Gurney Fowler, Glebelands, South Woodford, sent a fine plant of the brilliant Odontioda Keighleyensis, carrying a spike of about fifty flowers.

Messrs. Sander and Sons, St. Albans, brought up a nice lot of orchids, and here the leading features were Odontoglossum Edwardi, O. excellens, O. percultum, Cypripedium Maudiæ, C. aureum Hyeanum, Phalænopsis Stuartiana, Cattleya Thayeriana, and the graceful Cymbidium Holfordianum.

Dendrobium Wardianum formed the centre of a group of orchids from Messrs. Stuart Low and Co., Enfield; this batch was flanked by Angræcum sesquipedale, Cattleya Trianæ, Lycaste Skinneri, Dendrobium atro-violaceum, masdevallias, etc.

Messrs. Jas. Veitch and Sons, Chelsea, submitted an attractive hybrid between Cymbidium Lowianum and C. Devonianum, named C. Veitchi (A.M.); this had a long spike of brownish-green flowers, and a rich purple-brown lip.

FRUIT AND VEGETABLE COMMITTEE.

Kales, green and coloured, some of great use in the kitchen, and others so gaily coloured that their position seemed to be the flower garden; Arctic Green, A1, Hardy Sprouting, Sutton's Hybrid were all green varieties of great value.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Primula Winteri, from Messrs. R. Gill and Sons, Penryn, Cornwall.

Award of Merit.—To Cymbidium Veitchi, from Messrs. Jas. Veitch and Sons, Chelsea; to Saxifraga Bursiculata, from Mr. E. H. Jenkins, Hampton Hill.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for miscellaneous flowering plants; to Mr. L. R. Russell, Richmond, for azaleas.

Silver-gilt Flora.—To Messrs. Wm. Cutbush and Son, Highgate, for carnations, hardy flowers, etc.; to Miss Gundry, Foot's Cray, for flower paintings; to the St. George's Nursery Company, Harlington, Middlesex, for cyclamens; to Mr. Howe, gardener to Lady Tate, Streatham Hill, for forced bulbs.

Silver-gilt Banksian.—To Messrs. J. Hill and Sons, Edmonton, for ferns; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Mr. W. Seward, Hanwell, for cyclamen.

Silver Flora.— To Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Charlesworth and Co., Hayward Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. H Burnett, Guernsey, for carnations; to Messrs. R. and G. Cuthbert, Southgate, fo forced shrubs; to Mr. Farmer, gardener to Mrs. Laschelles, Windlesham, for yellow arums, etc.; to Messrs. Stuart Low and Co., Enfield, for carnations, etc.; and to Mr. G. Reuthe, Keston, for hardy flowers.

Silver Banksian.—To Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs J. and A. McBean, Cooksbridge, for orchids; to E. Roberts, Esq., Eltham, for orchids; to Messrs. Ba and Sons, Covent Garden, for hardy flowers to Mr. A. F. Dutton, Iver, for carnations; to Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, for cyclamen; to Messrs. George Mount and Sons, Canterbury, for roses; to Messrs. J. Peed and Sons, West Norwood, for lachenalias, etc.; to Mr. Maurice Prichard, Christchurch, for hardy flowers; to Messrs. Sutton and Sons, Reading, for tulips; to Messrs. Thomas S. Ware, Feltham, for hardy flowers; to Mr. C. Engelmann, Saffron Walden, carnations.

Bronze Flora.—To Messrs. H. Cannell and Sons, Swanley, for pelargoniums, etc.; to Messrs. G. and A. Clark, Dover, for alp etc.; to Messrs. R. Gill and Sons, Penry for rhododendrons, etc.

Bronze Banksian.—To Messrs. Bakers, Wolverhampton, for hardy plants.

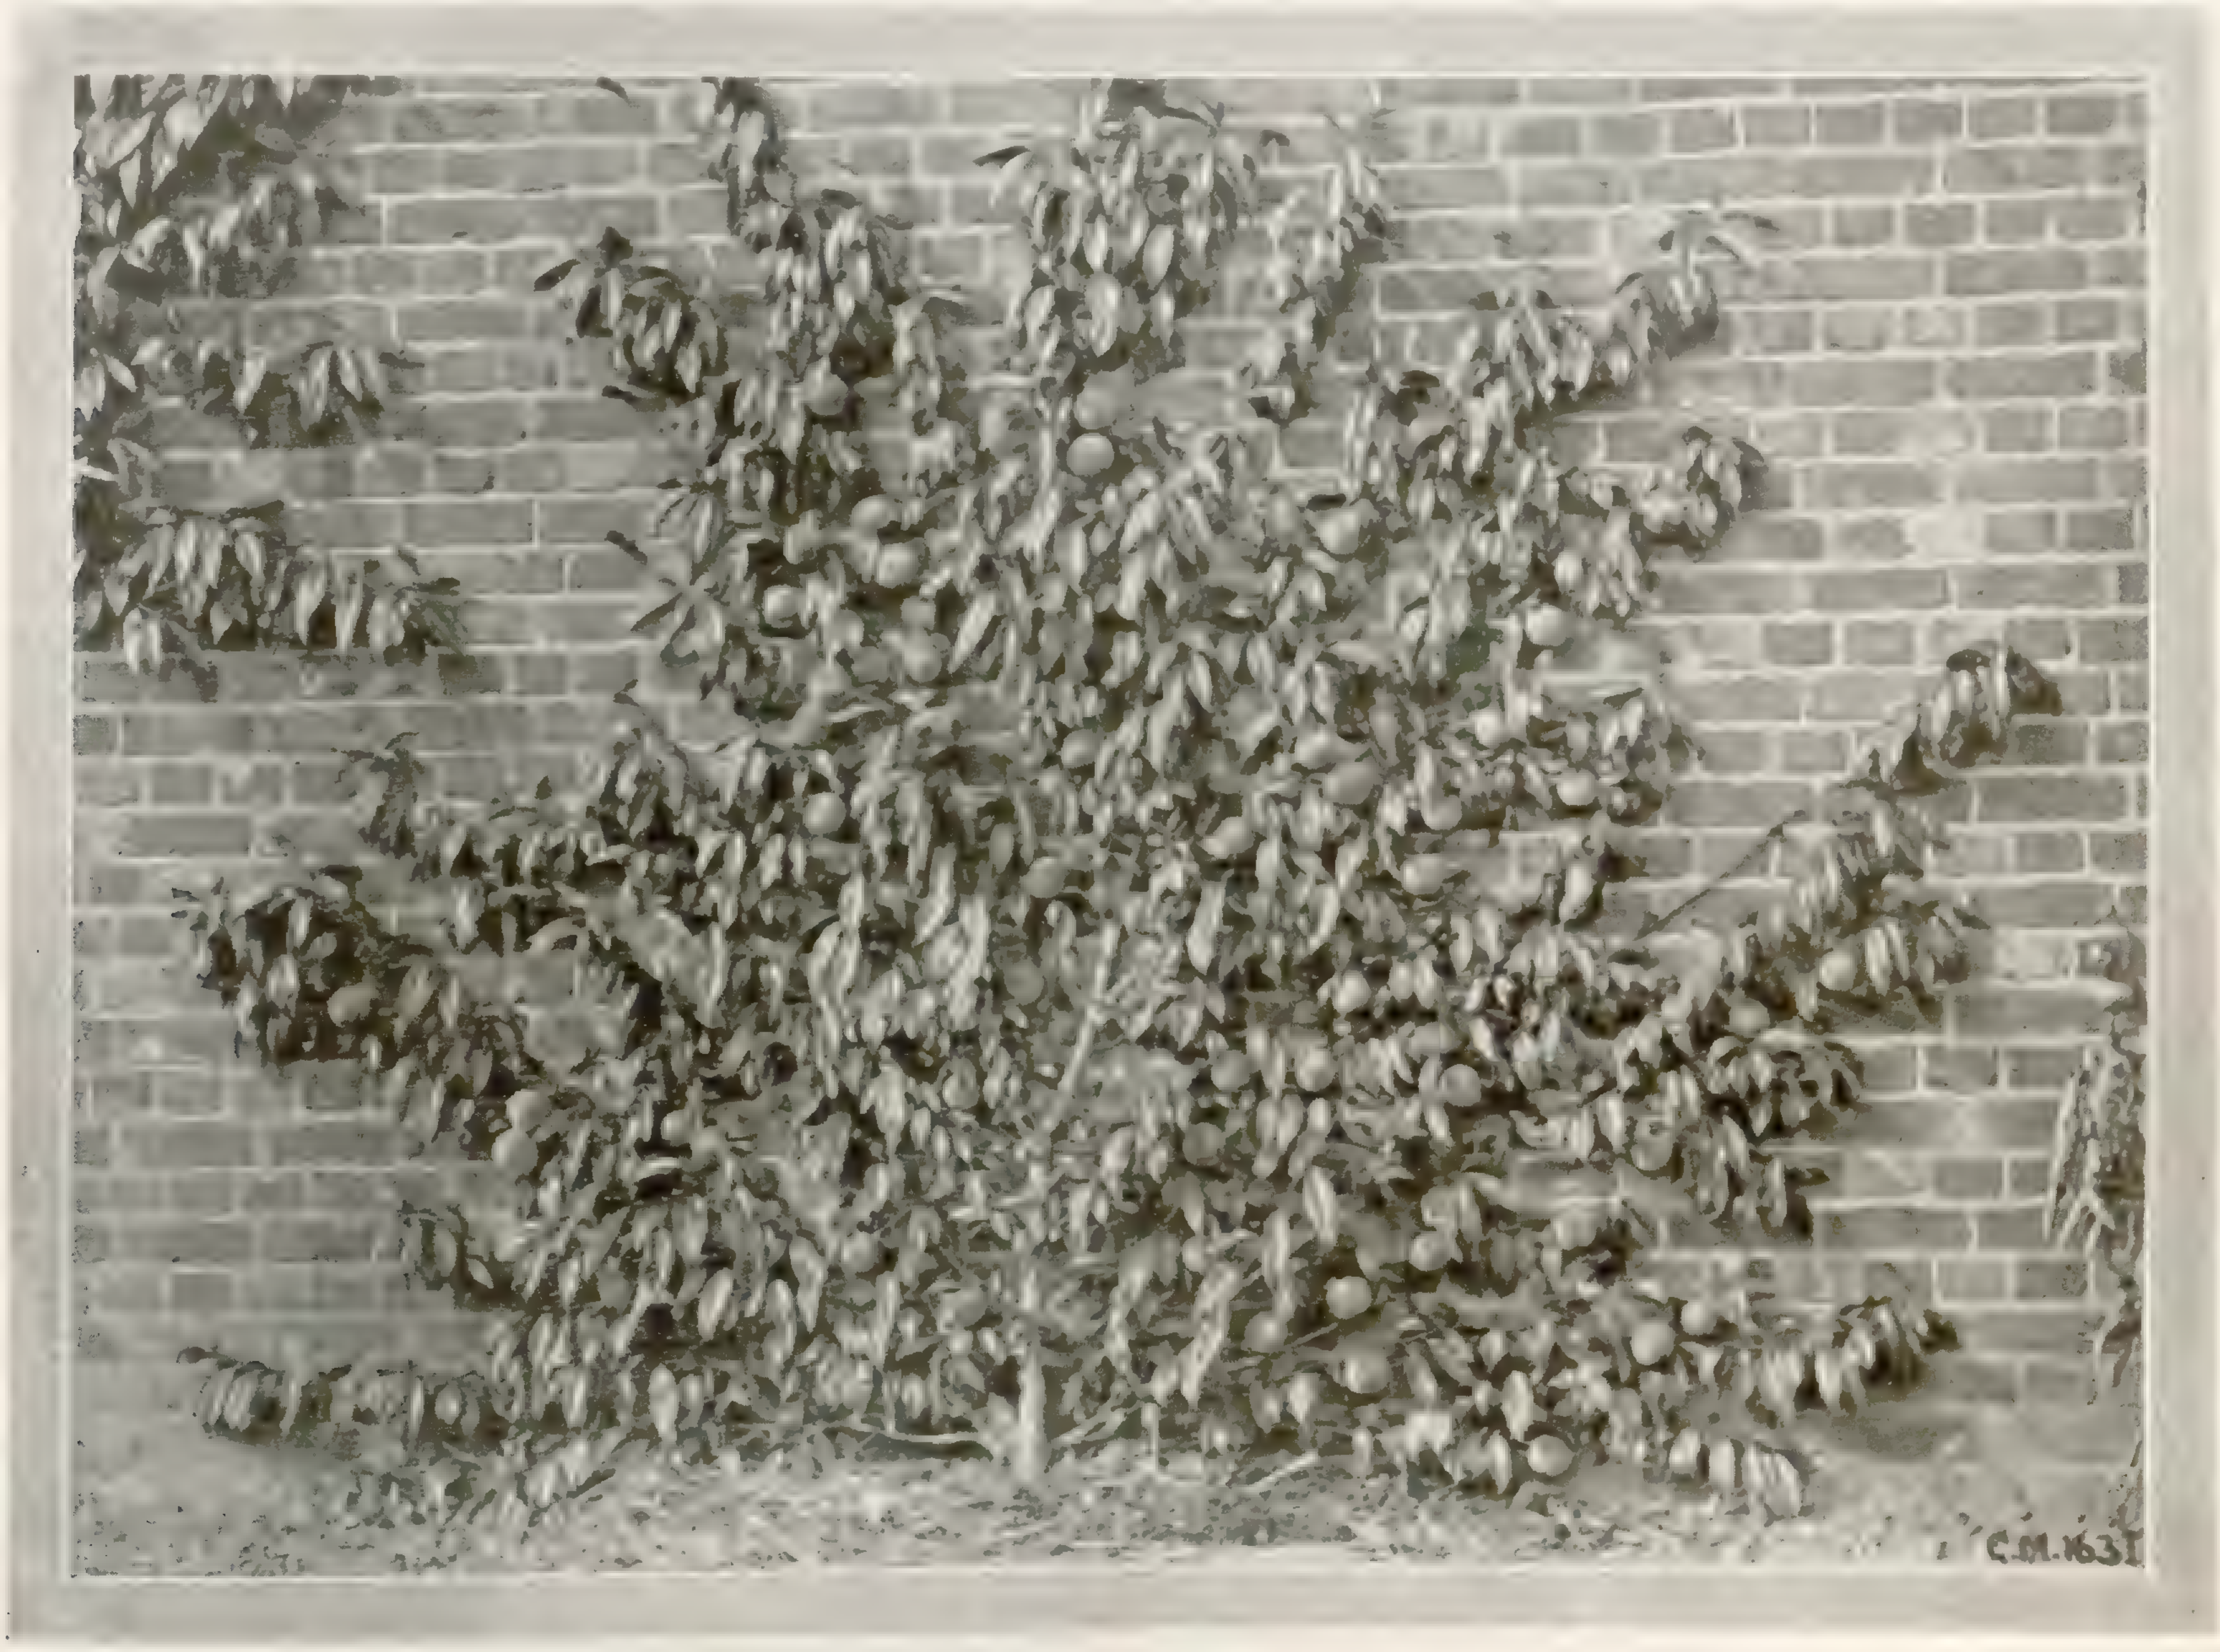
PEACH LIBRA.

I have been very much interested in the several notes on the Peach Libra that have appeared in the Gardeners' Magazine, and was more than surprised to read that this variety was unsatisfactory at Sutton Place, as it has been just the opposite in my own experience.

I was recommended to try this variety several years ago by Mr. Lock, of Oatlands Park Gardens, Weybridge, and, not having room for it indoors at the time, I purchased a young tree, and planted it on a wall facing south-east. Here it did splendidly, and has carried a good crop of fruit every season since. The colour, texture, and flavour of the fruit are all that one could wish for out of doors, and with us the fruits are of more than average size, notwithstanding the fact that the soil in this garden is of a particularly cold and heavy nature, and the roots must be standing in water once or twice during an ordinary winter, or at least as often as the Thames rises above its normal level.

The accompanying photograph shows the tree in question two seasons ago, and it is in a much better condition now than then,

Thomas Stevenson.



A TREE OF LIBRA PEACH
In the gardens of Woburn Place, Addlestone.

Border Carnations may be planted in their flowering quarters, providing the soil is workable. The ground, which has been dug previously, should be made firm and raked level, and the plants put out eighteen inches apart each way. The surface soil of autumn-planted beds should be slightly stirred with the hoe during dry weather, and all blanks should be made good. An occasional dusting with soot is beneficial; it will keep the foliage in good colour and assist in keeping down disease.—E. C. P.

NOTES FROM KEW.

◆

Rhododendron Prince Camille de Rohan.

This has the reputation of being one of the best of all the evergreen rhododendrons for forcing, in which state it is very valuable for decorations. This good name is well borne out by the specimens in the greenhouse at Kew, where some fairly large bushes are freely laden with their attractive blossoms. In the production of this particular variety, R. caucasicum has, I should say, played an important part. It forms a shapely, compact bush, and the flowers are very freely borne. They are white, with a suffusion of blush, while the upper part of the interior is densely freckled with red. In addition to this, the edges of the petals are prettily crisped. These hardy rhododendrons are very valuable for greenhouse decoration during the early months of the year, but many of them will prove unsatisfactory if subjected to hard forcing. In addition to Prince Camille de Rohan, one of the most readily forced is that generally grown as Cunningham's White, but which is, I believe, synonymous with R. caucasicum album.

Begonias.

One can scarcely overestimate the important part played by begonias in our glass houses at all seasons of the year. Throughout the summer months the innumerable tuberous-rooted varieties, with representatives of many species, serve to maintain a bright display, and in autumn a succession to the ordinary tuberous-rooted kinds is formed by the several hybrids with them and B. socotrana. With these come B. Gloire de Lorraine and its forms, which, commencing to bloom in the autumn, are both in the greenhouse and in the intermediate portion of the T-range as bright and effective as ever. These are by no means the only begonias just now in an attractive state, for among the many in bloom may be especially mentioned B. Gloire de Sceaux, a bold, bushy plant, with handsome bronzy leaves and rose-coloured flowers; B. semperflorens gigantea, an old hybrid between B. semperflorens and B. Lynchiana (or Roezli), as it was at first called. This has bright rose-carmine flowers, which are borne nearly, if not quite, throughout the year.

B. manicata, introduced from Mexico as long ago as 1842, is still well worth growing where a display of flowers has to be kept up. This has large, handsome, shining green leaves, the stems and the under-sides of the principal veins being studded with broad red scale-like hairs. The flowers are borne in large branching cymes, and, as they well overtop the mass of handsome leafage, they are seen to considerable advantage. The blossoms are not large, but very numerous, and pale pink in colour. Some of the individuals at Kew appear to me superior to those generally met with. Singularly enough, there are two varieties of B. manicata, remarkable for their distinct leafage, one in which the leaves are freely blotched with yellow, and the other in which they are crested in a peculiar manner, almost suggesting some of the kales. Another species—B. pruinata, from South America—is a good deal like B. manicata, but the leaves are without hairs, and the flowers are pure white. The excessively shiny leaves of B. conchifolia, with its pretty pink blossoms, also attract attention; while B. scabrida, a free-growing, bushy species with comparatively small leaves and a profusion of white blossoms, is very useful.

This note might be considerably extended, but enough has been given to show the great variety that exists among begonias, and the value of many of them for winter blooming.

Cynorchis compacta.

This is the name of a charming little terrestrial orchid, flowering most profusely in the cool orchid house. It is nearly related to the habenarias, and, like them, produces a small tuber, from whence is pushed up the flower-scape, which reaches a height of about 6in., and has one or two partially-unfolded leaves at the base. The flowers are numerous and pure white, and when several bulbs are grouped in a shallow pan they make a goodly show.

Aphelandra Chamissoniana.

Some examples of this pretty aphelandra now in the intermediate portion of the T-range arrest attention by reason of their bright chrome-yellow tint, whereas most of the aphelandras are of some shade of red or scarlet. A. Chamissoniana is a rather tall, slender-growing species, clothed with leaves about 4in. long. These have a broad white band along the midrib, while the greater part of the leaf is freckled with white. The inflorescence consists of a large head of bracts, from whence the flowers are produced. The flowers are, as above stated, yellow, while the bracts are, with the exception of a green tip, of much the same colour. This aphelandra was first distributed under the name of A. punctata, and as such it is still sometimes met with in gardens.

BEDDING PLANTS GROWN AS ANNUALS.

(Concluded from page 151.)

◆

Balsams

are not much grown nowadays, and those who have only seen half-staved plants can form no idea of the beauty of the best double camellia-flowered forms when well grown on a sunny bed of rich soil. Seed should be sown in February in a compost of turfy loam and spent hotbed in equal proportions, and the seedlings potted up and grown on in sixties till all danger of frost is over, as they are very tender. The plants should be given plenty of space to show up the flowers down the stems under the leaves, the ground between being carpeted with low-growing plants, such as creeping jenny, or white lobelia.

Dianthus and Alonsoa.

Dianthus Heddewigi, both single and double, make good beds. They need a light rich soil in a good position, and when well grown are very effective, the colours ranging from pure white to the richest crimson, while some are laced and striped. Forward plants will keep up a good show from July to late September.

Those who like uncommon beds might grow Alonsoa. It is one of the smallest of plants in the seed-leaf stage, and needs careful raising, but otherwise is not difficult to grow if given good cultivation. Though the flowers are small the effect in the mass is very bright in fine weather. A large proportion of the blossoms, however, are knocked off by even a moderate shower.

Zinnias.

Zinnias must be mentioned, as they are so often grown for the sake of the unusual colours of their blossoms, but they are rarely a success, needing a light rich soil in a good position if they are to do well even with the best treatment. As usually grown they are distinctly lacking in grace. There should always be a border round the bed to conceal a part of their stems. Antirrhinums are specially useful where a spring bed is not ready to take up till June is well advanced, when plants from pots will make a good show from late July till October.

Edging Plants.

Apart from the conventional lobelias and ageratums, one of the best plants is the French marigold, in one of its more beautiful forms of self orange or crimson and yellow striped, and, closely allied to it, Tagetes signata pumila. Like their relative named from Africa they light up the garden in late summer and autumn, though they begin at the end of June. All are very tender. Sanvitalia procumbens is a low-spreading plant with flowers like small sunflowers. In a light rich soil, in a good position, it makes compact tufts covered with small flowers all the summer. Alyssum maritima, with its dwarf habit and white flowers, is most useful both for carpeting beds, as shown in the illustration given in the last issue, and for marginal bands.

Alger Petts

Sweet Peas.—The first sowing in the open may be made at once, providing the ground is in good working order. Should the soil be at all sticky, it will be best to defer the operation for a few days until better conditions prevail. For rows, drills should be drawn out nine inches wide and about three inches deep, sowing the seeds in them thinly. It is a common error with many to grow too thickly; the plants cannot develop properly, the growth becomes stunted, and the flowers are naturally of an inferior quality. Before sowing, it is necessary to dress the seeds to prevent the depredations of mice, birds, etc. Red lead is a very good thing for this purpose, and there is now an excellent preparation on the market, recommended as a seed dressing, not only for sweet peas, but for other seeds.—E. C. P.

Make your Garden a delight by using

CANARY GUANO.

There is nothing like it for producing the best possible results in the garden. For improving Lawns, increasing the size and brilliance of Flowers, and producing heavy yields of Vegetables there is no Fertilizer that has given such excellent results. Canary Guano is sold by practically all Seedsmen throughout the United Kingdom and is used all over the world. TRY IT.

PARSLEY.

Parsley constitutes one of the most important of our kitchen garden crops, and good parsley is needed daily in many establishments. Both summer and winter the demand is almost equally large, as this herb is alike useful for garnishing and flavouring. To those of us who are exhibitors, a good bed of parsley from which to draw a supply is a great boon when staging a collection of vegetables, and when this is of a good variety, perfect in colour and form, it adds that finishing touch unequalled by any other subject. Every effort, therefore, should be made to have a good supply of parsley for particular dates, when it is known to be specially in request; in addition to this endeavour to maintain a good supply at all seasons.

A FINE BREADTH OF PARSLEY,
As grown by Mr. E. Beckett, V.M.H., in the Aldenham House Gardens.

As for all other crops, it is essential that the ground be well worked, or the best results cannot be expected. Trenching or digging should be undertaken during the winter months, and if the ground is poor a liberal dressing of well-decayed manure must be worked in, but an excess of this must be guarded against, or an unduly gross growth will be formed, ugly in appearance, and useless. Parsley prefers a good heavy soil, that is retentive, and a position where it can receive plenty of sun, and, generally speaking, under these circumstances will make a luxuriant growth. On light soils, and especially those that are shallow and well drained, rather choose a position that is shaded.

For planting out of doors the first sowing should be made towards the end of February or at the beginning of this month. Sow in a box filled with a light compost, and stand in a house with a slight heat, such as an early vinery or peach house. Well water in with a fine rose can. Upon germination remove to a cooler structure, and place in full light. On light soils, if the seed was sown thinly, the seedlings may be placed out direct from the seed boxes, but on heavy soil, where it is difficult to obtain a good tilth I prefer to prick out the plants into other boxes, and grow on coolly, giving abundance of air whenever possible. Planting should be carried out as soon as seasonable during the month of April. Choose suitable weather so that the ground may be well raked down. Plant twelve inches apart each way, and when completed give a dusting of soot, as this, besides being invaluable as a fertiliser, does much to repel attacks of slugs. The crop will require but little further attention beyond frequent hoeings with the Dutch hoe, to keep down weeds and aerate the soil. If a dusting of soot is applied at intervals during showery weather this will also do much towards improving the colour.

Later sowings should be made out of doors, and from these one may expect to obtain a supply through the winter months. I usually make three sowings out of doors, one in April, another in June, and the final in August, and from the latter draw my plants when large enough for lifting and planting in frames either cold or on old hotbeds, where protection can be given them during hard and snowy weather. The plants, when treated in this manner, should be put out six inches apart, and, whenever possible, receive abundance of air, and at intervals the surface soil should be stirred and yellow and decaying leaves removed. Failing this, if one has not the convenience of frames, temporary shelter may be erected over the bed by placing some boards round the outside, and using a cover when necessary, and preferably the use of some old lights.

Excellent material, too, can often be procured from plants under a south wall. At all seasons of growth any plants that tend to throw up flower spikes should have these removed. Always cultivate a good variety. It is astonishing what a difference exists in the strains. Select one of a good colour, with large, well-curled leaves. Two of the best varieties with which I am acquainted is Dobbie's Exhibition Curled and Fern-leaved.

E. Beckett, V.M.H.

GOOSEBERRY BERRY'S EARLY KENT.

Soon afer this variety was placed on the market, I planted a number of young trees, and found it to be everything that was claimed for it. But I wish here to particularly refer to the pruning of gooseberries — autumn and spring pruning, and the effect generally of early autumn pruning —as it was with this variety that I experimented a little. Almost before all the leaves had fallen off one autumn, I pruned several bushes; the remainder of this particular variety, and all others making up a large plot, were left unpruned until the spring, birds being so numerous and troublesome in the garden. Well, I found the result of the early autumn pruning to be as follows: The pruned bushes were left severely alone by the birds, I do not know why; the new shoots were ten days earlier than those on the spring-pruned bushes, very much stronger, too; the berries were quite one-fifth larger, and, of course, a week earlier. So I pruned some bushes in the autumn and the remainder in spring afterwards and never regretted doing so, as I secured earlier and larger crops, but in common with other cultivators, lost a few buds through the birds.

Geo. Garner.

OUTDOOR STRAWBERRIES.
